PREFACE

Welcome to the official e-proceedings of the International Conference in Education-Technical & Vocational Training 2025 (iCiE-TVET 2025). We are excited to present this vibrant collection of research, which reflects the success of the conference and the collaborative spirit of everyone involved. Under the timely theme, "Transformative Pathways: Bridging Skills, Technology, and Sustainability in TVET," this publication captures the insightful discussions and innovative ideas shared during the event. It is more than just a record; it is a valuable resource designed to expand the reach of the research presented and inspire ongoing progress in the TVET field.

Our sincere thanks go to all the authors who contributed their research, the presenters who sparked engaging discussions, and the dedicated reviewers who upheld the academic standards of this work. We also extend our heartfelt congratulations and gratitude to the organizing committee, led by Cendana Polytechnic, along with our esteemed co-organizers: Tuanku Sultanah Bahiyah Polytechnic, Metro Tasek Gelugor Polytechnic, and Arau Community College. Your hard work and dedication were key to making this event a great success. We invite you to explore the diverse and insightful papers within these pages, confident that they will make a significant contribution to the ongoing transformation of TVET.

CONTENTS

MECHANICAL ENGINEERING

DRONES IN LOGISTICS: THE CHALLENGES AND IMPACTS FOR DELIVERING THE FUTURE 1 – 7
Farah Wahida Rabu

KEBERKESANAN PENGGUNAAN THERMOCUBE DALAM UJIAN BIOLOGIKAL DI KLINIK PERGIGIAN 8 – 14
Mohd Zaniel Mahadzi, Azahar Mohd Noor, Syaiful Nizam Ab Rahim

THERMAL ANALYSIS OF ENGINE PISTON WITH THERMAL BARRIER COATING USING THE FINITE ELEMENT METHOD 15 – 23
Mohamad Alif Hafizzudin Mohamad Zailani, Baizura Zubir@Zubair, Ahmad Fauzie Abd Rahman

REKABENTUK MESIN PENGGELEK DOH BERASASKAN PENILAIAN ERGONOMIK (RULA DAN REBA) 24 – 29
Nik Noor Zilawati Nik Ab Rahman, Sahrijan Ahmad, Rozeah Ramlee

SMART PARCEL BOX: AN IOT AND RFID-BASED SOLUTION FOR SECURE PACKAGE DELIVERY 30 – 40
Zafarida Kadir, Mohamad Arif Fikri Nordin, Ahmad Rusdy Azzim Zulfazli, Naavin Ramani

MATHEMATICAL MODELLING ANALYSIS OF FLAT PLATE BASE-THERMAL CELL ABSORBER (FPBTCA) 41 – 50
Muhammad Amin Harun, Zafri Azran Abdul Majid, Zairul Azrul Zakaria

ELECTRICAL AND ELECTRONICS ENGINEERING

INNOVATIVE EDUCATIONAL KIT DEVELOPMENT FOR PLC AND IOT INTEGRATION IN TECHNICAL VOCATIONAL EDUCATION 51 – 59
Nurul Malihah Marzuan, Norsyira Zuraiza Omar, Rahimah Abdul Rahman

DESIGN OF IOT GARBAGE MONITORING WITH WEIGHT SENSING 60 – 65
Anira Abdul Rashid, Noor Akmalun Nisa' Man

REAL-TIME FAMILY TRACKING USING GPS TECHNOLOGY 66 – 71
Noor Akmalun Nisa' Man, Roslina Saad, Anira Abdul Rashid

KEBERKESANAN PENGGUNAAN PERISIAN LIVEWIRE DALAM MENINGKATKAN PEMAHAMAN PELAJAR TERHADAP TOPIK PEMASA 72 – 77
Roslina Saad, Syuhaila Mustafa, Mohd Huzaimi Md Hussin

FAKTOR-FAKTOR YANG MEMPENGARUHI PERSEPSI PELAJAR TERHADAP AMALI KEJURUTERAAN ELEKTRIK SECARA JARAK JAUH: SATU KAJIAN KES DI POLITEKNIK SEBERANG PERAI 78 – 84
Syuhaila Mustafa, Roslina Saad, Mohd Huzaimi Md Hussin

CIVIL ENGINEERING

ECO LUMINOUS PAVEMENT 85 – 89
Airiel Afiez Khairolazmy, Muhammad Syakir Ahmad Abu, Sheikh Yusuf Al-Hamdani Sheikh Ahmad Rafaei, Ajlaa Anis Azmi

KAJIAN KEBERKESANAN PENGGUNAAN PERENGKOH PAIP ERGONOMIK 90 – 95
Noor Azilla Md Radzi, Ts. Mohd Syafaril Jamaluddin, Norhayati Yusof

COMMERCE

THE INFLUENCE OF PRICE AND SERVICE QUALITY ON CONSUMER PURCHASE DECISIONS AT GERAI HANIA ONLINE STORE IN MEDAN CITY 96 – 109
Fitri Amalia Nst, Cece Cece

ADAPTING TO THE DIGITAL SHIFT: E-INVOICING AND TAX REFORM IN MALAYSIA 110 – 118
Charanjeet Kaur Amtar Singh, Haliza Aziz

APPLICATION OF SALES BUDGET IN ESTIMATING SALES AT DUDUKIN COFFEESHOP 119 – 127
Viona Saskia Putri, Nurhayati

THE INFLUENCE OF ONLINE MEDIA AND MARKETPLACE ON PRODUCT SALES AT CV ALKENA STORE 128 – 136
Adelia Nurmawati Sitohang, Mahendra Mahendra

THE EFFECT OF PRICE AND PRODUCT QUALITY ON PURCHASE DECISION AT CAFE MIE AND YOU LUBUK PAKAM 137 – 142
Nurhaliza Nurhaliza, Anggia Arif, Yuni Shara, Muhammad Syahrizal

THE INFLUENCE OF PRODUCT QUALITY, SERVICE QUALITY ON CUSTOMER LOYALTY AT ODDETE RESTO 143 – 150
Yulia Mahendra, Dewi Anggraini, Adrian Adrian, Cindy Cindy

THE INFLUENCE OF PRODUCT QUALITY AND CUSTOMER EXPERIENCE ON PURCHASE DECISIONS AT SENORITACOFFEE.21 MEDAN 151 – 157
Irene Jesica, Arwin Arwin

THE INFLUENCE OF SERVICE QUALITY AND PRODUCT QUALITY REGARDING PURCHASING DECISIONS AT VEGETARIAN THANKSGIVING MEDAN VEGETARIAN 158 – 164
John Nelson, Dewi Anggraini

THE INFLUENCE OF PRODUCT QUALITY, SERVICE QUALITY, AND PURCHASING DECISIONS AT CAFE LIMA SATU 165 – 171
Elsa Ayunda Kisuanto, Sutarno Sutarno

THE EFFECT OF CUSTOMER VALUE, SERVICE QUALITY ON CUSTOMER LOYALTY AT STRAWBERRY VEGGIE 172 – 179
Ratna, Tasik Utama

THE EFFECT OF COMMUNICATION AND WORK DISCIPLINE ON EMPLOYEE PERFORMANCE AT PT. CIPTAMANDIRI AGUNG JAYA AT MAHA VIHARAMAITREYA MEDAN 180 – 185
Acia Acia, Weny Weny

THE EFFECT OF PRODUCT QUALITY, SERVICE QUALITY ON PURCHASE DECISIONS AT BRADE SPRAYER 186 – 191
Teguh Gunawan, Fahmi Sulaiman, Mustika Sari

THE EFFECT OF SERVICE QUALITY AND PRODUCT QUALITY ON PURCHASE DECISIONS AT TAI WOK MEDAN VEGETARIAN 192 – 198
Joni Kim, Elserra Siemin Ciamas

THE INFLUENCE OF SERVICE QUALITY AND CUSTOMER TRUST ON CUSTOMER LOYALTY AMONG SHOPEE USERS IN MEDAN CITY 199 - 205
Michelle Monica, Weny Weny

SERVICE QUALITY ON CUSTOMER SATISFACTION IN FAMILY POULTRY FARM 206 – 211
Jessica, Ngajudin Nugroho, Fauzi Akbar Maulana Hutabarat, Wili Chandra

EMPLOYEE JOB SATISFACTION REVIEW IN 2019 AT AGIA SOPHIA ELEMENTARY SCHOOL (SD) DELI SERDANG 212 – 216
Tiurma Siahaan, Elsera Siemin Ciamas, Supriyanto Supriyanto

THE INFLUENCE OF INFORMATION TECHNOLOGY, INFLUENCERS, AND CUSTOMER RELATIONSHIPS ON ATTRACTING VISITORS TO THE BEAUTY IN THE POT MEDAN RESTAURANT 217 – 223
Roma Ruli Ana Sihotang, Cece
DEVELOPMENT OF A WEB-BASED POINT OF SALES (POS) INFORMATION SYSTEM FOR COFFEE SHALTER 224 – 230
Nopita Sari Br Tarigan, Guidio Leonarde Ginting
DESIGNING THE ERLANGGA SHOP WEBSITE AS A PROMOTIONAL AND INFORMATIVE PLATFORM TO IMPROVE BRAND AWARENESS AND SALES 231 – 237
Juwita Dipanti, Guidio Leonarde Ginting
IMPACT ANALYSIS OF THE USE OF E-WALLET APPLICATIONS ON CHANGES IN ONLINE SHOPPING HABITS IN THE DIGITAL ERA 238 – 244
Yudi Indra Pratama, Robbi Rahim
THE INFLUENCE OF VIRAL MARKETING AND FEAR OF MISSING OUT (FOMO) ON IMPULSIVE BUYING ON E-COMMERCE PLATFORMS (TIKTOK SHOP) 245 – 248
Ratu Valana Dewi, Riandani Rezki Prana
THE EFFECT OF EXPERIENTIAL MARKETING AND EMOTIONAL BRANDING ON CUSTOMER LOYALTY OF PT CAHAYA BINTANG HOLIDAYS 249 – 254
Sri Ayu, Riandani Rezki Prana
THE INFLUENCE OF TRUST LEVEL AND SHOPEE PAYLATER FACILITIES ON GEN Z STUDENTS' PURCHASE DECISIONS 255 – 260
Wulan Fitri Nasution, Sixson Roberto Simangunsong
STRATEGIES FOR MANAGING PRODUCTION COSTS AND SETTING SELLING PRICES TO INCREASE THE INCOME OF SMALL FISHING BOAT MANUFACTURING BUSINESSES IN BELAWAN 261 – 267
Khairuna, Wendi Amsuri Nasution
THE INFLUENCE OF CONSUMER PERCEPTION AND BRANDING STRATEGY ON THE SUSTAINABILITY OF MOTORIZED PEDICAB TRANSPORTATION SERVICES IN BINJAI CITY 268 – 275
Silvi Hinnai, Ihsan Iskandar
THE INFLUENCE OF OWN CAPITAL, LOAN CAPITAL, AND LENGTH OF BUSINESS ON MSMES INCOME IN MEDAN BARU DISTRICT 276 – 283
Jessika Alvena Munth, Wendi Amsuri Nasution
THE EFFECT OF SERVICE QUALITY AND BRAND IMAGE OF BBM SHELL ON CONSUMER PURCHASING DECISIONS AT GENERAL FUEL FILLING STATIONS (SPBU) 284 – 290
Susilawati Silitonga, Riandani Rezki Prana
THE INFLUENCE OF DIGITAL MARKETING STRATEGIES AND PRODUCT QUALITY ON SALES GROWTH IN SMALL AND MEDIUM-SIZED ENTERPRISES: A CASE STUDY OF MAMAK FROZEN FOODS 285 – 298
Cindi Prasia, Sixson Roberto Simangunsong
THE INFLUENCE OF SOCIAL MEDIA PROMOTION AND CONSUMER REVIEWS ON PURCHASING DECISIONS ON FASHION PRODUCT PURCHASE FOR GEN Z IN MEDAN 299 – 305
Nadya Amanda Br Barus, Sixson Roberto Simangunsong
THE INFLUENCE OF SERVICE QUALITY, PRODUCT QUALITY ON CUSTOMER SATISFACTION AT INDOMARET WAHIDIN 306 – 312
William William, Anggia Arif
THE INFLUENCE OF FINANCIAL LITERACY AND RISK PERCEPTION ON STUDENTS INVESTMENT INTEREST IN MEDAN CITY 313 – 331
Cindi Dwi Kartika, Muliyani

EDUCATION

PENGGUNAAN MODEL VIDEO DALAM PENDIDIKAN AUTISME: KAJIAN SISTEMATIK TENTANG CABARAN DAN IMPLIKASI 332 – 350
Hafizol Abu Hassan, Siti Salmah Mohd Pilus, Mohd Fairuz Rejah

KEBERKESANAN PELAKSANAAN KURSUS PASTRI DAN PEMPROSESAN MAKANAN LEMBAGA KEMAJUAN PERTANIAN MUDA (MADA) DI KOLEJ KOMUNITI BANDAR DARUL AMAN 351 – 359
Noor Ain Mohd Faudzi, Seri Wati Said

LIGHTING MONITORING TRAINER FOR ENERGY PERFORMANCE MEASUREMENT AND VERIFICATION LABORATORY 360 – 367
Amrah Mat Safri, Nurul Malihah Marzuan

CHALLENGES FACED BY SEMESTER 1 STUDENTS IN ANSWERING ESSAY QUESTIONS ON CIRCUIT ANALYSIS TOPICS IN THE DET10103 ELECTRICAL CIRCUIT 1 COURSE 368 – 374
Laila Rosemaizura Yaakop, Hasnina Haji Abd Rahman

PERSEPSI PELAJAR KOLEJ KOMUNITI LEDANG TERHADAP PENGGUNAAN MEDIA SOSIAL SEBAGAI PLATFORM PEMASARAN PERNIAGAAN 375 - 380
Faridah Shariyah Sharuddin, Mohd Hoirie Abdul Manah, Rohayu Roddin

EXPLORING THE MEDIATING EFFECT OF TEACHER ENGAGEMENT IN METAVERSE-ENHANCED TVET EDUCATION 381 – 389
Darren Peter, Azeyan Awee, Peter Tan Sin Howe

INTEGRATING DESIGN THINKING IN FINAL YEAR PROJECTS: PERSPECTIVES OF LECTURERS AND STUDENTS IN MALAYSIAN POLYTECHNICS 390 – 400
Azhani Ariffin, Azman Mazlam, Zarina Syuhaida Shaarani

LEARNING: THE PERCEPTION, ATTITUDE, AND READINESS OF VOCATIONAL COLLEGE STUDENTS IN LEARNING SECRETARIAL SUBJECTS 401 – 407
Alissa Shafiyah Mohd Shamsul Hisham, Azwa Badriyyah Zakaria, Muhammad Hazim Najmi Mohd Haffez, Mohd Nawi Yaacob

DESIGN OF INTERACTIVE 3D ANIMATION AS AN EDUCATIONAL MEDIUM FOR COMPUTER SHORTCUT KEY FUNCTIONS USING THE MULTIMEDIA DEVELOPMENT LIFE CYCLE (MDLC) METHOD 408 – 419
Jonatan Priji Tambunan, Mesran

KEFAHAMAN FIQH HAID DALAM KALANGAN REMAJA DEWASA: KAJIAN KES TERHADAP PELAJAR PEREMPUAN KOLEJ KOMUNITI 420 – 427
Haizam Md Warap, Nurul Nadiah Tukirin, Norhidayah Md Saleh

PANDANGAN PELAJAR TERHADAP KEBOLEHLAKSANAAN DAN KEPERLUAN PROGRAM TAHFIZ AL-QURAN DI POLITEKNIK PORT DICKSON: SATU KAJIAN RINTIS 428 – 438
Nor Hasanah Mohd Yusoff, Umi Syahidah Anuari, Ainun Syakirah Agos Salim, Mimi Aineen Abu Mansor, Suhaimi Samad

DIGITAL MARKETING STRATEGY ON FACEBOOK AND SERVICE QUALITY TOWARDS PRODUCT SALES AT PT INGCO TEKNIKA INDONESIA: CH STORE 439 – 443
Perdi Saputra Silalahi, Cece

TAHAP PENGAMALAN AJARAN ISLAM DALAM KALANGAN PELAJAR POLITEKNIK MERLIMAU MELAKA DARI ASPEK IBADAH 444 – 452
Suriati Barning, Mohd Faizal Mat Pesa

GAMIFYING DATABASE LEARNING: ENHANCING ENGAGEMENT AND MASTERY THROUGH INTERACTIVE PLAY 453 – 457
Sharizan Abdul Jamil, Haryati Mahmod

IMPAK PENDEDAHAN AWAL PERISIAN BIM DAN AUTOCAD TERHADAP KESEDIAAN KERJAYA PELAJAR TVET 458 – 466
Mohd Raduan Amran, Khairul Nizam Mat Amin, Dusuki Ahmed

PERSEPSI PENSYARAH TERHADAP PENGGUBALAN SOALAN PENTAKSIRAN BERTERUSAN: SATU KAJIAN DI KOLEJ KOMUNITI SEBERANG JAYA 467 – 474
Ahmad Ikhwan Zakaria, Mohd Farid Ismail, Mohd Hasrul Hamzah

REKA BENTUK KIT PEMBELAJARAN MODEL IBS SEBAGAI ALAT BANTU MENGAJAR DI INSTITUSI TVET 475 – 481
Nurul Syuhada Safaruddin, Naziah Mohd Isa, Azilawati Harun

TAHAP KOMPETENSI DAN KEMAHIRAN SOFTSKILLS GRADUAN JABATAN PERDAGANGAN POLITEKNIK TUANKU SULTANAH BAHIYAH (PTSB) 482 – 491
Noraihan Mamat Zambi, Rosnida Othman, Nor Fathimah Fathil

SCIENTIFIC ARTICLE WRITING TRAINING AS AN EFFORT TO IMPROVE STUDENTS' PUBLICATION SKILLS AT AKADEMI KEUANGAN PERBANKAN NUSANTARA 492 – 498
Jauharil Maknuni, Masitah, Ismail, Selvi Mai Hetti, Rona Elia

THE INFLUENCE OF PROMOTION AND PRICE ON PURCHASING DECISIONS IN E-COMMERCE SHOPEE THROUGH BRAND IMAGE AS AN INTERVENING VARIABLE 499 – 504
Dimas Anjas Moro, Ngajudin Nughroho

EXPLORING SPORTS PARTICIPATION AND ATTITUDES AMONG UNIVERSITY FOUNDATION STUDENTS: IMPLICATIONS FOR HOLISTIC STUDENT DEVELOPMENT 505 – 511
Zahayu Md Yusof, Muhammad Syahril Bahari, Masnita Misiran, Hasimah Sapiri

KERJAYA SELEPAS BERGRADUAT: KAJIAN PASARAN PEKERJAAN BAGI PEMEGANG DIPLOMA PENGAJIAN VIDEO DAN FILEM POLITEKNIK METRO TASEK GELUGOR 512 – 518
Azizah Siron, Rasma Suzieyantee Ismail, Muhammad Hafizul Omar@Osman

KAJIAN TAHAP KEPUASAN PELAJAR TERHADAP KEMUDAHAN DAN PERKHIDMATAN DI POLITEKNIK TUANKU SULTANAH BAHIYAH (PTSB) 519 – 526
Wan Nor Sariza Wan Husin, Azilawati Harun, Nasreen Rusli

A CDIO-BASED APPROACH TO DEVELOPING A CREATIVE MARKETING PLAN FOR STUDENT INNOVATION PRODUCTS 527 – 531
Damaisari Mohd Nawi

SCIENCE AND MATHEMATICS

HUBUNGAN ANTARA PENYERTAAN BENGKEL PENASIHATAN MATEMATIK DAN MOTIVASI TERHADAP PENCAPAIAN MATEMATIK KEJURUTERAAN 1 532 – 540

DRONES IN LOGISTICS: THE CHALLENGES AND IMPACTS FOR DELIVERING THE FUTURE

Farah Wahida Rabu*

Commerce Department, Seberang Perai Polytechnic, 13500 Permatang Pauh, Penang, Malaysia

*Corresponding author e-mail address: farah_wahida@psp.edu.my

Abstract

The increase in e-commerce activities over time has led to a surge in the number of parcels that need to be sent to users across the country. This phenomenon clearly demonstrates that the logistics sector, particularly in the context of last-mile delivery, plays a crucial role in meeting customer demand. However, the increase in the number of parcels makes the delivery process increasingly challenging, especially in ensuring that customers' goods arrive on time. Furthermore, worsening traffic congestion further complicates deliveries, especially using ground vehicles such as trucks, cars, and motorcycles. In this context, drones emerge as one of the innovative solutions with the potential to overcome challenges in modern logistics. The objective of this study is to identify the challenges of using drones in logistics activities and to examine the impact of their use on the effectiveness of the delivery process. This research employs a mixed-methods approach, integrating secondary data from a literature review with qualitative insights obtained through semi-structured interviews with representatives from Real Sky System Sdn. Bhd. The findings reveal that the primary challenges in drone delivery include battery life, tracking at high speeds, legal limitations, and navigating cities effectively. The impact of using drones in future delivery can be to deliver quicker, improve rural access, increase efficiency, and minimize carbon footprint, while simultaneously decreasing labor costs and supporting rural enterprises. This study provides insights and practical recommendations for implementing the use of delivery drones, particularly in areas with high demand density.
Keywords: E-commerce; Logistics; Last mile.

1. Introduction

The rapid spread of e-commerce has led to a significant increase in the volume of parcel deliveries, especially in urban areas (Borghetti et al, 2022). Furthermore, after the occurrence of the epidemic situation of COVID-19, it caused a sudden increase in e-commerce activities in every sector, such as the food sector, daily goods, clothing, and so on (Fuad et al, 2021). Most buyers also switch to buying goods online because it is easier, efficient, and cheaper than the market price. The sudden growth of e-commerce activities has made the logistics or delivery process a critical matter to ensure that the goods reach the customer according to the time that has been set (Mohammad et al., 2023). The use of trucks, vans, or motorcycles to deliver goods directly to customers nowadays seems less relevant because the increased use of these vehicles contributes to several problems of traffic congestion, environmental pollution, and bad health effects (Boysen et al., 2021). For instance, the number of parcel volumes reached 21.4 billion in 2023 compared to 21.5 billion in 2022. In addition, the average volume of shipped packages every second around the world was 687 parcels, equal to 59.3 million each day. Furthermore, the current volume of parcels worldwide is expected to grow further and reach a figure between 26.1 to 28.3 billion packages by 2028 (Verckens et al, 2024).
Unmanned Aerial Vehicle (UAV), Unmanned Aircraft System (UAS), and Remotely Piloted Aircraft (RPA) are other names for "drone" (Vlahovic N, Knezevic B, Batalic P, 2016). Drone technology helps facilitate the process of delivering goods in urban areas more efficiently and effectively (Nurgaliev et al., 2023). Furthermore, the existence of this drone technology

facilitates logistics activities, especially in the process of delivering goods directly to customers (last-mile delivery). Other than that, drones are not only used for the process of delivering goods to customers, but they are also used for safety and security sectors such as medicine, aerial surveillance, site inspection, and military activities (Ali et al., 2024). From (Jahani et al., 2024), the technology of using drones has developed so well with the addition of advanced instruments, especially in the Logistics and Supply Chain sector. The development of this drone technology indirectly helps to improve the efficiency of the delivery of customer goods to the final destination, as well as guaranteeing the perfection of traffic and the immediate release of vehicles. In line with several Sustainable Development Goals (SDGs) of the United Nations, especially regarding SDG 13 (Climate Change) and SDG 9 (Industry, Innovation, and Infrastructure). This study was conducted to assess the challenges that may be faced in the development of drone technology, including technical, legal, and infrastructure aspects. In addition, this study also examines the impact of using drones in the process of delivering packages directly to customers, including the impact on logistics efficiency, operational costs, as well as the impact on the environment and society.

The literature review aims to provide a comprehensive overview of the existing research and theoretical foundations relevant to this study. By examining these areas, the research contextualizes the current state of knowledge, identifies gaps, and justifies the need for this research. The Sustainable Development Goals (SDGs), established by the United Nations in 2015, call for global action to end poverty, protect the planet, and ensure peace and prosperity by 2030. Sustainable Development Goal SDG13, which emphasizes action on climate change, is closely related to this study. The use of drones in last-mile delivery has the potential to reduce carbon emissions, thereby helping to reduce greenhouse gas emissions and supporting global efforts towards environmental sustainability(Bányai, 2022). In addition, this study is also closely related to Sustainable Development Goal SDG 9, which includes aspects of industry, innovation, and infrastructure. The study findings show that the use of drones in logistics implementation not only improves the efficiency of last-mile delivery but also increases access to services in previously difficult-to-reach rural areas (Kumbhani & Kant, 2024).

The SDGs address interconnected challenges across economic, social, and environmental dimensions. Studies show that businesses are increasingly reporting on their progress towards these goals, driven by institutional factors and organizational characteristics (Subramaniam et al., 2023). The SDGs also necessitate the engagement of various stakeholders, including businesses, cities, and civil society, to achieve sustainable development (Kota et al., 2021). However, while the SDGs have influenced policies and institutions, their impact on resource allocation and legislative action remains limited (Biermann et al., 2022). In higher education, the SDGs have prompted initiatives to promote sustainability (Serafini et al., 2022). Integrating the SDGs with energy efficiency analysis shows positive associations with sustainable economic and financial development (Zakari et al., 2022).

The concept of a green environment involves minimizing environmental impact through sustainable practices such as reducing carbon footprints, conserving resources, and promoting biodiversity. The logistics industry is notorious for its impact on the environment. This section explores the literature on drone technology in the logistics sector, focusing on the role of drone technology in fostering the sustainability of the sector. The increase in e-commerce has led to a rise in the number of packages, which in turn increases the demand for land transport to ensure that the delivery process can be carried out efficiently. This can directly increase vehicle smoke emissions, which contribute to environmental pollution. By changing the use of ground vehicles to drone technology to perform long-distance delivery, this helps reduce the process of CO_2 emissions (Rashidzadeh et al., 2021). Directly, it can also reduce air pollution. According to Borghetti et al. (2022), it states that drones can deliver goods to customers quickly because drones are not involved in traffic jams, and they are also

environmentally friendly because they use electronic motors. The use of drones for the delivery process is better than the use of traditional methods, as it is able to bypass challenges related to accessibility, especially related to traffic congestion, safety, and environmental pollution (She et al., 2020). In addition, drones have a very low impact on Greenhouse Gas (GHG) emissions and pollutant emissions (Moadab et al., 2022).

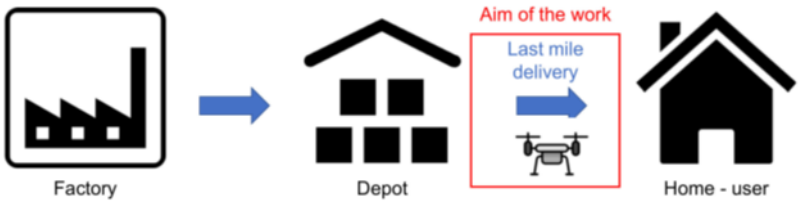

Fig. 1. Aim of the drone work

Last-mile delivery (LMD) was the final leg of the delivery process, where goods are transported from a transportation hub to the end consumer. It has garnered significant attention in academic and industry circles (Sorooshian et al., 2022). This critical stage significantly influences customer satisfaction, operational costs, and urban logistics. The increase in e-commerce sectors causes an increase in demand for LMD, this is because customers choose to make online purchases that are more flexible and easier. (Nils et al. 2020). The term "last-mile delivery" originated in the telecommunications industry and refers to the final stage of a delivery process. In other words, "last-mile logistics," "delivery," "distribution," and "transport" are employed in literature, depending on the context and scope (Jazairy et al., 2024). According to the Olsson et al., 2019, it states that LMD is an activity where physical goods are sent to the end customer according to the place that has been set. Last-mile delivery aims to deliver goods from a transportation hub to final customers(Olsson et al., 2019).

Overall, as explained by Noppakun (2018), the last-mile delivery can be divided into five main categories: receiving box, collection point, post office, attended home delivery, and unattended home delivery. This classification reflects the various approaches available to ensure goods reach consumers in the most efficient way and suit their needs.

Fig. 2. Last-mile deliveries concept

A drone is a flight vehicle that uses a battery to propel itself, and it does not require a pilot. Most of the logistics industry has taken the opportunity to use drone technology for the process of delivering goods to end customers, also known as last-mile delivery. But there are some challenges for drone technology to adapt to the logistics industry. According to Cıkmak et al. (2023), the challenges that need to be faced to apply drones in the logistics industry are terrorist attacks, lack of legal regulations, and the difficulty of the flight permit process, flight area limitations due to limited visual line of sight (VLOS), and personal data protection. The main challenges are limited flight time, the robustness of the signal, post-data analysis, multi-drone collaboration, weather conditions, and distractions to the traffic caused by drones (Fan & Saadeghvaziri, n.d.). According to Francesco et al,.2024, the findings of their research are

that drone-based delivery systems have hurdles in various sub-domains, including key issues with Beyond Visual Line of Sight (BVLoS) operations. Furthermore, the implementation of drones in the delivery process not only presents technical challenges but also involves issues in the legal system, infrastructure requirements, and implementation costs(Aggarwal et al., 2023).

Although the use of drones presents new challenges in the logistics sector, especially in the technical development section. It helps with various problems that can be solved with drone technology. Among them, from the study Koiwanit, 2018drone delivery is the most environmentally beneficial mode of transportation for online purchasing in various scenarios, according to observed results. For example, drone technology helps to reduce global warming, water acidification, and ozone layer depletion. Next, the study found that drone delivery has a lower global warming potential (GWP) per 1 km compared to motorbike delivery, and produces half the particles (Park et al., 2018). According to Meng et al., 2023, drone-assisted delivery decreased carbon emissions by 24.90%, total costs by 22.13%, and delivery time by 20.65% compared to traditional vehicle delivery. Drone delivery helps to improve efficiency, reduce transportation costs, and minimize environmental impact (Drone Delivery: Benefits, Use Cases, & Retailer Examples, n.d.).

The integration of drone delivery systems holds immense potential to revolutionize logistics and transportation, offering unprecedented speed, efficiency, and accessibility. However, significant challenges remain, including privacy concerns and the technical limitations of current drone technology. Addressing these issues requires a collaborative approach among governments, private sector innovators, and communities to establish clear frameworks, advance technology, and foster public trust.

2. Methodology

For this study, a mixed-method approach was employed, encompassing both secondary research and a semi-structured interview with an industry expert, a representative from SkyRealm Sdn Bhd. SkyRealms Sdn Bhd was selected as the case study organization because it met the study's objectives, which focused on the use of drones in logistics, especially last-mile delivery. The company is developing an on-demand drone delivery service, Sky Drop, which will be launched in 2027 and is expected to be a pioneer in Southeast Asia (*Invest in SkyDrop | PitchIN*, n.d.). The secondary method involved an extensive review of existing literature, reports, and publications related to drone technology in the context of last-mile deliveries, specifically in Malaysia. This method allowed for the gathering of foundational knowledge and insights into challenges and impact associated with drone delivery. The interview aimed to obtain first-hand perspectives and insights from a practitioner directly involved in or impacted by drone technology in the logistics area. The interview questions were designed to cover various aspects, including current opportunities for implementing drone technology in logistics industries, challenges and barriers faced, feasibility and implementation strategies, policy considerations, and future outlook. By combining secondary research with semi-structured interviews with industry experts, this mixed-method approach provided a comprehensive analysis of the concept of drone delivery in the logistics sector. The interview questions were developed by adapting from a previous study on drones as a service for last-mile delivery, which provided evidence of economic viability and demonstrated how semi-structured interviews were conducted to achieve their research objectives (Filiopoulou et al., 2025).

3. Results and Discussion

Table 2. Interview response

Section 1: General Background	
1. Can you please provide a brief overview of your role and responsibilities at Sky Real System Sdn Bhd?	My role at SkyRealm Sdn Bhd is as a Software Engineer, which responsible most of the software and hardware parts
2. How long have you been involved in the autonomous industries?	4 years
Section 2: Opportunities for Drone Delivery Implementation	
3. In your opinion, what are the key opportunities for adopting Drone Delivery in the logistics industry?	It provides faster delivery as it can reduce time taken to deliver the goods by skipping the long route and traffic and most important is it also provide better accessibility to rural area where sometime ground delivery is not very practical
4. How could drone delivery contribute to improving operational efficiency and sustainability in the logistics industry?	It could reduce time thus improve the efficiency, and reduce carbon footprint as it can be use with renewal energy to support for green initiative
5. What potential economic benefits do you foresee from the implementation of drone delivery in logistics industries?	Reduce labour cost by reducing human courier, open possible business opportunities for rural area
Section 3: Challenges and Barriers	
6. What are the primary challenges that you face in developing drone technology in the logistics industry?	Continue operation with battery life concern, precise object tracking at high-speed delivery
7. Are there specific regulatory or policy-related barriers that impact the implementation of drone technology in logistics industries?	Usage of cellular (4G/5G) communication is prohibited in UAV industry, thus may impact big scale multi-drone operation, cybersecurity attack
8. What technical or logistical challenges do you anticipate with integrating drone delivery in last-mile deliveries?	Limited battery capacity for long range delivery, fully autonomous navigation may require very mature and precise system especially in urban area
Section 4: Feasibility and Implementation Strategies	
9. What factors would most influence your decision to implement drone delivery in logistics industries?	Possible growth of more business in urban and rural drone delivers, thus generating viable future revenue
10. How do you think these challenges can be overcome?	Work closely with well-known food delivery service and encourage public to use drone delivery service
11. Are there any case studies or examples of other countries successfully implementing drone delivery that you find particularly compelling or informative?	Yes, example is Wing Aviation, they successfully complete around 300,000 deliveries of foods and other goods.
Section 5: Policy and Stakeholder Engagement	
12. What role do you believe government policies and incentives play in facilitating the adoption of drone delivery in logistics industries?	Financial support and trial testing
13. How important is stakeholder engagement, including with local communities and industry	Stakeholder engagement is essential for

partners, in the process of implementing drone delivery in logistics industries?	regulatory approval, public acceptance, and seamless industry integration, ensuring efficient and sustainable drone delivery implementation.
Section 6: Impact used drone technology in logistics	
14. How does drone delivery reduce the carbon footprint compared to traditional delivery vehicles?	Eliminate CO2 emission by using fully electric motor, increase efficiency by taking shortest distance for deliveries.
15. What operational challenges have logistics companies faced when implementing drone technology for deliveries?	Flight range and public safety
16. What regulatory hurdles must be overcome for drones to become widely adopted in logistics, especially for last-mile deliveries?	Reliable navigation and obstacle avoidance
Section 7: Future Outlook	
17. Where do you see the future of drone delivery being adapted in last-mile deliveries?	Drone delivery will enhance last-mile logistics in urban, rural, and emergency scenarios by enabling faster, contactless, and cost-effective deliveries. Challenges like regulations and battery life remain, but advancements will drive wider adoption.

A SkyRealm Sdn Bhd software engineer with four years of experience in the autonomous sector emphasized the potential of drone delivery for improved rural access, faster service, more efficiency, and a lower carbon footprint, as well as for reducing labour expenses and supporting rural enterprises. Battery life, high-speed tracking, legal limitations, and urban navigation are among the difficulties. Potential for growth in both urban and rural areas, cooperation with delivery services, and successful case studies like Wing Aviation are all necessary for feasibility. Stakeholder involvement and government backing are essential for public acceptance and regulatory approval. With electric motors, drone delivery lowers carbon emissions, yet there are issues with public safety and flight range. With the required improvements in rules and battery technology, the future of emergencies, urban, and rural delivery appears bright. To support the data obtained through interviews, this study also used secondary research methods. Previous studies have shown that the use of drones in final delivery has successfully reduced the amount of CO2 emissions by 24.90% (Meng et al., 2023). Research findings from (Borghetti et al., 2022) shows that last-mile delivery using drones not only reduces the impact on the environment but also increases the profits of transportation providers. Furthermore, there are several limitations to the use of drones for the final delivery process, including high cost, legality, and battery consumption (Balassa et al., 2023).

4. Conclusion

The study concludes that drone delivery has revolutionary potential for the logistics industry by improving sustainability, operational efficiency, and delivery accessibility. Despite current limitations, improvements in battery life, autonomous navigation, and supporting legislation are projected to encourage increased usage. To solve technological and operational challenges, effective implementation will need aggressive government initiatives, industry partnerships, and stakeholder participation. Strategic alliances with established distribution networks, as well as public education programs, will help to create confidence and accelerate acceptance. As technology advances, drone delivery is set to become an essential component of modern last-mile logistics on a worldwide scale.

KEBERKESANAN PENGGUNAAN *THERMOCUBE* DALAM UJIAN BIOLOGIKAL DI KLINIK PERGIGIAN

Mohd Zaniel Mahadzi*, Azahar Mohd Noor, Syaiful Nizam Ab Rahim

Department of Mechanical Engineering, Politeknik Sultan Abdul Halim Mu'adzam Shah, 06000 Jitra, Kedah, Malaysia

*Alamat e-mel penulis: mohdzaniel3779@gmail.com

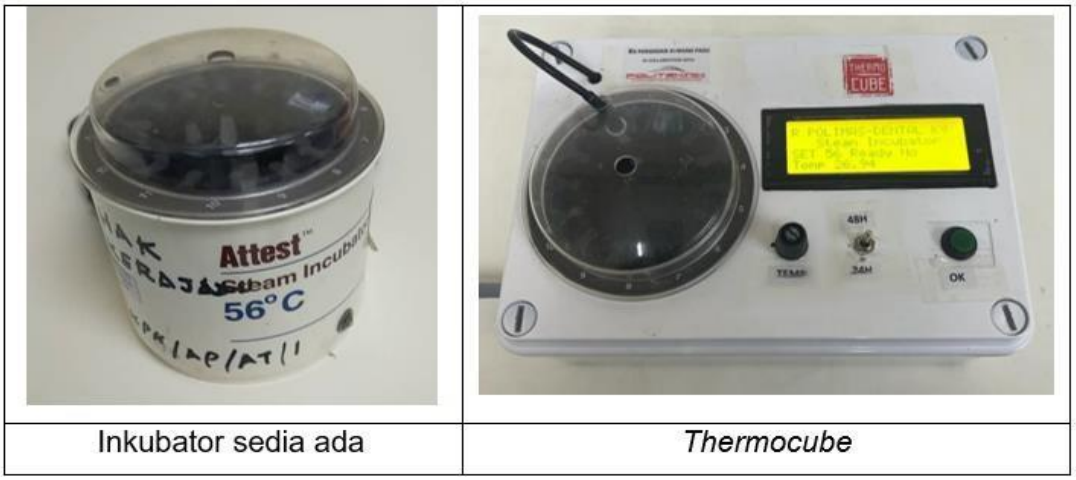
Abstrak

Kajian ini dijalankan bagi menilai tahap keberkesanan penggunaan projek inovasi '*thermocube*' berbanding inkubator konvensional yang digunakan sebelum ini di klinik pergigian sekitar daerah Kubang Pasu, Jitra. Seramai 20 orang kakitangan daripada empat klinik pergigian telah dipilih sebagai responden. Reka bentuk kajian adalah berbentuk kajian kes, dengan data diperoleh melalui borang soal selidik berskala Likert yang diedarkan selepas dua tahun penggunaan '*thermocube*' di lapangan. Analisis data dilakukan menggunakan perisian Microsoft Excel. Soal selidik merangkumi aspek-aspek berikut: ketepatan suhu inkubasi semasa operasi, masa yang diperlukan untuk mencapai suhu optimum, tahap kepuasan pengguna, dan bebanan kerja kakitangan. Dapatan menunjukkan bahawa responden secara keseluruhannya memberikan maklum balas yang sangat positif terhadap penggunaan '*thermocube*'. Nilai min yang diperoleh bagi '*thermocube*' adalah antara 3.75 hingga 4.00, manakala inkubator konvensional hanya mencatatkan nilai min antara 1.20 hingga 1.70 sahaja. Kesimpulannya, penggunaan '*thermocube*' terbukti lebih berkesan dari segi teknikal dan operasional, dengan peningkatan ketepatan suhu inkubasi, kecekapan proses pensterilan, penjimatan kos, serta peningkatan tahap kepuasan dan produktiviti kakitangan klinik pergigian.
Kata kunci: Thermocube; Pergigian; Inkubator.

1. Pengenalan

'*Thermocube*' merupakan sebuah peranti inovatif yang dibangunkan khusus untuk menentusahkan keberkesanan proses pensterilan peralatan pergigian menggunakan autoklaf melalui ujian biologikal. Ujian biologikal ini penting dalam menentukan sama ada mikroorganisma telah dinyahaktif sepenuhnya melalui proses autoklaf yang dijalankan.
Dalam amalan sedia ada, inkubator konvensional digunakan untuk pengeraman sampel ujian biologikal dan perlu dipanaskan sekurang-kurangnya selama 25 minit sehingga mencapai suhu operasi $56 \pm 2°C$ sebelum ujian dapat dijalankan. Walau bagaimanapun, beberapa kelemahan ketara telah dikenal pasti terhadap inkubator sedia ada, termasuk ketiadaan paparan digital bagi suhu dan masa, serta ketiadaan termometer bersepadu untuk mengukur suhu dengan tepat semasa pengeraman dijalankan (Faizal Amin Nur Yunus et al., 2018). Ketidakupayaan untuk menyelaras suhu mengikut piawaian pengeluar turut menimbulkan risiko terhadap ketepatan keputusan ujian.

Isu ini turut ditegaskan melalui teguran audit pematuhan piawaian ISO, yang telah mendorong kepada pembangunan satu penyelesaian inovatif dikenali sebagai '*thermocube*'. Rekabentuk '*thermocube*' dirangka bagi menangani keseluruhan kekangan yang wujud pada inkubator konvensional. Peranti ini bukan sahaja menyediakan pemantauan suhu dan masa secara waktu nyata (real-time), malah turut membolehkan pengguna menyelaras suhu pengeraman dengan lebih tepat dan konsisten mengikut spesifikasi yang ditetapkan oleh pengeluar kit ujian biologikal. Penggunaan '*thermocube*' telah diuji dan dilaksanakan di beberapa klinik pergigian sekitar daerah Kubang Pasu, Jitra, Kedah, dengan tujuan untuk menambah baik kecekapan teknikal dan keselamatan dalam proses kawalan mutu pensterilan peralatan pergigian.



Inkubator sedia ada | *Thermocube*

Rajah 1. Inkubator dan *Thermocube*

'*Thermocube*' merupakan projek inovasi yang direka bentuk untuk menambah baik fungsi inkubator sedia ada agar lebih efisien dan sesuai digunakan dalam persekitaran klinik pergigian. Inovasi ini melibatkan penambahan beberapa ciri baharu yang tidak terdapat pada inkubator konvensional, termasuk paparan digital suhu pengeraman bagi pemantauan yang lebih tepat, sistem pelarasan suhu yang membolehkan kawalan suhu yang lebih fleksibel, serta sistem auto-off berdasarkan tempoh operasi bagi meningkatkan keselamatan dan penjimatan tenaga (Mihai Tudor et al., 2018). Penambahbaikan ini bukan sahaja meningkatkan kecekapan teknikal peranti, malah mengurangkan risiko ralat operasi. '*thermocube*' telah digunakan secara praktikal di beberapa klinik pergigian sekitar daerah Kubang Pasu, Jitra, Kedah, dan perbandingan visual antara inkubator konvensional dengan '*thermocube*' ditunjukkan dalam Rajah 1.

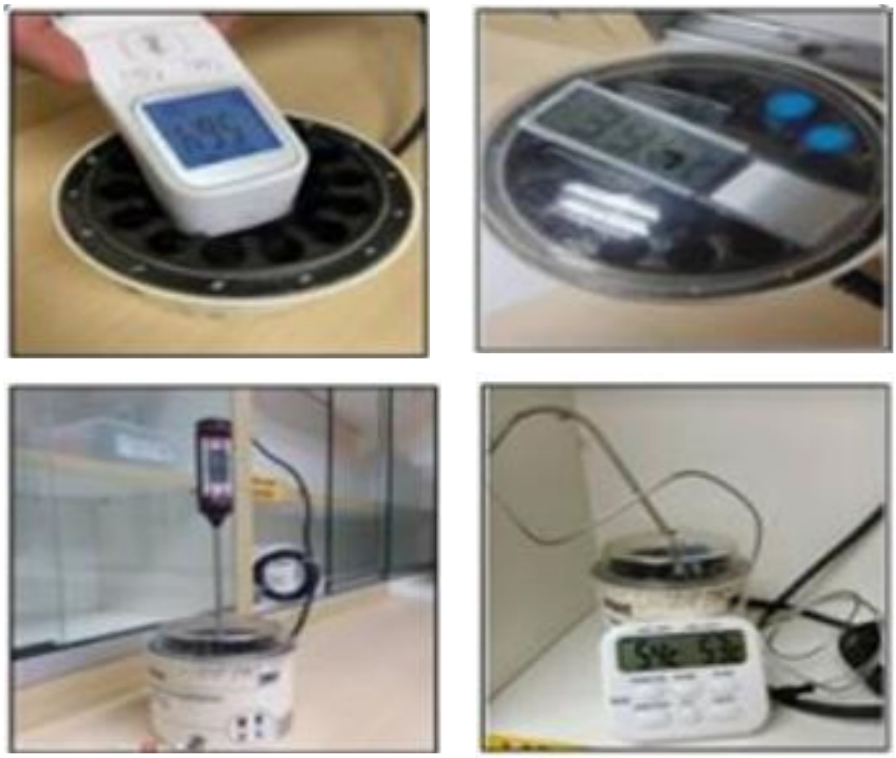
Antara permasalahan utama yang dikenal pasti oleh para responden semasa menggunakan inkubator konvensional ialah keperluan untuk memegang termometer secara manual bagi mengukur suhu inkubasi. Kaedah ini bukan sahaja menyukarkan pengguna, malah meningkatkan risiko ralat manusia (human error) yang boleh menyebabkan bacaan suhu menjadi tidak tepat. Tambahan pula, inkubator sedia ada tidak dilengkapi dengan sistem pelarasan suhu yang membolehkan suhu diselaraskan secara tepat mengikut piawaian yang ditetapkan. Keadaan ini menyebabkan masa yang diambil untuk mencapai suhu optimum menjadi lebih lama dan memerlukan pemantauan berterusan oleh kakitangan, sekali gus meningkatkan beban kerja serta mengurangkan kecekapan operasi klinikal.
Kajian ini diakukan untuk:

- Menilai keberkesanan penggunaan '*thermocube*' dalam ujian biologikal di klinik pergigian.
- Menganalisis persepsi staf klinik terhadap aspek teknikal dan kaedah operasi '*Thermocube*'.

2. Metodologi

Rajah 2 menunjukkan beberapa pendekatan yang telah diterapkan bagi mengatasi kekangan teknikal yang wujud sebelum penghasilan inovasi '*thermocube*'. Sebelum ini, jururawat atau pengendali di klinik pergigian terpaksa memegang termometer secara manual untuk mengukur suhu inkubator. Kaedah ini bukan sahaja terdedah kepada risiko ralat manusia (*human error*), tetapi juga menyebabkan bacaan suhu menjadi tidak konsisten dan tidak tepat. Selain itu, terdapat situasi di mana pengendali tidak menjalankan pengukuran suhu sebelum penggunaan, dan tidak mengetahui suhu sebenar serta tempoh pemanasan inkubator

semasa ujian biologikal dijalankan, yang boleh menjejaskan keberkesanan proses pensterilan.



Rajah 2. Kaedah manual yang diguna pakai

Sebagai respons terhadap isu ini, '*thermocube*' telah direka bentuk dengan sistem pemantauan dan kawalan suhu yang lebih maju dan automatik. Dapatan kajian ini disokong oleh kajian Alimuddin Alimuddin et al. (2021), yang menunjukkan bahawa integrasi sistem kawalan suhu secara automatik menggunakan pengawal mikro (microcontroller) membolehkan kawalan suhu yang konsisten dan stabil sepanjang tempoh inkubasi. Dalam ujikaji tersebut, bacaan suhu semasa, suhu minimum dan maksimum, serta tempoh operasi dipaparkan secara langsung melalui skrin, dan sistem turut dilengkapi dengan penggera yang akan berbunyi apabila suhu sasaran dicapai atau apabila tempoh inkubasi tamat.

'*Thermocube*' turut menyokong pelarasan suhu dalam julat 50°C hingga 60°C kerana julat ini sesuai untuk menguji keberkesanan proses nyahkuman atau pensterilan**.** Pengguna boleh memilih suhu inkubasi mengikut spesifikasi yang ditetapkan oleh pengeluar *biological indicator*. Tambahan lagi, sistem *auto-off* selama 24 jam dan 48 jam turut dibangunkan sebagai ciri keselamatan dan kemudahan. Fungsi ini amat berguna khususnya apabila klinik mengalami kekangan seperti kekurangan autoklaf atau semasa tempoh cuti panjang, kerana ujian boleh dijalankan secara automatik tanpa pengawasan langsung.

Rajah 3. *Thermocube*

Sistem 'thermocube' direka dengan tiga mod operasi utama, iaitu Mode Setting, Mode Default, dan Mode Run, yang dikendalikan secara berurutan bergantung kepada tetapan awal sebelum dan selepas sistem dihidupkan. Proses kerja bagi ujian biologikal menggunakan 'thermocube' adalah dengan menggunakan dua tiub sampel kuman dimana satu tiub disterilkan bersama peralatan pergigian menggunakan mesin autoklaf dan satu tiub tidak disterilkan sebagai kawalan. Kedua-dua tiub kuman kemudiannya dimasukkan ke dalam 'thermocube' untuk proses inkubasi selama 24 jam atau 48 jam pada suhu 56°C. Hasil dapatan diklasifikasikan berjaya jika tiub kuman yang telah disterilkan menunjukkan tiada perubahan warna (kekal terang) dan tiub kuman yang tidak disterilkan menunjukkan perubahan warna (menjadi gelap).

3. Dapatan dan Perbincangan

Kajian ini bertujuan untuk menilai tahap keberkesanan '*thermocube*' berbanding inkubator sedia ada dalam ujian biologikal di klinik pergigian sekitar daerah kubang pasu. Dapatan data diperolehi melalui kaedah edaran borang soal selidik yang diedarkan selepas tempoh 2 tahun '*thermocube*' digunapakai oleh para kakitangan klinik pergigian dalam ujian biological di klinik pergigian. . Kandungan borang soal selidik terdapat daripada 10 item sahaja seperti yang terdapat pada Jadual 1 dan Jadual 2. Responden adalah terdiri daripada para kakitangan klinik pergigian daerah kubang pasu seramai 20 orang yang terlibat dalam ujian biologikal di klinik pergigian. Menurut Mohd Najib (1999), soal selidik selalu digunakan sebagai instrumen kajian untuk mengukur konsep yang berkaitan dengan sikap, persepsi dan pandangan seseorang dengan menggunakan soalan bebas jawab (terbuka), senarai semak atau skala kadar . Kaedah soal selidik digunakan kerana dapat menjimatkan masa dan tenaga penyelidik. Proses pengumpulan data dilakukan dengan cepat kerana tidak melibatkan perbelanjaan yang besar, memudahkan kerja menganalisis data, lebih sesuai dan memudahkan responden membuat pemilihan jawapan.

Soal selidik yang digunakan dalam kajian ini dibahagikan kepada tiga bahagian, dan ia diedarkan setelah 2 tahun 'Thermocube' ini digunapakai di klinik pergigian Daerah Kubang Pasu. Bahagian pertama soal selidik merangkumi maklumat Am Responden yang menggunakan 'Thermocube'. Bahagian kedua mengandungi item penilaian yang terbagi kepada tiga bahagian utama iaitu bahagian A: ketepatan suhu inkubasi, bahagian B: masa untuk mencapai suhu optimum dan bahagian C: kepuasan dan beban kerja staf. Skala Likert dengan pilihan 1 hingga 4 digunakan untuk mengukur maklum balas para responden terhadap setiap soalan item yang dikemukakan.

Skala ini terdiri daripada:

1 = Sangat Tidak Setuju
2 = Tidak Setuju
3 = Setuju
4 = Sangat Setuju

Data yang diperoleh daripada borang soal selidik akan diproses menggunakan perisian Microsoft Excel. Untuk tujuan analisis dan interpretasi data, kajian ini menggunakan kaedah statistik deskriptif, dengan penekanan pada nilai skor min**.** Data di analisis dengan menggunakan perisian Microsoft Excel melibatkan 20 orang kakitangan klinik pergigian sekitar daerah kubang pasu yang pernah menggunakan inkubator sedia ada dan projek inovasi '*thermocube*'.

Jadual 1. Dapatan data responden menggunakan inkubator

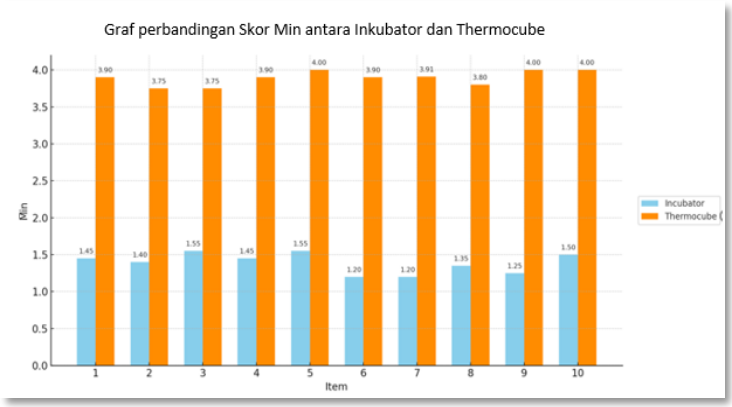
ITEM	Sangat Tidak Setuju		Tidak Setuju		Setuju		Sangat Setuju		Min
1. Inkubator mencapai suhu inkubasi yang tepat seperti yang ditetapkan.	9	45	11	55	0	0	0	0	1.55
2. Suhu inkubasi kekal stabil sepanjang tempoh ujian.	8	40	12	60	0	0	0	0	1.60
3. Hasil ujian biologikal boleh dipercayai.	8	40	12	60	0	0	0	0	1.60
4. Inkubator mengambil masa yang singkat untuk mencapai suhu optimum.	11	55	9	45	0	0	0	0	1.45
5. Masa pemanasan inkubator adalah lebih baik berbanding '*thermocube*'.	6	30	14	70	0	0	0	0	1.70
6. Kecekapan masa inkubator sedia ada dapat meningkatkan kelancaran operasi ujian biologikal.	15	75	5	25	0	0	0	0	1.25
7. Saya berpuas hati dengan penggunaan inkubator sedia ada.	16	80	4	20	0	0	0	0	1.20
8. Inkubator sedia ada mudah untuk dikendalikan.	14	70	6	30	0	0	0	0	1.30
9. Inkubator dapat membantu mengurangkan beban kerja harian saya.	15	75	5	25	0	0	0	0	1.25
10.saya mengesorkan penggunaan inkubator sedia ada kepada klinik pergigian yang lain.	10	50	10	50	0	0	0	0	1.50
							Min Keseluruhan		1.45

Jadual 1 memaparkan kadar peratusan responden yang memberi maklumbalas terhadap penggunaan Inkubator sedia ada Berdasarkan analisis terhadap skor min bagi 10 item penilaian, inkubator sedia ada mencatatkan min keseluruhan sebanyak 1.45, yang diklasifikasikan sebagai rendah dalam skala Likert empat mata. Skor min setiap item berada dalam julat 1.20 hingga 1.70, menunjukkan bahawa majoriti responden memberikan maklum balas negatif atau sangat tidak bersetuju terhadap prestasi peralatan ini. Aspek-aspek yang dikenal pasti mempunyai kelemahan termasuk lah ketidaktepatan dan ketidakstabilan suhu inkubasi, tempoh pemanasan yang tidak efisien, kesan penggunaan yang tidak menyumbang kepada pengurangan beban kerja atau kelancaran operasi dan tahap kepuasan pengguna yang rendah secara keseluruhan. Dapatan ini mencerminkan keperluan untuk penambahbaikan atau penggantian peralatan bagi meningkatkan keberkesanan proses ujian biologi di makmal atau fasiliti berkaitan.

Jadual 2. Dapatan data responden menggunakan *Thermocube*

ITEM	Sangat Tidak Setuju		Tidak Setuju		Setuju		Sangat Setuju		Min
1. '*Thermocube*' mencapai suhu inkubasi yang tepat seperti yang ditetapkan.	0	0	0	0	2	10	18	90	3.90
2.Suhu inkubasi kekal stabil sepanjang tempoh ujian.	0	0	0	0	5	25	15	75	3.75
3.Hasil ujian biologikal boleh dipercayai.	0	0	0	0	5	25	15	75	3.75
4. '*Thermocube*' mengambil masa yang singkat untuk mencapai suhu optimum.	0	0	0	0	2	10	18	90	3.9
5. Masa pemanasan '*thermocube*' adalah lebih baik berbanding sebelumnya.	0	0	0	0	0	0	20	100	4.00
6.Kecekapan masa '*thermocube*' ini dapat meningkatkan kelancaran operasi ujian biologikal.	0	0	0	0	2	10	18	90	3.90
7.Saya berpuas hati dengan penggunaan '*thermocube*' sedia ada.	0	0	0	0	2	10	18	90	3.90
8. '*Thermocube*' mudah untuk dikendalikan.	0	0	0	0	4	20	16	80	3.80
9. '*Thermocube*' dapat membantu mengurangkan beban kerja harian saya.	0	0	0	0	0	0	20	100	4.00
10.saya mengesorkan penggunaan '*thermocube*' kepada klinik pergigian yang lain.	0	0	0	0	0	0	20	100	4.00
					Min Keseluruhan				3.89

Jadual 2 memaparkan kadar peratusan responden yang memberi maklumbalas terhadap penggunaan '*Thermocube*'. Dapatan data jelas menunjukkan prestasi yang sangat baik dengan min keseluruhan sebanyak 3.89, hampir mencapai skor maksimum. Skor min bagi semua item berada dalam lingkungan 3.75 hingga 4.00, yang mencerminkan tahap kepuasan yang sangat tinggi dalam kalangan responden. Antara elemen yang menerima skor tertinggi termasuklah kecekapan masa pemanasan dan kestabilan suhu, Kebolehpercayaan hasil ujian biologi, pengurangan beban kerja harian, tahap kebolehgunaan dan kemudahan pengendalian dan syorkan penggunaan '*Thermocube*' kepada fasiliti lain.Penilaian ini menunjukkan bahawa '*Thermocube*' memenuhi keperluan dan kehendak pengguna sedia ada dalam melaksanakan ujian biological di mana ia dapat untuk beroperasi di makmal secara lebih efisien dan efektif



Rajah 4. Graf perbandingan penggunaan inkubator dan *Thermocube*

Berikut ialah graf perbandingan skor min antara Inkubator *sedia ada* dan '*Thermocube*' berdasarkan 10 item penilaian.Hasil pemerhatian mendapati skor min bagi '*Thermocube*' secara konsisten lebih tinggi berbanding inkubator dan penilaian yang lebih positif terhadap '*Thermocube*' dalam semua aspek., '*Thermocube*' mencapai skor maksimum (4.00) dalam beberapa item, termasuk masa pemanasan, pengurangan beban kerja, dan kesediaan untuk disyorkan serta menunjukkan keberkesanan dan penerimaan yang lebih tinggi terhadap '*Thermocube*' berbanding Inkubator sedia ada.

4. Kesimpulan

Keputusan kajian menunjukkan bahawa '*Thermocube*' adalah alat yang berkesan dalam ujian biologikal di klinik pergigian. Ketepatan suhu inkubasi dan masa pemanasan yang singkat memastikan keputusan ujian yang tepat dan cepat. Kepuasan tinggi dalam kalangan staf menunjukkan bahawa '*Thermocube*' mudah digunakan dan membantu dalam pengurusan beban kerja. Penggunaan '*Thermocube*' dalam ujian biologikal di klinik pergigian terbukti berkesan dari segi teknikal dan pengoperasian. Ia meningkatkan ketepatan dan kecekapan proses pensterilan dan meningkatkan kepuasan serta produktiviti staf.

Abstract

Efficient thermal management is critical for optimizing diesel engine performance, as excessive heat loss reduces energy efficiency and accelerates component degradation. This study investigates the thermal and mechanical behaviour of piston crowns, made of cast iron and coated with various thermal barrier coatings (TBCs) under high-temperature conditions. Finite Element Analysis (FEA) is utilized to model the thermal behaviour of piston crowns coated with Yttria-Stabilized Zirconia (YSZ), Aluminium Oxide–Titanium Dioxide (Al_2O_3+TiO_2), and Aluminium Oxide (Al_2O_3). The study aims to determine which coatings can endure extreme thermal conditions while minimizing induced thermal stresses. The simulation results show that the reduction of temperature difference between uncoated and coated are YSZ = 36.8%; Al_2O_3 + TiO_2 = 34.8% and Al_2O_3 = 36.2%. Therefore, YSZ has the highest reduction and exhibits the most favourable performance, attributed to its low thermal conductivity and excellent resistance to thermal shock. These findings highlight the importance of appropriate TBC selection in improving diesel engine efficiency, reliability, and long-term durability under severe operating conditions.
Keywords: Coating; Thermal barrier coatings (TBC); Piston.

1. Introduction

The global automotive and industrial sectors increasingly demand greater efficiency, lower emissions, and extended engine lifespans. Diesel engines, known for their durability and high thermal efficiency, nonetheless experience substantial thermal energy losses due to excessive heat dissipation. A large portion of this energy escapes through critical components such as the piston, which is subjected to extreme thermal and mechanical loads. These losses not only reduce overall efficiency but also accelerate component wear and shorten service life.

Thermal barrier coatings (TBCs) have emerged as promising solutions to mitigate heat-related challenges in engine components. By minimizing heat transfer, TBCs enhance combustion efficiency and improve resistance to wear and corrosion. Recent research has focused on the thermal performance and protective characteristics of materials such as Yttria-Stabilized Zirconia (YSZ), Aluminium Oxide (Al_2O_3), and Aluminium Oxide–Titanium Dioxide composites (Al_2O_3+TiO_2) in diesel engine environments.

Thermal barrier coatings (TBCs) play a critical role in enhancing the thermal efficiency and mechanical durability of internal combustion engine pistons. Sharma et al. (2024) demonstrated through finite element analysis (FEA) that functionally graded TBCs significantly reduce thermal stress, promote uniform temperature distribution, and improve piston longevity. Similarly, Hariram et al. (2022) applied FEA to evaluate different TBC materials on engine components, confirming reduced piston head temperatures and improved thermal

efficiency. Their study also emphasized that optimal coating thickness plays a vital role in ensuring maximum effectiveness without compromising structural integrity.

Dahal et al. (2023) explored the thermal behavior of diesel engine pistons, reinforcing the importance of thermal protection to minimize stress concentrations under high temperatures. Algin and Raj (2017) further supported this by comparing coated and uncoated pistons, concluding that TBCs enhance durability and reduce heat transfer significantly. Haddad (2023) focused on how varying TBC thickness affects thermal stress distribution, highlighting the delicate balance between insulation effectiveness and potential for coating delamination due to improper bonding.

In related research, Ahmaniemi et al. (2004) performed a thermophysical characterization of modified thick TBCs, revealing enhanced phase stability and lower thermal conductivity—both critical factors for improving engine component performance. Wang et al. (2018) examined the phase stability and thermophysical properties of ZrO_2-CeO_2-TiO_2 ceramics, emphasizing their potential in providing advanced insulation with higher phase resistance, making them ideal candidates for TBC applications.

Radhakrishnan and Park (2021) applied coupled CFD and FEM to analyze gas turbine combustor liners, finding that advanced TBCs significantly improve creep life prediction and overall thermal performance. Though not piston-specific, their simulation approach is applicable to similar thermal-stressed components. Krishna et al. (2023) investigated different piston head profiles using FEM, revealing that geometry also influences thermal distribution and that TBCs enhance performance further when matched with optimized design.

Sirigiri and Esanakula (2022) used automated CAD modeling and FEM analysis for piston design, showcasing how computational tools facilitate efficient TBC evaluation. Meanwhile, El-Mahallawi et al. (2014) studied composite piston materials reinforced with Al_2O_3 and TiO_2 nanoparticles, showing improved hardness and wear resistance, which complements the protective function of TBCs.

Collectively, these studies underscore the importance of combining material innovation, coating optimization, and computational modelling. FEA, in particular, proves essential for simulating thermal behaviour and guiding effective application of TBCs for piston performance and engine durability enhancement.

An effective strategy for reducing heat transfer within internal combustion engines involves the thermal insulation of components that are directly exposed to combustion gases. This is commonly implemented through the application of thermal barrier coatings (TBCs) which are engineered materials characterized by low thermal conductivity and high thermo-mechanical stability Ahmaniemi et al., (2004**).** In recent decades, ceramic and polymer-based TBCs have demonstrated significant potential in enhancing engine efficiency and thermal performance. Nevertheless, their widespread adoption requires comprehensive evaluation, considering both performance benefits and economic feasibility to ensure practical and cost-effective integration into engine systems.

Despite these advancements, existing studies often lack integrated simulations that assess both thermal and mechanical stresses on piston crowns under realistic combustion conditions. Additionally, the performance variations of TBCs when applied to different base materials—such as grey cast iron, aluminium alloys, and steel—remain underexplored, particularly in terms of their response to thermal fatigue.

This study aims to bridge these gaps by simulating the thermo-mechanical behaviour of coated diesel pistons and evaluating thermal stress distributions during combustion. Using finite

element (FE) thermal simulation tools, the performance of YSZ, Al_2O_3, and Al_2O_3+TiO_2 coatings applied to piston crowns made from grey cast iron is assessed.

2. Methodology

The piston material selected for this study is grey cast iron. This material was chosen due to its widespread application in engine components, attributed to its favourable mechanical strength, wear resistance, and thermal conductivity (Goriparthi et al., 2019). The mechanical and thermo-physical properties used in the simulation are detailed in Table 1. The piston geometry considered for the analysis has a diameter of 40 mm and a stroke length of 90 mm.

Table 1. Mechanical properties of grey cast iron. (Source: Sirigiri et al. 2020)

Parameter	Value
Density (kg/m^3)	7200
Young's Modulus (MPa)	110000
Coefficient of thermal expansion (1/K)	1.1 X10^{-6}
Poisson's Ratio	0.28
Elastic modulus (GPa)	124
Ultimate Tensile Strength (MPa)	240
Thermal conductivity (W/m/^{0}C)	52

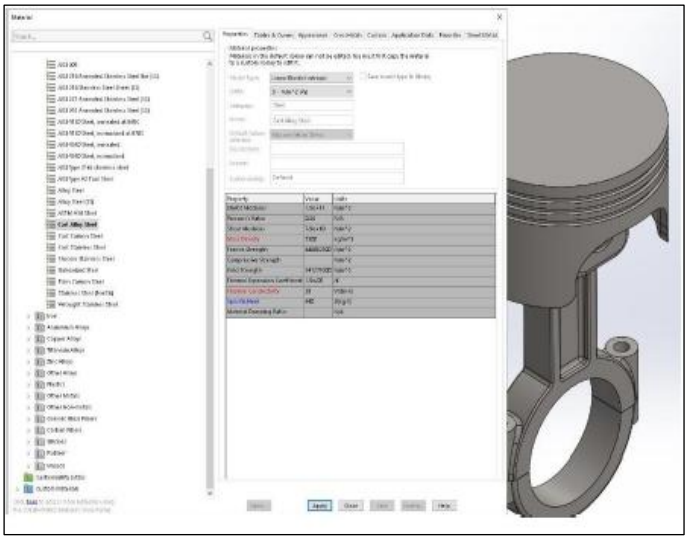

Fig. 1. Material specification input

The Figure 1 displays a SolidWorks interface showcasing the material properties of Cast Alloy Steel, assigned to a 3D piston model. Key thermal and mechanical properties include a thermal conductivity of 33 W/m·K, specific heat of 440 J/kg·K, and a mass density of 7300 kg/m³, which are crucial for simulating heat flow and thermal stress within an engine environment. With an elastic modulus of 1.6x10^{11} N/m² and tensile strength of 448 MPa, the material provides strong structural integrity. These properties are essential for assessing how the piston responds to high-temperature, high-load conditions during combustion in diesel engine analysis.

Three TBC materials were selected for evaluation based on their industrial relevance and prior research are Yttria-Stabilized Zirconia (YSZ), Al_2O_3+TiO_2 (Aluminium Oxide–Titanium Dioxide) and Al_2O_3 (Aluminium Oxide). The detail on these materials is shown in Table 2 and Figure 2. Material properties, including thermal conductivity, specific heat, Young's modulus and coefficient of thermal expansion, were obtained from literature and material databases. Each coating was modelled as a uniform 0.3 mm layer applied to the relevant surfaces.

Table 2. Thermal properties of TBC (Source: El-Mahallawi et.al. (2018))

Property	YSZ	Al_2O_3+TiO_2	Al_2O_3
Thermal Conductivity (W/m·K)	2.2 - 2.9	8	35
Coefficient of Thermal Expansion (μm/^oK)	12	9	5.4
Specific Heat(J/Kg.^0K)	552-653	740.6	880
Young's Modulus (GPa)	200	244	380

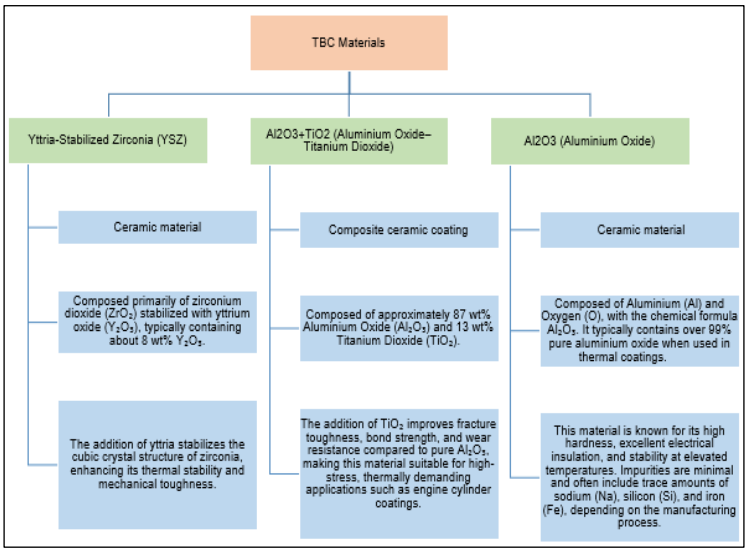

Fig. 2. Details on selected TBC

A detailed 3D finite element model of a diesel engine cylinder and piston crown was developed using ANSYS Workbench. The model geometry was simplified to reduce computational cost while preserving critical thermal and structural features. Meshing was performed using second-order tetrahedral elements, with refinement in regions of expected high thermal gradients.

Thermal loading conditions were based on typical diesel engine operation, with peak temperatures reaching up to 900°C at the piston crown surface and 600°C at the cylinder wall. A cyclic thermal profile was applied to simulate repeated engine firing conditions. Convective boundary conditions were applied to external surfaces, while heat flux was assigned to combustion-facing surfaces.

Structural simulations accounted for thermal expansion and temperature-induced stress using coupled thermal–structural analysis. Each model was subjected to the same number of thermal cycles to evaluate long-term performance.

Figure 3 presents a thermal simulation setup in SolidWorks, focusing on a piston assembly subjected to heat power loading. Specifically, a heat power of 350 Cal/s is applied to selected faces of the piston head to simulate combustion-induced thermal stress. This setup falls under the thermal Loads section and includes convection boundary conditions as well, indicating of heat dissipation to the surrounding media. This configuration allows for detailed finite element analysis (FEA) to evaluate the piston's temperature distribution, heat flux, and potential thermal deformation under operating conditions. Such simulations are essential for optimizing material selection and improving thermal performance in internal combustion engines.

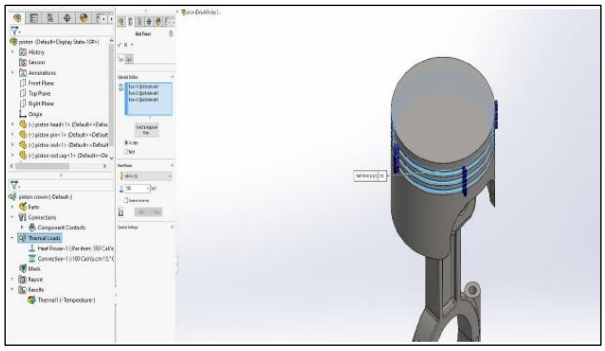

Fig. 3. Thermal load conditions setup

Figure 4 illustrates a thermal convection setup applied to a piston model in SolidWorks simulation. Selected external surfaces of the piston head are exposed to a convection coefficient of 100 Cal/(s·cm²·°C), with the ambient temperature set at 180 °C. This simulates the heat transfer from the piston to the surrounding air or coolant, a critical factor in thermal performance analysis. The applied boundary conditions help predict how the piston dissipates heat during operation, influencing its structural integrity and efficiency. This setup is vital for evaluating cooling effectiveness, preventing thermal fatigue, and guiding material and design choices in engine development.

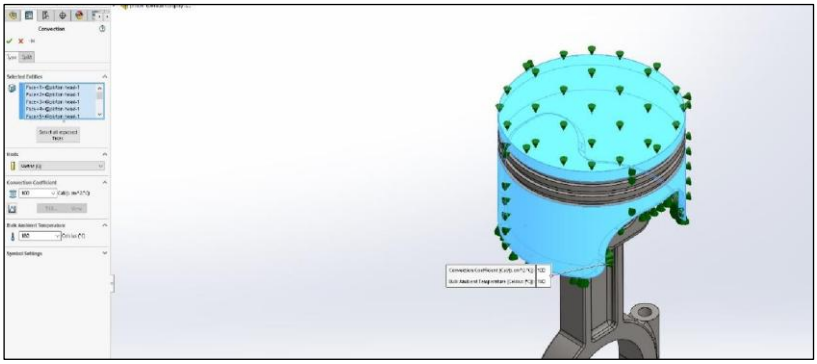

Fig. 4. Thermal convection setup

Thermal performance was assessed based on temperature distribution, thermal gradient across the coating, and maximum temperature at the substrate-coating interface. The primary performance indicators such as maximum operating temperature were compared across all three materials to determine the optimal coating for each engine component.

3. Results and Discussion

The simulation was conducted using thermal analysis to evaluate the performance of three different coating materials. Data were collected with a focus on the maximum temperature experienced by the piston crown. To analyze material qualities, many processes or a combination of various approaches may be necessary, depending on the purpose. This simulation is based on three coatings: YSZ, Al_2O_3+TiO_2, and AL_2O_3. Temperature data were collected with an emphasis on the maximum values observed on the piston crown for each type of coating, as illustrated in Figures 5, 6, 7, and 8.

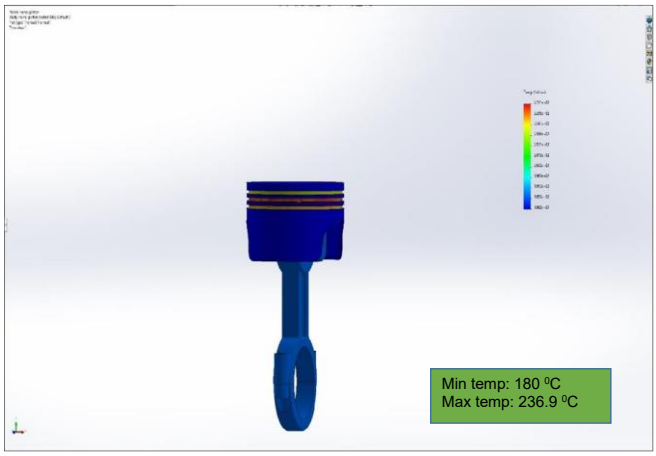

Fig. 7. Aluminium oxide–titanium dioxide (Al_2O_3+TiO_2)

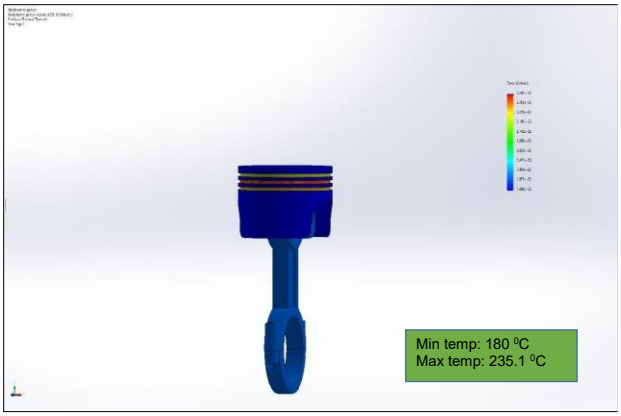

Fig. 8. Aluminium Oxide (Al_2O_3)

The thermal simulation of the piston crown under various coating conditions reveals a significant enhancement in thermal insulation compared to the uncoated configuration. In its uncoated state, the piston ring experienced the highest thermal exposure, with a maximum temperature of 363.1 °C and a minimum of 180.0 °C, indicating substantial heat transfer through the component surface. This wide temperature gradient highlights the extent of heat conduction through the piston ring material, suggesting limited resistance to thermal flow and high susceptibility to heat-induced wear and deformation.

By contrast, coated piston rings exhibit lower overall thermal loads, implying that the thermal barrier provided by the coatings effectively reduces heat transfer to the underlying substrate. The coatings act as a thermal shield, limiting the peak temperature experienced by the ring and promoting a more uniform temperature distribution across the surface. This not only contributes to improved thermal fatigue resistance but also enhances the durability and functional lifespan of the component under high-temperature operating conditions typical in internal combustion engines.

When coated with Yttria-Stabilized Zirconia (YSZ), the piston ring achieved the greatest thermal insulation performance, recording the lowest maximum temperature of 229.6 °C while maintaining the same minimum temperature of 180.0 °C. The YSZ coating effectively reduced heat transfer to the piston ring, demonstrating its superior thermal insulation properties. YSZ emerged as the most effective material, reducing the maximum temperature by 36.8%, in line with findings by Wang et al. (2018), who confirmed YSZ's superior phase stability and low thermal conductivity at elevated temperatures. This reduction in peak temperature suggests improved thermal fatigue resistance and greater durability of engine components, as previously emphasized by Sharma et al. (2024) and Hariram et al. (2022) in their respective FEM-based analyses of thermal stress and coating performance. This temperature reduction could potentially lead to improved engine efficiency and reduced wear on critical components. This reflects the superior insulating capability of YSZ under high-temperature conditions.

The Aluminium Oxide–Titanium Dioxide (Al_2O_3+TiO_2) coating yielded a slightly higher maximum temperature of 236.9 °C, with Aluminium Oxide (Al_2O_3) closely following at 235.1 °C. This slight difference in maximum temperature can be attributed to the unique thermal properties of the composite coating. The addition of Titanium Dioxide to Aluminium Oxide may have enhanced the overall thermal conductivity of the coating, leading to improved heat transfer characteristics.

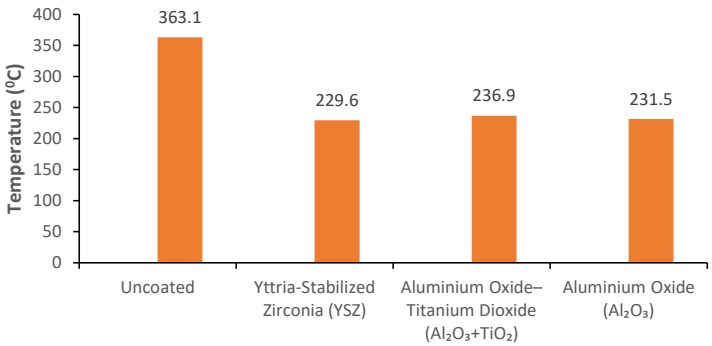

Fig. 9. Comparison of maximum temperature for the types of piston coatings

The bar chart in Figure 9 present the comparative thermal performance of piston rings subjected to different ceramic coatings: Yttria-Stabilized Zirconia (YSZ), Aluminium Oxide–Titanium Dioxide composite (Al_2O_3 + TiO_2), and pure Aluminium Oxide (Al_2O_3), in addition to the uncoated baseline. The primary variable evaluated is the maximum temperature (°C) reached during thermal simulation, which directly reflects the effectiveness of each coating in resisting heat transfer and insulating the substrate.

These results collectively indicate that ceramic coatings play a crucial role in the thermal management of piston rings. The reduction of temperature difference between uncoated and coated are YSZ = 36.8%; Al_2O_3 + TiO_2 = 34.8% and Al_2O_3 = 36.2%. The application of such coatings not only lowers the peak temperatures experienced by the component but also promotes a more uniform temperature distribution, thereby enhancing resistance to thermal gradients and mechanical fatigue. The findings support the strategic use of advanced ceramic coatings, particularly YSZ, in engine components operating under high-temperature conditions.

The study also highlights that Al_2O_3+TiO_2 and Al_2O_3 coatings offer notable improvements, though slightly less effective than YSZ. These results align with the conclusions drawn by El-Mahallawi et al. (2014), who observed improved hardness and wear resistance in composite ceramic coatings reinforced with TiO_2, supporting their role in thermal protection applications.

Overall, the application of thermal barrier coatings substantially reduced the thermal load on the piston. Among the coating tested, YSZ provided the most effective thermal protection, followed by Al_2O_3+TiO_2 and Al_2O_3. Currently, 6–8 wt.% Y2O3 stabilized zirconia (YSZ) is considered as a good choice for the ceramic top coat material due to its superior durability during thermal cycling, Wang et.al (2018). These results align with the thermal performance trends observed in the engine block, reinforcing the potential of ceramic-based coatings to enhance the thermal management of diesel engine components.

4. Conclusion

The primary objective of this study was to investigate the thermal insulation performance of three ceramic-based thermal barrier coatings (TBCs)—Yttria-Stabilized Zirconia (YSZ), Aluminium Oxide–Titanium Dioxide (Al_2O_3+TiO_2), and Aluminium Oxide (Al_2O_3)—applied to diesel engine piston crowns composed of grey cast iron. Using a finite element method (FEM) framework, the study sought to quantify thermal behavior and identify the most effective coating in mitigating thermal stress and peak temperature under combustion-representative loading conditions.

Among the evaluated materials, YSZ demonstrated the most superior thermal performance, reducing the peak temperature to 229.6 °C—a 36.8% decrease. Al_2O_3 and Al_2O_3+TiO_2 followed with reductions of 35.2% and 34.8%, respectively. These findings are consistent with

existing literature, particularly the work of Wang et al. (2018), which emphasized YSZ's low thermal conductivity and excellent phase stability under high-temperature cycling, and Sharma et al. (2024), who highlighted the benefits of ceramic coatings in reducing thermo-mechanical stress in piston components.

The outcomes of this study offer significant contributions to the field of engine thermal management by providing a comparative, simulation-based evaluation of widely used ceramic coatings. The quantified reduction in peak temperature across all coated cases not only confirms the efficacy of these materials but also emphasizes their practical relevance in improving thermal fatigue resistance and extending the operational life of critical engine components. In light of these findings, future research should incorporate experimental validation under real engine conditions to corroborate simulation accuracy. Additionally, the exploration of advanced coating architectures—such as multilayer or functionally graded systems, as proposed by Ahmaniemi et al. (2004)—could further enhance thermal performance and structural integrity. In summary, this study substantiates the effectiveness of ceramic-based TBCs, with YSZ emerging as the most thermally efficient coating for diesel engine pistons. These insights support the continued development and application of high-performance thermal protection systems in modern engine design.

Abstrak

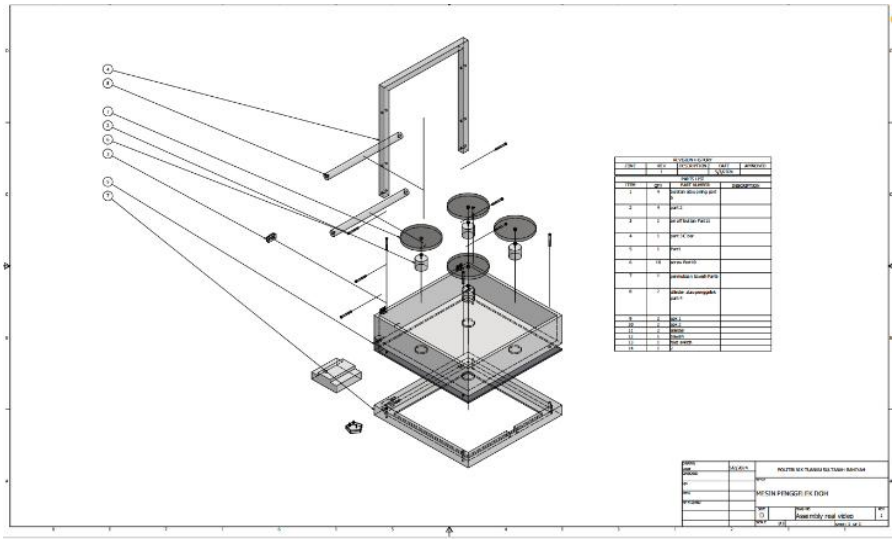
Tujuan projek ini dijalankan adalah untuk merekabentuk satu projek yang diberi nama *Kneading multi-bread.* Penggunaan mesin penggelek doh adalah penting dalam industri pembuatan roti seperti roti canai untuk meningkatkan keselamatan dan kualiti produk. Masalah yang timbul dari pembuatan doh secara manual kecederaan tangan akibat aktiviti berulang *repetition*, *contact stress*, ketepatan saiz doh, dan memerlukan tenaga pekerja untuk menggelek doh menggunakan tangan manusia. Oleh itu, kajian ini bertujuan untuk menghasilkan mesin penggelek doh yang tidak hanya memastikan kebersihan dan ketepatan saiz doh yang lebih baik, tetapi juga mengurangkan tenaga yang diperlukan oleh pengguna untuk mengelakkan kecederaan.Objektif utama adalah merancang mesin yang mampu menghasilkan doh dengan bentuk dan saiz yang seragam. Metodologi penyelidikan dijalankan menggunakan kaedah ujian campur tangan ergonomik dengan *Rapid Entire Body Assessment (REBA)* dan *Rapid Upper Limb Assessment (RULA)*. Analisis data telah dibuat terhadap inovasi ini menggunakan data sebelum dan selepas kaedah RULA dan REBA. Ujikaji juga dibuat dengan menentukan tahap kecederaan menggunakan prinsip faktor risiko yang boleh menyebabkan kecederaan pekerja dalam proses penghasilan doh untuk memastikan tahap kesihatan dan keselamatan pekerja.
Kata kunci: Rekabentuk; Mesin penggelek doh; Ergonomik.

1. Pengenalan

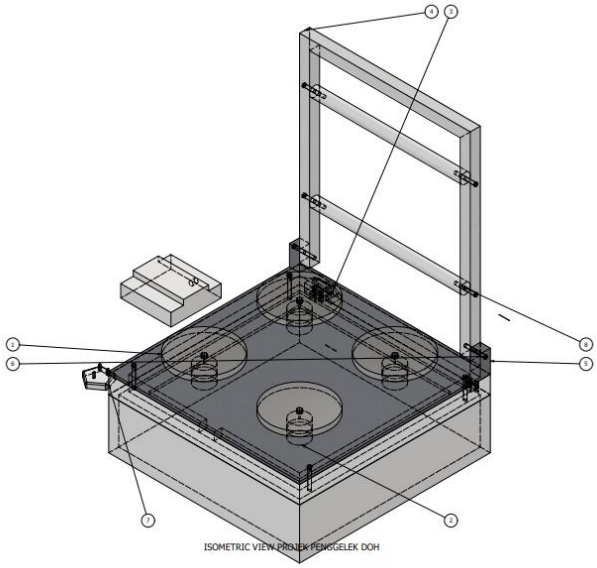
Perniagaan makanan tradisional adalah salah satu perniagaan yang paling popular pada masa kini. Salah satu daripadanya adalah perniagaan roti seperti roti canai, roti bom, roti Arab dan sebagainya. Hal ini kerana ia telah mengambil hati semua masyarakat berbilang bangsa di negara ini terutamanya bangsa Melayu. Doh roti diperbuat dari tepung gandum, air, sedikit minyak masak, telur gula, marjerin, pewarna dan sedikit garam. Roti berbentuk bulat kebiasaannya dibuat dengan kemas. Ia juga mudah diperolehi di kedai-kedai tepi jalan terutama semasa waktu pagi, yang merupakan sebagai juadah utama semasa sarapan pagi seperti roti canai.

Untuk menghasilkan doh roti ini, seseorang memerlukan teknik dan cara yang betul kerana jika tersilap langkah, ia akan tebal dan bentuknya tidak seragam seperti yang diinginkan. Doh roti dibuat menggunakan tangan ataupun acuan khas dan ia mempunyai pelbagai jenis acuan. Acuan yang paling mudah didapati di pasaran adalah acuan menguli roti canai. Dengan hanya membuat putaran, ia dapat menghasilkan doh roti (Roti Rolling Machine, 2019). Biasanya acuan ini digunakan oleh peniaga kecil-kecilan tetapi dengan menggunakan acuan ini, ia mengambil masa yang lama untuk menghasilkan sebiji doh. Tenaga juga banyak digunakan jika menggunakan acuan ini. Jadi dengan ini, projek yang bakal dilakukan ialah mesin uli doh roti atau *machine kneading multi-bread*. Penambahbaikan turut dilaksanakan dalam projek ini seperti membuat 4 doh dalam satu masa. Penjual roti dan suri rumah tidak perlu risau akan masalah yang dihadapi sebelum ini contohnya lenguh sakit pinggang dan sebagainya selain dapat menjimatkan masa apabila melakukan kuantiti doh roti yang banyak.

Rajah 1 adalah rekabentuk menunjukkan lukisan pemasangan dan pemasangan berserta *bill of material* yang memaparkan leraian setiap satu komponen mesin penggelek doh. Rangka dan struktur utama adalah pada bahagian bawah permukaan yang menggunakan besi tahan karat yang dijadikan tapak bertujuan untuk memberi ketahanan pada mesin penggelek doh. Bahagian seterusnya ialah keluli tahan karat *stainles steel*. Keluli tahan karat ini sesuai untuk produk makanan. Bahagian yang ketiga ialah motor yang berjenis DC berperanan menjadi penggerak mesin doh ini. Seterusnya, ialah *plate stainless steel* yang terdapat di mesin doh ini bertujuan untuk menggelakkan doh melekat dan tahan lasak. Bahagian yang kelima ialah penggelek yang bertujuan menggelek doh di atas permukaan *plate stainless steel*. Akhir sekali ialah besi yang beroperasi sebagai pemegang yang boleh digerakkan. Terdapat juga butang yang berfungsi sebagai 'tutup dan buka' apabila beroperasi dan tidak beroperasi. Tambahan pula, mesin ini mempunyai tempat cas yang bertujuan dapat beroperasi apabila ketiadaan elektrik. Skru adalah penyalur kepada penyambungan setiap item untuk mengukuhkan mesin doh. Rajah 2 menunjukkan lakaran keseluruhan mesin penggelek doh yang telah dicantumkan setiap komponen sehingga menjadi sebuah mesin pengelek doh.



Rajah 1. Lukisan pemasangan



Rajah 2. Lukisan keseluruhan projek

Kecederaan tisu disebabkan pengulangan kerja secara manual dalam proses menggelek bagi menyediakan makanan roti canai. Selain itu tahap risiko ergonomik, diperkenalkan dengan pendekatan RULA dan REBA. RULA menilai postur, gaya, dan gerakan suatu aktiviti kerja. Dengan pendekatan ini diharapkan risiko kecederaan dari pekerja dapat ditekan, biaya kesihatan akibat posisi yang salah dapat dikurangi, kenyamanan pekerja dapat ditingkatkan dan meningkatkan produktiviti dan prestasi pekerja *(RULA worksheet-USF health, 2024) (A Step-by-Step Guide to the REBA Assessment Tool, 2024)*. Proses pembuatan roti canai akan menyebabkan kecederaan seperti tangan tergeliat apabila meleperkan doh berulang kali. Selain itu masalah ketidakseragaman saiz doh apabila menggunakan cara manual (Jamil, 2009). Dengan menggunakan mesin ini separa automatik dapat mengurangkan kecederaan dan menjimatkan masa meleperkan doh.

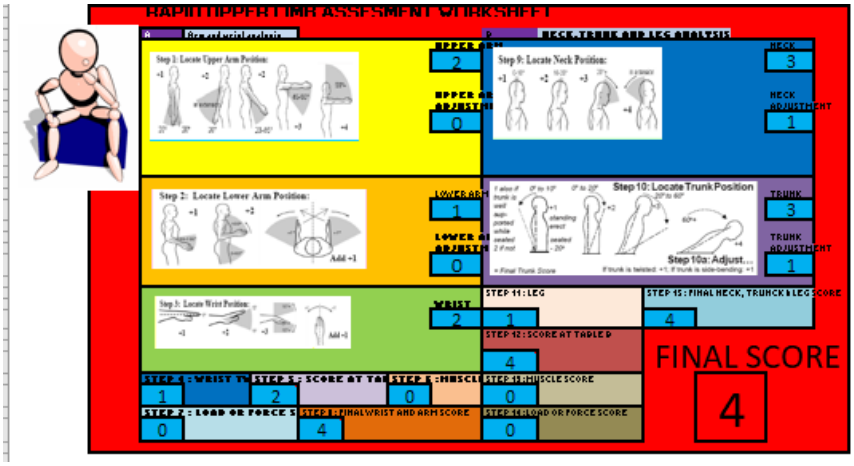
2. Metodologi

Penilaian berasaskan prisip ergonomik menggunakan kaedah RULA *(Rapid Upper Limb Assessment)* dan REBA *(Rapid Entire Body Assessment)* adalah dua alat penilaian ergonomik yang popular dan sering digunakan untuk menilai risiko gangguan muskuloskeletal (MSDs) yang berkaitan dengan postur kerja. Kedua-dua alat ini membantu pakar ergonomik mengenal pasti dan mengukur tahap tekanan fizikal pada pekerja, seterusnya membolehkan cadangan penambahbaikan dibuat. *(RULA worksheet-USF health, 2024) (A Step-by-Step Guide to the REBA Assessment Tool, 2024)*

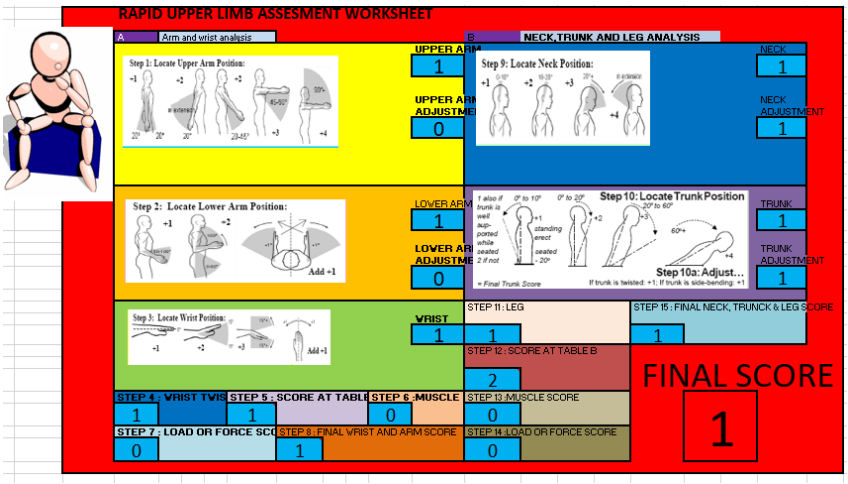
3. Dapatan dan Perbincangan

Cara kerja yang dijalankan secara manual adalah dari segi kerja yang berulang menggunakan tangan untuk mengelek doh iaitu pergerakan pengulangan *(repetition)* yang berulang kali dengan menggunakan tangan secara manual. Kesan ergonomik ialah tekanan sentuhan *(contact stress)* berlaku apabila sentuhan tekanan terkena permukaan yang kasar, contohnya proses menggelek doh dengan mengerakkan jari dan pengelangan tangan. Mesin penggelek doh membolehkan proses doh menjadi lebih cepat dan konsisten berbanding dengan cara manual. Ini membantu mengurangkan kerja manual dan pengelekan yang melibatkan tenaga pekerja. Seterusnya, produktiviti yang tinggi. Dengan menggunakan mesin penggelek doh, pengeluaran roti dapat ditingkatkan secara signifikan (ketara). Mesin ini mampu memproses jumlah doh yang besar dalam masa yang singkat, meningkatkan hasil pengeluaran secara keseluruhan. Di samping itu, ketepatan dalam ukuran dan bentuk. Mesin penggelek doh dapat diatur untuk menghasilkan doh dengan ukuran dan bentuk yang tepat mengikut keperluan. Lebih-lebih lagi, kawalan proses yang lebih baik, mesin ini dilengkapi dengan sistem kawalan yang canggih, membolehkan pengawalan kelajuan, dan parameter lain dengan lebih tepat. Ini membantu dalam mencapai hasil penggelekan yang optimum.

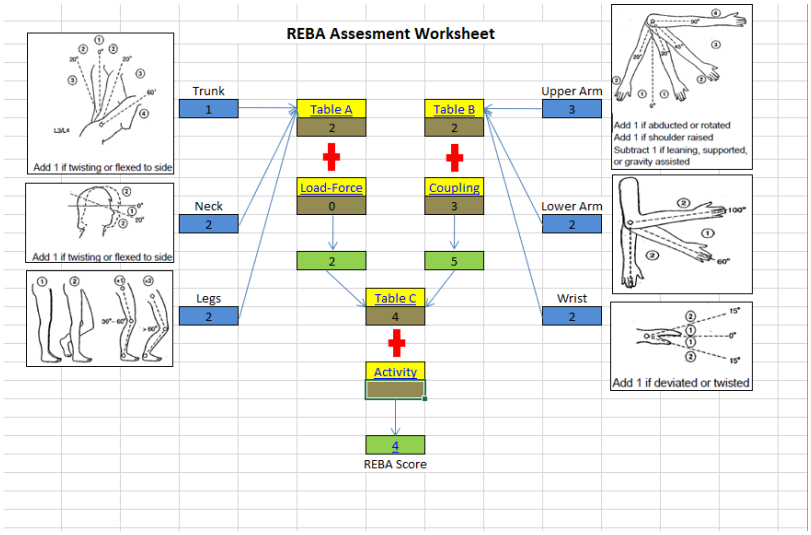
Kajian juga dibuat dengan menggunakan kaedah ergonomik iaitu RULA dan REBA. Kajian dijalankan dengan melihat pengurangan skor RULA dan REBA dan tahap risiko ergonomik tersebut dapat dikurangkan *(RULA worksheet-USF health, 2024) (A Step-by-Step Guide to the REBA Assessment Tool, 2024)*.Kajian ini mengenal pasti risiko ergonomik dalam proses manual penggelek doh menggunakan analisis RULA (skor risiko=4) dan REBA (skor=4), kemudian keputusan selepas merekabentuk mesin penggelek doh yang menurunkan skor risiko kepada 2 (RULA) dan 1 (REBA). Jadual 1 menunjukkan Skor tahap ergonomik menggunakan kaedah REBA dan RULA sebelum dan selepas menggunakan mesin penggelek doh.



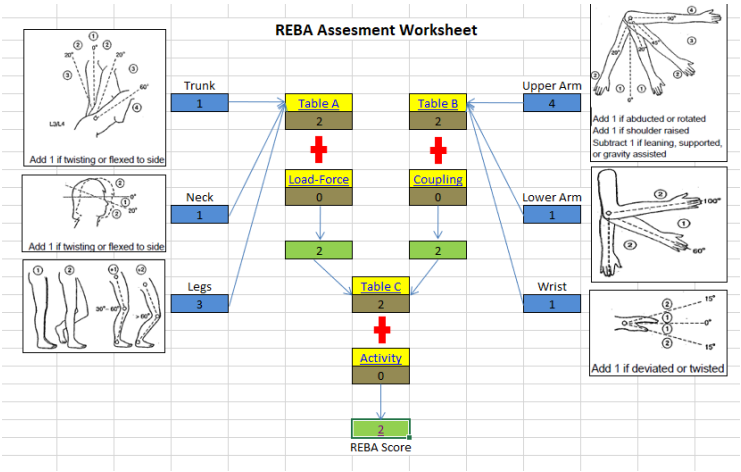
Rajah 3. RULA (sebelum)



Rajah 4. RULA (selepas)



Rajah 5. REBA (sebelum)



Rajah 6. REBA (selepas)

Jadual 1. Data skor REBA dan RULA sebelum dan selepas menggunakan mesin penggelek doh

Sebelum	Selepas
REBA (Skor 4)	REBA (Skor 2)
RULA (Skor 4)	RULA (Skor 1)

Rajah 7 dan 8 menunjukkan tahap bahaya dalam penilaian risiko REBA dan RULA yang melibatkan Postur kerja Sebelum dan Selepas menggunakan mesin penggelek doh. Rajah 7 menunjukkan pengurangan tahap risiko REBA iaitu nilai 2-3 adalah Risiko dapat diabaikan, tidak perlu tindakan. Rajah 8 menunjukkan pengurangan tahap risiko RULA iaitu nilai 1-2 adalah Risiko cedera muskuloskeletal sangat rendah atau tidak ada. Tidak ada tindakan perbaikan yang diperlukan.

REBA score	Risk Level	Action
1	Negligible	None necessary
2 - 3	Low	Maybe necessary
4 - 7	Medium	Necessary
8 - 10	High	Necessary soon
11 - 15	Very High	Necessary now

REBA score	Risk Level	Action
1	Negligible	None necessary
2 - 3	Low	Maybe necessary
4 - 7	Medium	Necessary
8 - 10	High	Necessary soon
11 - 15	Very High	Necessary now

Score	Action
1 or 2	Acceptable posture
3 or 4	Further investigation, change maybe needed
5 or 6	Further investigation, change soon
7	Investigate and implement change

Rajah 8. Perbezaan nilai skor RULA sebelum dan selepas

4. Kesimpulan

Kesimpulannya, rekabentuk dalam membangunkan peralatan ergonomik adalah penting dan kritikal. Tujuannya adalah untuk memastikan setiap peralatan, kemudahan, dan sistem yang digunakan dalam melaksanakan sesuatu aktiviti adalah sesuai dan serasi dengan manusia (M. C. Malek, M. A. F. Ujang, N. H. Mustapha, and A. Hashim, 2017). Ini bukan sekadar tentang keselesaan, tetapi merupakan pendekatan saintifik yang mendalam untuk mengoptimumkan interaksi antara manusia dan persekitaran kerja mereka. mesin penggelek doh dibangunkan menggunakan kaedah ergonomik agar tahan risiko bahaya dapat dikurangkan. Dengan penggunaan mesin penggelek doh pelbagai, proses penggelek menjadi jauh lebih efisien berbanding dengan penggelek manual. Mesin ini direka untuk menggelek empat doh sekaligus, yang secara drastik mengurangkan masa yang diperlukan untuk menyiapkan setiap doh. Akhir sekali, mesin penggelek doh ini yang dihasilkan ini mesra kepada pengguna, selamat dan mampu menjimatkan masa serta tenaga.

Abstract

The global rise of online shopping, driven by ease of use and a wide variety of products, has significantly transformed consumer behavior. In Malaysia, consumers frequently use platforms such as Shopee, Lazada, GoShop, and WowShop. However, this surge in e-commerce has exposed significant challenges in last-mile delivery, particularly in ensuring secure and weatherproof package receipt when recipients are not available. Addressing this gap, the Smart Parcel Box (SPB) prototype was developed as an innovative solution that integrates Internet of Things (IoT) technologies and Radio Frequency Identification (RFID) based security mechanisms. The SPB system employs an Arduino-powered motion detector to detect parcel insertion and sends real-time delivery notifications via Telegram, while its RFID-enabled door lock ensures restricted access. Evaluation results showed that the RFID system could detect cards accurately within a 10 mm range, achieving approximately 95% success. Meanwhile, Telegram alerts were delivered in an average time of 2 to 5 seconds, indicating the system's responsiveness and reliability. Additionally, the SPB prototype was designed to withstand Malaysia's variable climate, providing both security and weather resistance. This study presents the SPB as a cost-effective and scalable solution for improving parcel management, security, and user experience in Malaysia's growing e-commerce environment, while supporting Sustainable Development Goal 9 (SDG 9) by promoting innovation and resilient infrastructure.
Keywords: Smart parcel box; Internet of Things; Radio frequency identification detector.

1. Introduction

Online shopping has experienced global growth, particularly following the COVID-19 pandemic and Malaysia's Movement Control Order (MCO). It has become a preferred and safer option for consumers to meet their needs and wants, with increasing popularity observed across the country (Ru et al, 2021; Musa et al, 2022; Islam, 2024). This project explores the evolving trend of online shopping in response to increasingly busy lifestyles. This shift has transformed how people live, work, and shop in Malaysia, emphasizing the importance of enhancing business digitalization (Tajudeen et. al., 2025).

According to the Malaysian Communications and Multimedia Commission, 51.2% of the population participates in e-commerce, engaging in both buying and selling activities online (Syahirah, 2019). To attract consumers, online retailers employ various strategies such as discount vouchers, cash rebates, and enticing rewards. As a result, Malaysia's e-commerce market is rapidly becoming one of the largest in Southeast Asia (Nasution & T.A., 2023). Most Malaysians use their mobile phones for online shopping (Barry et. al., 2024), with platforms like Lazada, Shopee, Mudah.my, GoShop, and WowShop are gaining significant popularity.

Despite the surge in online shopping, consumer concerns persist. Common issues include delayed deliveries, non-receipt of products, inaccurate delivery time information, and poor after-sales services (Y. S. Lim & Wan Ahmad, 2024). Additionally, the absence of recipients during delivery presents another challenge. According to the Malaysian Ministry of

Communications portal, a total of 186 complaints regarding courier services were received by the Ministry of Domestic Trade and Consumer Affairs (KPDNHEP) from January to June 30 of this year. The highest number of complaints involved customers not receiving their ordered goods (94 cases), followed by lost packages (33), damaged items (14), and goods being delivered in incorrect packaging (8). These statistics highlight the urgent need for proactive measures to ensure deliveries are completed safely and securely, protecting both the consumer and the courier.

In response to these issues, this study introduces the design, development, and evaluation of a Smart Parcel Box (SPB) prototype aimed at enhancing the safety and security of delivered packages. The SPB provides secure and weatherproof storage, equipped with an RFID card-based locking system (Zainuddin et. al., 2024). It also integrates an IoT system to notify users of their deliveries, leveraging IoT's ability to analyze sensor data and facilitate interaction between physical and digital environments (Logeswaran et. al., 2024). Moreover, IoT technologies through the connectivity of devices, sensors, and systems enable real-time data acquisition and analysis, supporting the efficient management of infrastructure, resources, and urban services (Neoaz N., 2025).

The idea of the Smart Parcel Box (SPB) was sparked by recurring problems such as delivery items frequently being lost or damaged during the delivery process (Zarin et al., 2024; Zainuddin et al., 2023). This often occurs when recipients are not at home, typically due to work commitments, leading couriers to leave parcels unattended outside the house. Such unattended deliveries increase the risk of package theft and accidental damage. Moreover, items packaged in cardboard boxes are particularly vulnerable to environmental exposure, especially during rainy weather, which can result in significant damage to the contents (Ahamad et al., 2024; Zainuddin et al., 2023). These issues are compounded by the lack of secure, weatherproof storage solutions for parcels and the inefficiency of current notification systems, which may delay or fail to inform recipients promptly about delivery statuses. The objectives of this SPB are to:

- Design a theft-resistant and weatherproof parcel box.
- Develop a parcel box equipped with an RFID-based locking system.
- Implement real-time parcel arrival notifications via Telegram using IoT technology.

2. Methodology

Figure 1 shows the development process of the SPB prototype follows a structured workflow to ensure proper integration of both mechanical and electronic components. The process begins with the design phase, where the overall structure and system layout are conceptualized. Following this, the frame is constructed using external connections and welding techniques to ensure structural stability. Once the physical assembly is complete, the next step involves establishing the electronic circuitry for the RFID and IoT systems. The circuit is then subjected to a testing phase to verify its functionality. If the circuit test is unsuccessful, adjustments and modifications are made before retesting. However, if the circuit is found to be successful, it is then integrated into the final project. The workflow concludes with the finalization of the project, ensuring all components are functioning as intended.

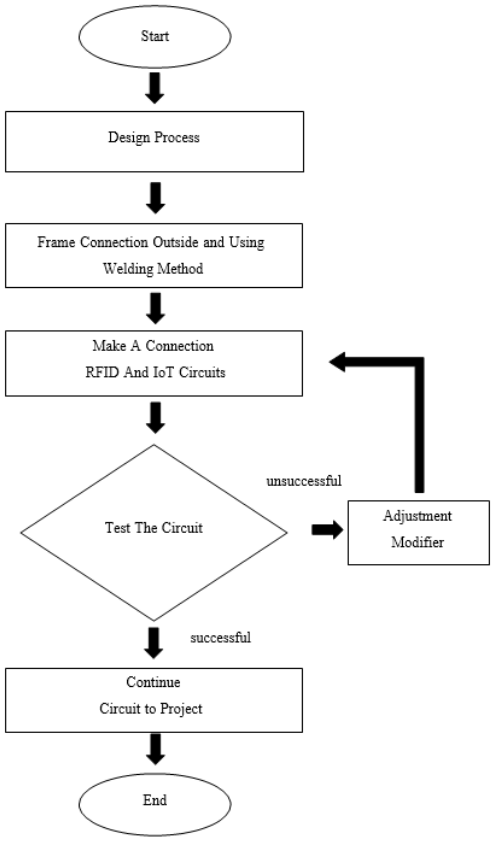

Fig. 1. Flowchart for SPB development

The flowchart in Figure 2 illustrates the operational process of the SPB prototype. The process begins when the sender places a parcel into the SPB. Once a sensor detects the parcel, the system automatically sends a notification to the recipient. To retrieve the parcel, the recipient must authenticate access by using an RFID card, which activates the locking mechanism.

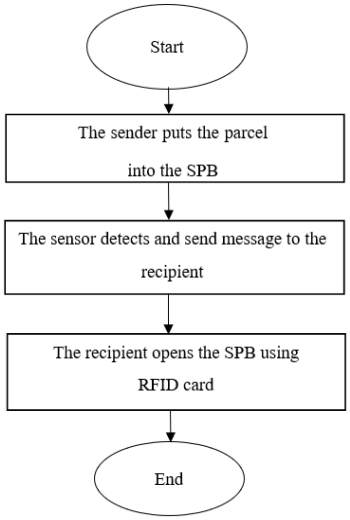

Fig. 2. Flow process of SPB

The product design specification will give a clear idea of the requirements needed to design the SPB. The main criteria considered for the product design are shown in Table 1 below. The mechanism determined includes sensor, RFID locking system and IoT.

Table 1. Specification of SPB

No.	Description	Specification
1	Name	Smart Parcel Box
2	Mechanism	RFID (Mifare RC522), IoT (Esp32)
3	Target Customer	Landed house owner/rent
4	Process	Receiver, Locking
5	Material	Aluminum 5052 (casing); Mild Steel (Frame)
6	Safety	RFID lock
7	Sensor	Ultrasonic sensor

This section will explain the development of the SPB, including the proposed design, the final design, circuits, and programming. At the initial stage, there are three proposed designs that have the potential to be developed as shown in Table 2.

Table 2. Product design concept

Ideas	Design	Descriptive
1		Idea 1: The parcel box features a stainless-steel roof for durability, with aluminum side panels to keep the structure lightweight. The opening mechanism employs a gear system consisting of a driven gear and a crank to automatically release the package when inserted. To enhance security, the box is equipped with a manual padlock to prevent theft.
2		Idea 2: The SPB is constructed from 5052 aluminum and mild steel, a highly durable material known for its excellent resistance to corrosion and weather elements. To further enhance its longevity, the surface is coated with weather-shield paint specifically designed for metal, effectively slowing down the rusting process and protecting it from harsh conditions. One of the key features of the SPB is its spacious interior offering twice the storage capacity compared to typical options while maintaining an affordable price, addressing a common issue faced by many households.

3		Idea 3: Focuses on a modernized design approach. The sleek and advanced looking exterior offers strong visual appeal while maintaining the same level of functionality and durability as earlier designs. However, this concept comes with certain drawbacks namely, higher production costs and longer manufacturing time. Additionally, it lacks a bottom cushioning system, which means heavier parcels may suffer minor dents upon delivery.

After careful evaluation of all three concepts, Idea 2 was selected for prototype development. This design was chosen due to its balanced combination of durability, functionality, and user convenience. Constructed from 5052 aluminum and coated with weather-resistant paint, the SPB offers excellent protection against outdoor elements. Its spacious interior, twice as wide as standard options, and competitive pricing directly address key concerns faced by users.

Table 3. Comparison with previous design

Name	Smart Parcel Receiver Box (Zarin et. al., 2024)	e-Box (Ahamad et. al., 2024)	SPB
Material	Acrylic	Acrylic	Aluminum 5052 and mild steel
Locked System Design	QR code and database	QR and SG90 micro servo	RFID

Table 3 presents a comparison between the SPB and two previous parcel box designs: The Smart Parcel Receiver Box (Zarin et. al., 2024) and the e-Box (Ahamad et. al., 2024). In terms of materials, the Smart Parcel Receiver Box and e-Box utilized acrylic. In contrast, the SPB is constructed using aluminum and mild steel, offering enhanced durability and weather resistance. For the locking mechanisms, the Smart Parcel Receiver Box employed a QR code and database system, whereas the e-Box combined a QR code with an SG90 micro-servo for access control. The SPB differentiates itself by integrating an RFID-based locking system, which offers a contactless and secure method of access. Visually, each design also reflects its functional approach, as shown in the accompanying images. Overall, the SPB advances beyond previous designs by incorporating stronger materials and more reliable access technology, making it a robust and scalable solution for secure parcel delivery.

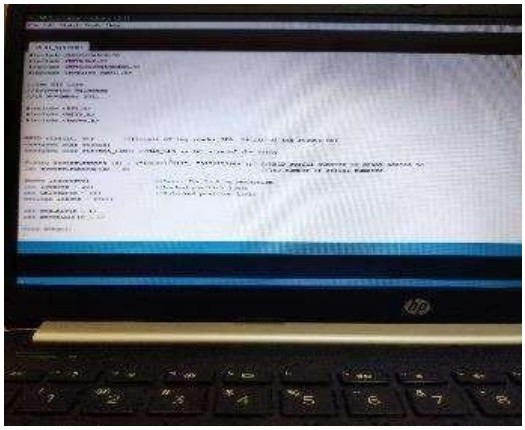
The material selection for the Smart Parcel Box (SPB) is based on its need to withstand outdoor conditions. Mild steel is used for the frame due to its natural resistance to corrosion and its ability to endure exposure to chemicals, fresh water, and salt water, making it ideal for harsh environments (Zhang et al., 2024). For the casing, aluminum 5052 is selected for its excellent corrosion resistance, lightweight properties, and high strength. This alloy is particularly suited for outdoor use as it resists rust and weather-related damage, ensuring long-term durability while keeping the structure easy to handle and install (Figure 3).

Fig. 3. Smart parcel box

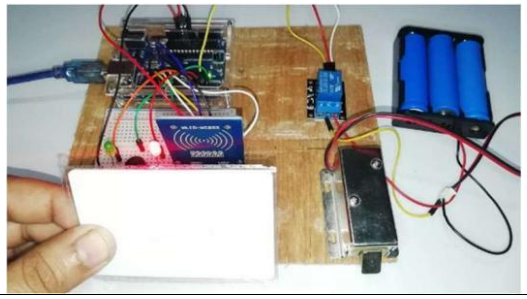
The setup process for the Arduino-based RFID system involves four key steps (Table 4). First, the printed circuit is labelled and printed clearly to ease circuit assembly. Second, the Arduino UNO R3 is connected to the MFRC522 RFID module according to the labelled circuit diagram, ensuring proper connections to avoid damage. Third, coding is performed using Arduino Software to upload the desired signal and test the functionality. Finally, the complete RFID system is installed with the Arduino and tag reader securely in place.

Table 4. RFID electrical fabrication process

Figure	RFID Process and Description
	The circuit layout should be clearly labeled prior to printing to simplify the wiring and assembly process. High-resolution printing is recommended to ensure visibility of all component markings.
	The process of connecting the Arduino UNO R3 circuit to Mifare RC522 which is a tag reader according to the printed circuit that has been printed and make sure the circuit connected is correct so that the tag reader module is not damaged.



The next step involves programming the Arduino using its development software to upload the desired instructions, followed by testing to confirm that the system operates as intended.



The last process is the installation of the Arduino with the RFID tag reader.

The SPB also incorporates an IoT system to notify users when a parcel has been delivered. The IoT setup includes an Arduino Uno, an ultrasonic sensor (HC-SR04), and a NodeMCU ESP32. This system is installed beneath the SPB. When a parcel is placed inside and hits the base, the ultrasonic sensor detects its presence. The Arduino Uno, functioning as the control unit, processes this signal and communicates with the NodeMCU ESP32, which provides internet connectivity via Wi-Fi or a mobile hotspot. Once the presence of a parcel is confirmed, a real-time notification is sent to the user's smartphone through the Telegram application using a programmed Telegram Bot. The ultrasonic sensor can accurately measure distances from 2 cm to 400 cm and is unaffected by sunlight or object colour, ensuring reliable performance. This system enhances user awareness and security by delivering instant alerts whenever a package arrives.

There are three types of technical drawings that have been prepared in this section. Figure 4 shows a 3-dimensional drawing in a 2-dimensional drawing by viewing along the parallel lines that are perpendicular to the plane of the drawing. Usually consist of Top view, Side view and adjacent items. Figure 5 shows all the components of the SPB.

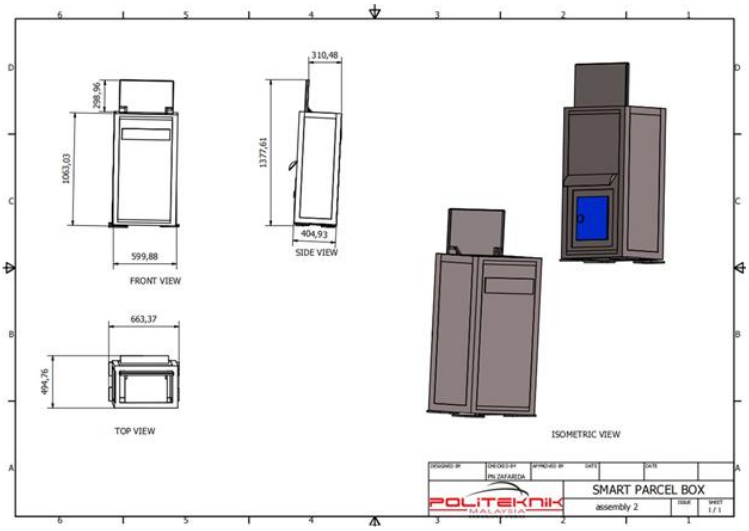


Fig. 4. Installation drawing

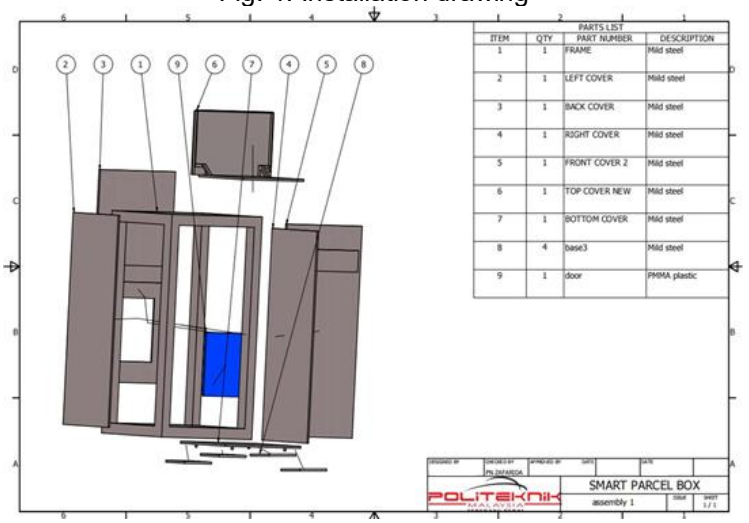

Fig. 5. Orthographic Drawing

Figure 6 shows a detailed drawing and provides a detailed description of the geometric form of a part of an object. They tend to be large-scale drawings that show in detail parts that may be included in less detail on general arrangement drawings. Detail drawing used to demonstrate compliance with regulations and other requirements.

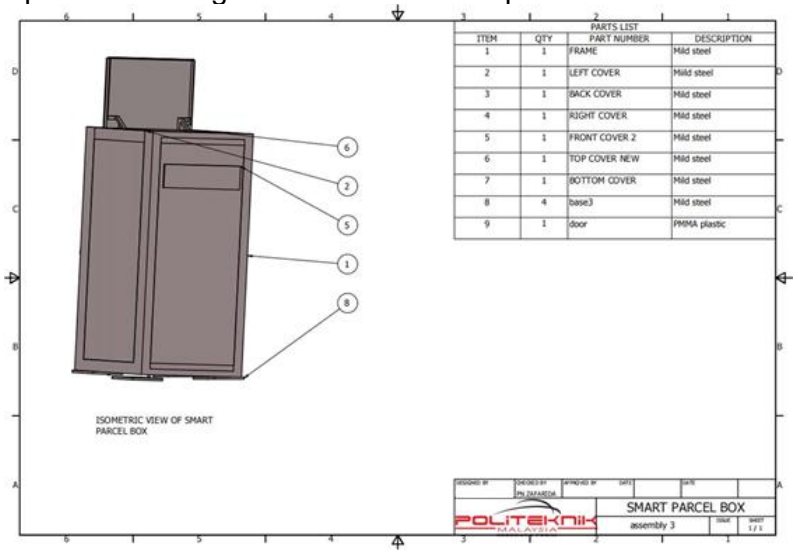

Fig. 6. Detail drawing

3. Results and Discussion

To evaluate the performance of the sensors used in the SPB prototype, a series of tests were conducted focusing on the detection rate and effective contact distance (Table 5). These tests aimed to determine how far the sensors could operate reliably and how quickly they responded. In Series 1, with a contact distance of 10 mm, both the RFID sensor and motion detection sensor successfully detected presence. In Series 2, at 50 mm, the RFID sensor failed to detect, while the motion sensor continued to respond accurately. In Series 3, with a 100 mm distance, both sensors failed to detect movement or tags. These results demonstrate that the RFID sensor operates most effectively within a short range of approximately 10 mm, while the motion detection sensor is more robust up to 50 mm. In addition, delivery notifications were successfully sent via Telegram within an average of 2–5 seconds, indicating that the IoT communication system is responsive and reliable. This testing highlights the importance of sensor placement and distance calibration in ensuring optimal performance for secure and timely parcel detection within the SPB system.

Table 5. Comparison rate of detection for the sensor

Test	Contact distance (mm)	RFID sensor detection	Motion detection sensor	Notification time frame (s)
Series 1	10	Yes	Yes	2
Series 2	50	No	Yes	4
Series 3	100	No	No	5

Based on the stated objectives, the SPB is designed to provide a safe, efficient, and user-friendly solution for receiving and storing parcels.

The primary goal of the SPB is to ensure that packages can be received securely and remain protected from environmental conditions. The design features a robust manually operated door system at the top, which allows for easy insertion of parcels while maintaining security. The bottom door, where the package is stored, is designed to be resistant to forced entry and repeated use. The use of durable materials such as mild steel for the frame and 5052 aluminum for the casing ensures weather resistance and structural integrity.

Security is further enhanced through the integration of RFID card technology as the locking mechanism. This system enables only authorized users such as the homeowner to access the parcel box. The door at the bottom opens and closes using the RFID key system, which offers a reliable and secure method for access control.

To improve user convenience, the Smart Parcel Box (SPB) uses an IoT system to send real-time notifications upon package delivery. The system includes an Arduino Uno, an HC-SR04 ultrasonic sensor, and a NodeMCU ESP32, which connects to the internet using Wi-Fi or a mobile hotspot. When a parcel is dropped inside the box, the sensor detects it and sends a signal to the user's smartphone. Notifications are delivered through the Telegram application.

4. Conclusion

The developed SPB prototype presents an innovative approach to overcoming key challenges in last-mile logistics, particularly related to theft, damage, and undelivered parcels. By providing a secure, weather-resistant, and tamper-proof storage system, SPB ensures that parcels remain safe until collected by the rightful recipient. Its secure locking mechanism, enhanced by RFID technology, allows for authorized access without the need for physical interaction between recipients and delivery personnel. The system further improves delivery efficiency by sending real-time notifications such as through Telegram upon parcel arrival,

streamlining the process and enhancing user convenience. This automation reduces the workload on delivery staff and eliminates the need for manual coordination, making it an ideal fit for high-volume urban environments.

SPB represents a significant step forward in parcel management, enhancing not only the user experience but also contributing to smarter and more resilient urban infrastructure. Its alignment with Sustainable Development Goal 9 (SDG 9) underscores its role in promoting innovation and sustainable industrial growth. As online shopping continues to rise, solutions like SPB will be essential to support efficient, secure, and scalable delivery systems. To accelerate its adoption and maximize impact, pilot testing in collaboration with major e-commerce platforms such as Shopee, Lazada, or Mudah.my is recommended. These partnerships can help validate the system's performance in real-world scenarios, build consumer trust, and guide future improvements. While challenges such as cost and scalability remain, the long-term benefits position SPB as a promising innovation for the evolving digital economy.

Abstract

Solar power has become a leading renewable energy option, replacing traditional sources because of its significant ecological and financial advantages. Solar energy is commonly utilized through solar collectors, one of its key applications. The fundamental challenge in solar collector analysis lies in characterizing the internal heat transfer mechanisms. By applying mathematical modelling, the heat transfer mechanism can be determined**.** Flat Plate Base-Thermal Cell Absorber (FPBTCA) under passive conditions. The modelling analysis was conducted over a 60-minute period, with peak solar radiation recorded at 860.034 W/m². Through iterative calculations, the heat input and output were compared until an energy balance with less than 5% error was achieved. The results indicate that the thermal cell's energy balance significantly influences FPBTCA performance. As expected, heat input rises with increasing solar radiation. The analysis revealed that FPBTCA achieves its highest efficiency (30.24%) at the 360-minute mark, while the Flat Plate Solar Collector (FPSC) reaches 21.81% efficiency at the same time. In terms of heat conduction (J), FPBTCA outperforms FPSC, recording 2424.91 J compared to FPSC 1749.06 J at 360 minutes when solar radiation was at its peak (860.03 W/m²). The thermal cell absorber is designed to store heat energy from solar radiation, ensuring usability even during cloudy conditions by transferring stored heat to the absorber base.

Keywords: Flat-surface solar thermal panel; Solar thermal absorption cell; Sun-powered heat collector.

1. Introduction

The primary function of a flat plate solar collector is to absorb incoming solar radiation and transform it into useful thermal energy. These collectors feature a flat, rectangular, and insulated surface with a dark-coloured absorber plate. A transparent cover, usually made of glass or plastic, traps incoming solar radiation, creating a greenhouse effect within the collector. Solar collectors harness sunlight and transform it into usable heat energy, playing a vital role in applications such as domestic use, water heating, and power generation. Solar collectors are available in multiple designs, each suited to applications. The predominant varieties include flat-plate, evacuated tube, and concentrating solar collectors (P. Kurniawati, 2017).

Mathematical modelling is essential for optimizing flat plate solar collector designs. It allows engineers and researchers to predict performance under various conditions, leading to more efficient and cost-effective systems [2]. The initial step in mathematical modelling involves understanding how the collector absorbs solar radiation. This analysis involves solving sophisticated equations that account for incident angle variations, absorber plate reflectance properties, and solar spectral characteristics. The absorbed solar energy undergoes thermal

transfer via conduction, convection, and radiation pathways within the collector system. Accurately modelling these processes is crucial for optimizing energy conversion. The effectiveness of flat plate solar collectors is primarily measured by their efficiency. Through mathematical models, engineers can calculate thermal efficiency, providing insights into the energy conversion capabilities of the collector.

The earliest stationary models for solar collectors, introduced by Hottel and Woertz (1942) and later refined by Hottel and Whillier (1958), were based on a zero-capacitance assumption, neglecting thermal inertia effects. These models assume a constant overall heat loss coefficient and instantaneous equilibrium with ambient conditions, simplifying analysis but ignoring dynamic environmental variations. Kalogirou (2004), demonstrated the advantages of transient modelling by simulating flat-plate collector performance in Cyprus, revealing efficiency gains through optimized designs. Unlike costly and limited experimental methods, computational modelling allows cost-effective testing across diverse conditions, enabling engineers to predict system behavior accurately using empirical correlations.

By modelling flat-plate collector performance in a transient state, the study established model accuracy through flow rate-controlled experiments (Saleh, 2012). The study confirmed that numerical predictions closely matched real-world efficiency, bridging gaps between theoretical and distributed models. Further insights came from the researcher (Hamed et al., 2014), whose parametric sensitivity analysis linked higher water flow rates to reduced output temperatures and heat loss coefficients. Their energy balance model showed that input temperatures rise proportionally with output temperatures.

There are other findings that applied a distributed mathematical model to solar dryer collectors, finding that excessive collector length diminishes returns due to weakened heat transfer driving forces (Amankwah et al., 2017). Their spatially discretized model validated simplified lumped-temperature assumptions, highlighting airflow velocity's role in heat loss and efficiency. The application of modelled a PV/T air collector using 1D energy balance equations in MATLAB (Wahida Khalili et al., 2019). Results confirmed that fluid-based heat extraction lowers operating temperatures, boosting efficiency, while solar radiation intensity critically impacts performance. This research paper focuses more on mathematical modelling analysis of the Flat Plate Base-Thermal Cell Absorber (FPBTCA) in outdoor conditions.

2. Methodology

The absorber plate temperature data were acquired through an Applent Technologies AT4208 Multi-Channel Temperature Meter (8 channels), while incident solar radiation was measured using an Apogee Instruments Pyranometer. Measurement accuracy was maintained by continuous solar flux monitoring with a TES-1333R Solar Power Meter featuring integrated datalogging functionality. All measurement devices were subjected to comprehensive calibration protocols prior to testing. To Controlled Testing Protocol, the investigation was performed in a laboratory environment with the following parameters:

Artificial solar radiation intensity: 700 W/m²
Test cycle:

- Charging phase: 300 seconds with active solar simulation
- Discharging phase: 300 seconds without radiation input

Operational conditions:

- Airflow velocity: 0.62 m^3/s (constant fan speed)
- Glass cover thickness: 2.0 mm

Temperature profiles were logged at 1-second resolution, with subsequent data processing and visualization. The carefully controlled experimental setup ensured repeatable conditions

for thermal performance characterization. Figure 1 FPSC Design: (a) and 1(b) illustrate the top and side views of the aluminum absorber within the flat plate solar collector (FPSC). The FPSC assembly includes key components such as:

- Flat plate absorber collector
- Glass cover
- Collector box
- Bottom plate
- An outlet fan
- Bottom-side insulation

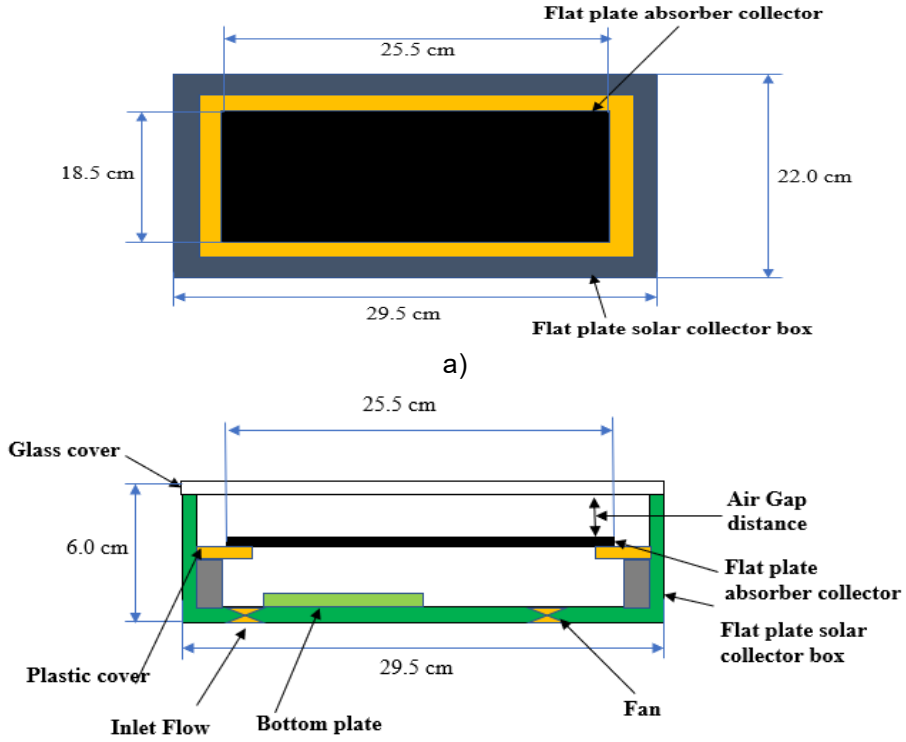

Fig. 1. FPSC Design: a) Top view, b) Side view of FPSC diagram

The thermal measurement setup for the FPSC is shown in Figure 2, which indicates the placement of three temperature sensors:

- T1 - positioned at the base (dummy load measurement)
- T2 - monitoring the drying chamber temperature
- T3 - recording the exhaust air temperature

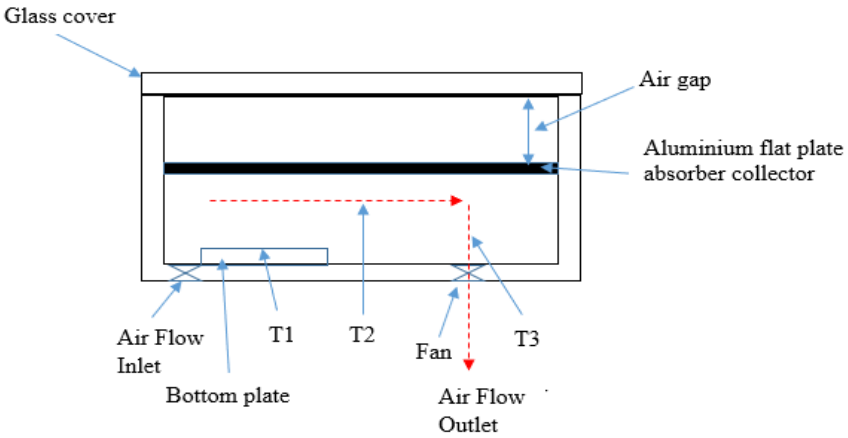

Fig. 2. Measurement setup for FPSC

Figure 3 displays the FPBTCA with thermal cell attachments (a) top view and (b) side view. The design compared aluminum and steel thermal cells within a system containing: absorber plate, test cells, glass cover, enclosure box, base structure, fan outlet, and insulation. A 1 cm air space separated components, with thermal cells mounted on the absorber surfaces.

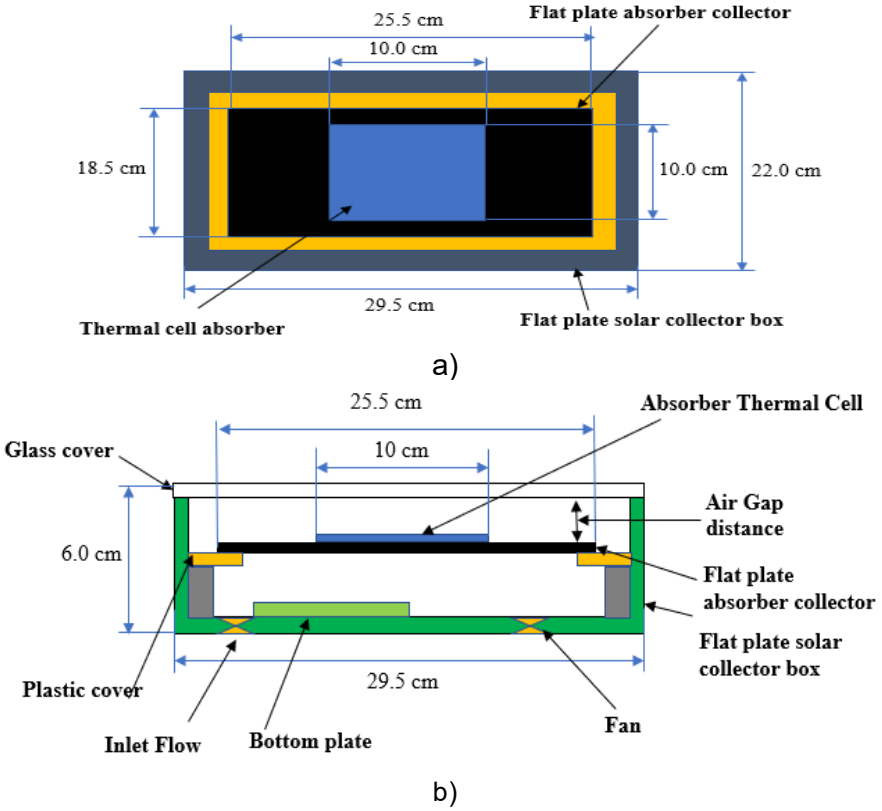

Fig. 3. FPBTCA Design: a) Top view of FPBTCA b) Side view of FPBTCA.

Figure 4 illustrates the thermal measurement setup implemented for the FPBTCA system, detailing sensor placement and data acquisition points. The experimental setup employed three strategically placed temperature sensors:

- T1: Positioned at the base plate (functioning as a dummy load)
- T2: Measuring internal drying chamber conditions
- T3: Recording exhaust air temperature at the fan outlet

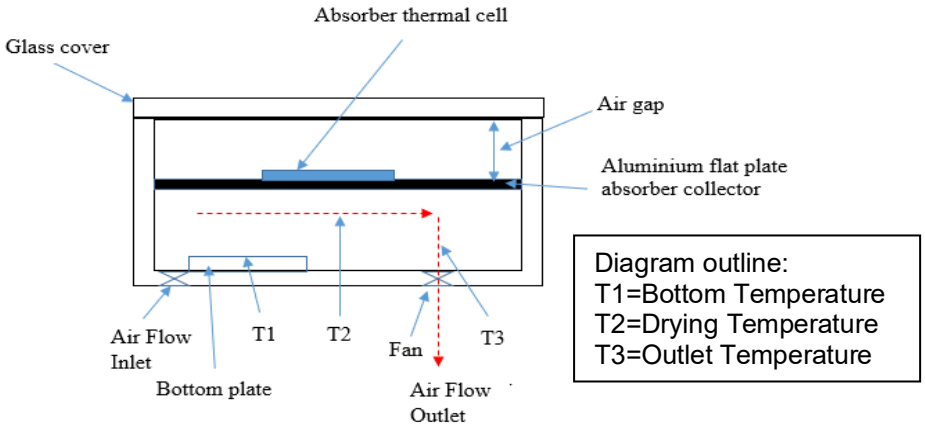

Fig. 4. Temperature sensor location for FPBTCA

Table 1 details the experimental setups for both collector types. The baseline FPSC configuration utilizes a 0.5 mm thick aluminum absorber plate (73 g mass) with dimensions 0.185 × 0.255 m. The modified FPBTCA design incorporates 1.0 mm thick stainless steel thermal cells (148 g mass, 0.01 × 0.01 m dimensions) mounted atop the aluminum absorber.

Table 1. Experiment table for FPSC and FPBTCA configurations

No	Type of case	Types of absorbers (base)	Thermal cell	Thermal cell thickness (mm)	Total weight (g)	Size (m)
1	FPSC	Aluminum	None	None	73	None
2	FPBTCA	Aluminum	Stainless Steel	1.0	148	0.010x0.010

Thermal energy, commonly referred to as heat, represents the transfer of energy between systems resulting from temperature gradients. This energy exchange occurs as systems transition between equilibrium states. The system's thermal equilibrium can be quantified using Equation (1), which establishes the fundamental energy balance relationship.

$$\dot{E}_{\text{in}} - \dot{E}_{\text{out}} = \frac{dE_{system}}{dt} \quad (1)$$

The FPBTCA's operational characteristics can be described through several carefully selected assumptions that balance computational simplicity with modelling precision (W. A. Duffie, 1991):

- The temperature gradient across the cover is negligible.
- The cover does not absorb solar energy.
- Minimal temperature drop occurs through the cover.
- The cover is opaque to infrared radiation.
- One-dimensional heat conduction applies to the back/side insulation and cover.
- Temperature gradients along the flow direction and between tubes are treated independently.
- Front and back heat losses occur at the same ambient temperature.
- The sky behaves as a blackbody for long-wavelength radiation at an equivalent sky temperature.
- Dust and dirt accumulation effects are negligible.
- Absorber plate shading is insignificant.
- Thermophysical properties remain constant (temperature-independent).
- The collector length is assumed sufficiently short to maintain uniform thermal characteristics throughout (Less than 10 m) (A. Fudholi et., 2008).

Figure 5 illustrates the thermal equilibrium schematic for the FPBTCA system, depicting the layered heat transfer structure from top to bottom, with Glass 1 (outer protective layer), Glass 2 (secondary glazing), Thermal cell (active component), Absorber base (primary heat collection surface), Dummy load (thermal mass), and Bottom insulation layer.

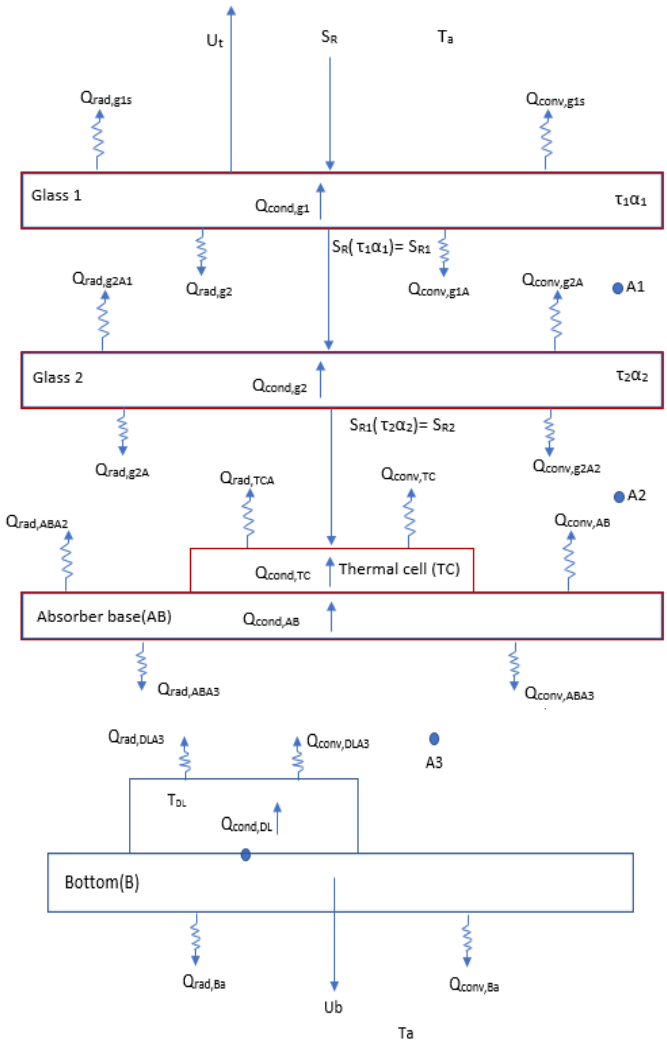

Fig. 5. Energy balance diagram for FPBTCA system

Were,

Energy balance for glass glass 1,
Energy in to the glass glass 1= Energy out of glass glass 1

$$S_R\tau_g\alpha_g + \dot{Q}_{rad,g1A1} + \dot{Q}_{conv,g1A1} = \dot{Q}_{rad,g1s} + \dot{Q}_{conv,g1s} + \dot{Q}_{cond,g1} \quad (2)$$

Energy balance for glass glass 2,
Energy in to the glass glass 2= Energy out of glass glass 2

$$S_{R1}\tau_g\alpha_g + \dot{Q}_{rad,g2A2} + \dot{Q}_{conv,g2A2} = \dot{Q}_{rad,g2A1} + \dot{Q}_{conv,g2A1} + \dot{Q}_{cond,g2} \quad (3)$$

Energy balance for thermal cell absorber,
Energy in to the thermal cell absorber= Energy out of thermal cell absorber

$$S_{R2}\tau_g\alpha_p = \dot{Q}_{rad,TCA2} + \dot{Q}_{conv,TCA2} + \dot{Q}_{cond,TC} \quad (4)$$

Energy balance for base absorber,
Energy in to the base absorber = Energy out of base absorber

$$S_{R2}\tau_g\alpha_p + \dot{Q}_{rad,ABA3} + \dot{Q}_{conv,ABA3} = \dot{Q}_{rad,ABA2} + \dot{Q}_{conv,ABA2} + \dot{Q}_{cond,AB} \quad (5)$$

Energy balance for dummy load,
Energy in to the dummy load = Energy out of dummy load

$$\dot{Q}dummy = \dot{Q}_{rad,DLA3} + \dot{Q}_{conv,DLA3} + \dot{Q}_{cond,DL} \quad (6)$$

Energy balance for bottom,
Energy in to the bottom = Energy out of bottom

$$U_b = \dot{Q}_{rad,Ba} + \dot{Q}_{conv,Ba} \quad (7)$$

$$Ut = \dot{Q}_{rad,g1s} + \dot{Q}_{conv,g1s} \quad (8)$$

$$UTotal = Ut + Ub + Ue \quad (9)$$

3. Results and Discussion

The mathematical modelling was conducted during peak solar irradiance conditions (860.034 W/m²) over a 60-minute evaluation period. Through iterative computational methods, the system's heat input (Q_{in}) and output (Q_{out}) were compared until an energy balance with <5% deviation was achieved. As presented in Table 2, the residual errors across FPBTCA components demonstrate satisfactory convergence:

- Glass Cover 1: 4.81%
- Glass Cover 2: 2.51%
- Thermal Cell: 3.98%
- Absorber Base-Collector: 3.67%

The analysis confirms that the thermal cell's energy equilibrium critically governs FPBTCA performance. Notably, the heat input exhibits a positive correlation with incident solar radiation intensity, as theoretically expected.

Table 2. Error between Q_{in} and Q_{out}

Solar collector component	Q_{in} (J)	Q_{out}(J)	Error (%)
Glass Cover 1	106.90	101.75	4.81
Glass Cover 2	112.58	109.75	2.51
Thermal Cell	446.25	428.47	3.98
Absorber base collector	1522.01	1466.14	3.67

Figure 6 illustrates the relative performance efficiencies of the thermal cell-enhanced collector FPBTCA and baseline FPSC across different time intervals and solar radiation conditions. Key observations include:

i. FPBTCA achieves superior peak efficiency (30.24% at 360 minutes) compared to FPSC (21.81%)
ii. FPBTCA demonstrates more stable efficiency during periods of declining solar radiation (120-180 minutes)
iii. Both systems show positive correlation between solar irradiance and efficiency
iv. Field performance data confirms FPBTCA's overall operational advantage

Design Optimization Considerations:

The FPBTCA's enhanced performance stems from its unique thermal cell absorber design, where:

i. Critical design parameters:
   - Optimal thickness of cell absorber
   - Appropriate mass configuration
   - System dimensional constraints (T. T. Chow, 2006)

ii. Performance relationships:
   - Increased absorber thickness/mass improves radiation absorption
   - Enhanced heat retention capacity boosts thermal performance

- Excessive mass may cause undesirable temperature drops (C. D. Ho, 2021)

iii.System implications:

- Thermal cell directly influences base plate temperature
- Design parameters affect drying chamber performance
- Requires careful balance between absorption and heat retention

The analysis demonstrates that proper sizing of the thermal cell absorber is crucial for maintaining optimal operating temperatures throughout the system while maximizing solar energy utilization.

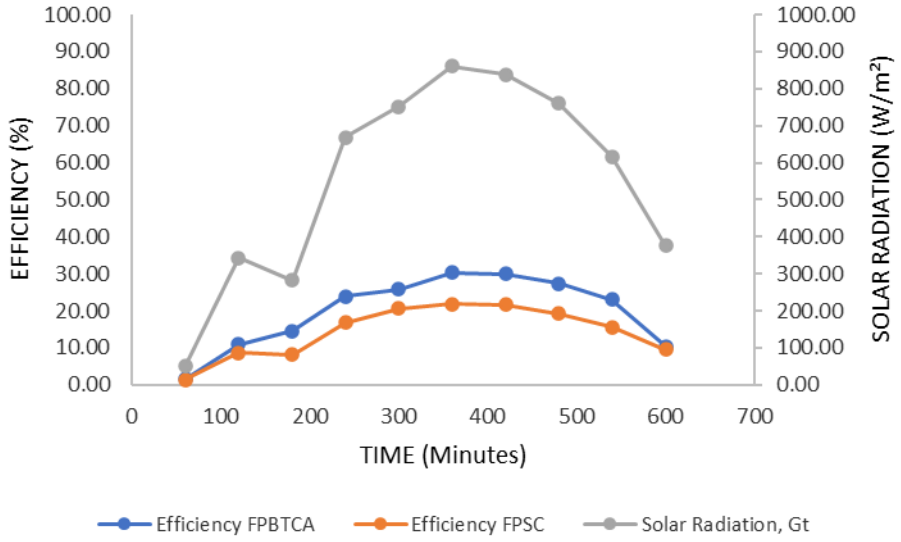

Fig. 6. Efficiency (%) for FPBTCA and FPSC

The fundamental principle of heat conduction in solar collectors involves thermal energy transfer between surfaces at different temperatures through direct molecular interaction. This process occurs spontaneously from higher to lower temperature regions until thermal equilibrium is established. Key factors governing conduction rates include material thermal properties, temperature gradient magnitude and effective contact surface area. Figure 7 depicts the Heat conduction, Q (J) for FPBTCA and FPSC. Performance analysis reveals that FPBTCA achieves superior heat conduction (2424.91 J at 360 min). FPSC also demonstrates lower conduction values (1749.06 J at the same interval). Both systems show peak performance coinciding with maximum solar radiation exposure. The comparative data clearly indicates FPBTCA's enhanced thermal transfer capability under identical operating conditions. This performance advantage stems from the system's optimized design parameters that facilitate more efficient energy transmission through the collector assembly.

There is a 675.85 J difference in heat conduction between FPBTCA and FPSC. The situation arises when solar radiation is 860.03 W/m^2, an elevated level. Collector efficiency in both configurations is fundamentally governed by the solar energy absorption capacity of their absorbed components. Reduced sun radiation also results in reduced heat conduction for FPBTCA and FPSC. Additionally, FPBTCA exhibits a higher level of continuous heat conduction compared to FPSC. The absorber base receives heat energy previously stored in the cell absorber. When sunlight diminishes, the thermal cell redirects its stored energy for absorption processes, subsequently channeling this heat to the drying chamber. Thermal energy storage capability allows the absorber cell to compensate for intermittent solar availability during cloudy conditions. When solar radiation diminishes, such as during cloudy conditions or nighttime, the solar thermal absorber remains crucial. It is during these periods that the stored heat energy within the absorber material becomes exceptionally valuable.

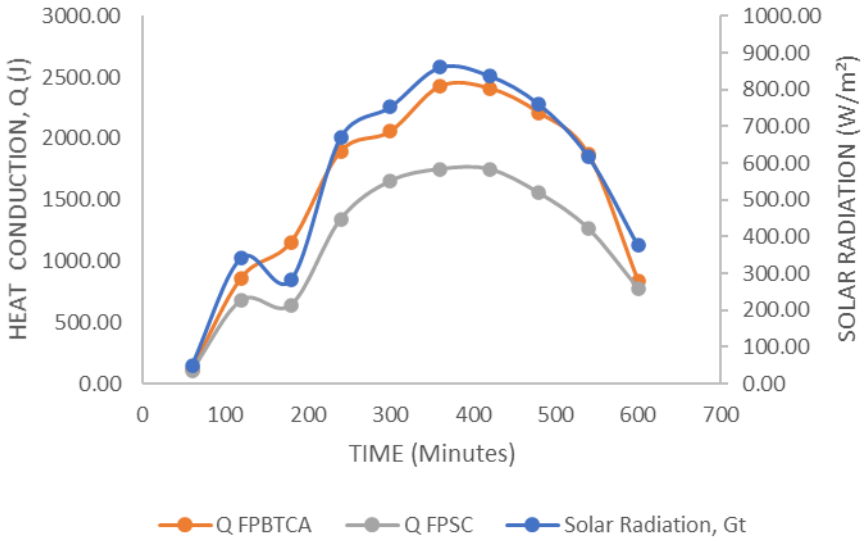

Fig. 7. Heat conduction, Q (J) for FPBTCA and FPSC.

4. Conclusion

Field testing under natural sunlight conditions yielded comparative performance data for different thermal absorber collector designs, with the following several conclusions, such as design modelling, performance comparison, and thermal performance characteristics. The model validation aspect shows that the developed mathematical model, based on comprehensive heat transfer analysis, successfully established FPBTCA's energy balance. Development of the FPBTCA mathematical model involved a comprehensive heat transfer evaluation to establish system energy equilibrium. The model indicated that the discrepancy between Q_{in} and Q_{out} is less than 5%, demonstrating that the energy balance equation effectively correlates Qin and Q_{out} for FPBTCA.

Comparative analysis between FPBTCA and FPSC demonstrated superior efficiency of the FPBTCA system. The performance advantage was particularly evident at the 360-minute mark, where FPBTCA showed significantly better energy conversion. Based on the peak solar radiation (860.03 W/m²), FPBTCA exhibited 675.85 J greater heat conduction than FPSC. This performance differential highlights the critical role of thermal cell absorber thickness, mass configuration and Optimal design parameters. While increased thickness and mass improves efficiency and heat conduction, designers must balance these factors against potential temperature reduction in the drying chamber and the overall system thermal dynamics. The findings emphasize the importance of careful thermal cell dimensioning in FPBTCA systems to maximize performance while maintaining operational stability. This research provides valuable insights for optimizing solar thermal collector designs in practical applications.

Abstract

This research focuses on the development of an innovative and interactive educational kit specifically designed to enhance students' understanding of concepts and applications in the fields of Programmable Logic Controllers (PLC) and the Internet of Things (IoT). The kit is equipped with key PLC components such as a conveyor system that functions as an automatic movement mechanism simulating industrial processes and a tower light feature that indicates the system's operational status. On the IoT side, the kit integrates six types of sensors: humidity, temperature, water quality, ultrasonic, soil moisture and smoke sensors. It also includes wireless communication capabilities enabling data transmission to a smartphone via the Blynk application allowing students to monitor sensor readings in real time. Through practical exposure students can understand the basic operation of each sensor and subsequently apply this knowledge in developing real-world projects that simulate actual industrial scenarios. This approach better prepares students to face real-world challenges in automation and IoT-related job sectors. Overall, the educational kit serves as a comprehensive and high-impact learning platform, designed to bridge the gap between theoretical knowledge and practical implementation while fostering a culture of innovation and technical skill development among TVET students.
Keywords: Educational kit; Programmable logic controller; Internet of Things.

1. Introduction

In today's rapidly evolving industrial era, the integration of automation and the Internet of Things (IoT) has become a crucial driver of Industry 4.0. This shift demands a workforce that is not only knowledgeable in technical theory but also proficient in hands-on applications using real industrial tools (Abdulaziz et al., 2023; Zhou et al., 2023). However, a persistent challenge in Technical and Vocational Education and Training (TVET) is the disconnect between classroom theory and real-world practices. Many students struggle to apply concepts learned in lectures to practical environments due to limited access to industry-relevant equipment (Lee & Tan, 2022; Triatmaja et al., 2024).

The Malaysian Education Blueprint (Higher Education) 2015–2025 emphasizes the importance of equipping graduates with holistic skills and entrepreneurial mindsets through Shift 1 and calls for TVET transformation under Shift 4 (Ministry of Education Malaysia, 2015). This national direction highlights the need for competency-based and practical-oriented training that aligns with global technological demands (Hanafi et al., 2023; Salleh & Halim, 2023). In this context, integrating PLC and IoT technologies in teaching modules is essential to producing industry-ready graduates who can thrive in smart manufacturing environments.
To address this educational gap, the educational kit is developed. This interactive educational kit allows students to be directly involved with programmable logic controllers (PLCs) and IoT components in a structured and guided learning environment. Unlike conventional simulation-only approaches, the kit emphasizes real-time data monitoring, sensor-based input/output control, and cloud-based communication capabilities reflective of real-world industrial setups (Badshah et al., 2023; Cheong & Li, 2022).

Furthermore, previous studies show that experiential and problem-based learning, especially when involving actual industrial tools, significantly improves students' motivation, understanding and retention of technical skills (Tri Atmaja et al., 2024; Hussain et al., 2023). This trainer also supports hybrid or blended learning environments, enabling students to explore automation both in physical labs and remotely (Khairuddin et al., 2020; Chang et al., 2024). In conclusion, the educational kit is not merely an instructional tool; it represents a scalable solution aligned with national education reforms and IR 4.0 requirements. It empowers students through authentic, hands-on learning experiences and strengthens Malaysia's agenda of producing technically skilled, innovative, and industry-responsive graduates.

2. Methodology

These educational kits were developed as reference materials and instructional aids for lecturers during the teaching and learning process with students. In developing the system, several important aspects needed to be considered, including the workflow, circuit design, printed circuit board (PCB) layout, source materials, implementation, testing, and subsequent improvements. This study employed a developmental research design, structured into three sequential phases of design, development and evaluation.

The initial phase of the project began with an in-depth literature review and curriculum analysis to identify the educational needs related to PLC and IoT applications. Based on these findings, a prototype training kit was developed, featuring the integration of a conveyor system and a tower light to simulate real-world industrial PLC operations. To support IoT functionalities, six types of sensors which are temperature, humidity, soil moisture, water quality, ultrasonic and smoke were installed (Figure 1). An ESP32 microcontroller was programmed to interface with these sensors, enabling real-time data collection and processing. In addition, an IoT-based monitoring dashboard was developed using the Blynk platform, providing wireless and real-time visualization of sensor data on a mobile device.

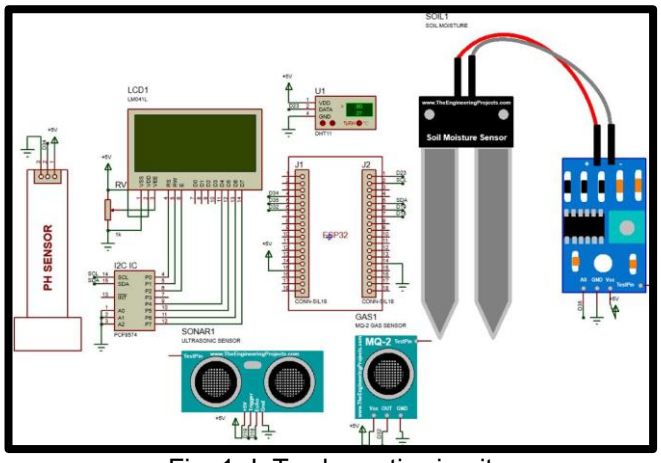

Fig. 1. IoT schematic circuit

In the automation section, the circuit includes connections between the PLC and key components such as the conveyor and tower light. The PLC is programmed to control the motor that drives the conveyor, while the tower light provides a visual indication of the system's operational status. Inputs to the PLC are also connected to switches and an obstacle detector, namely the proximity sensor, which functions to detect the presence of objects on the conveyor. The entire circuit in Proteus was designed with attention to logical connections and appropriate voltage requirements. Simulations were carried out to ensure that each component functioned as intended before physical implementation on an actual circuit board. This design not only illustrates the relationships between components but also plays a crucial

role in testing and validating the system's operation virtually before the actual prototype is built. Once the schematic circuit design of the educational kit was confirmed to function properly through simulation in the Proteus software, the next step was to develop the printed circuit board (PCB) layout (Figures 2 and 3). This process is essential to produce a neat, compact, and easy-to-assemble and maintain board design.

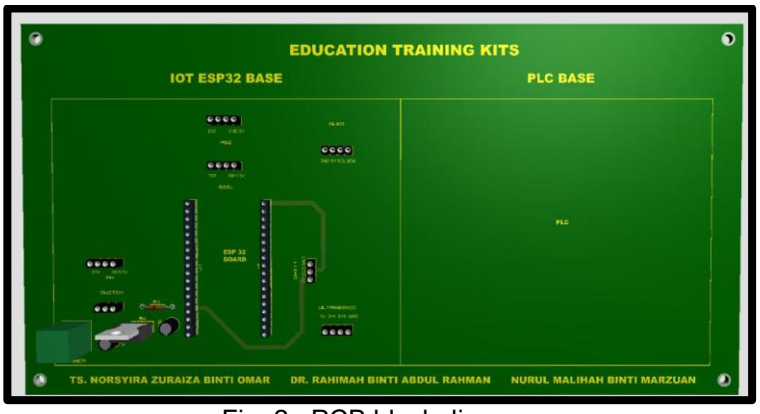

Fig. 2. PCB block diagram

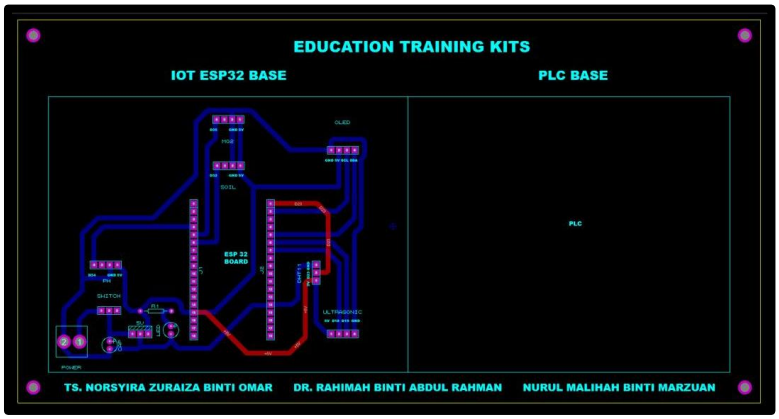

Fig. 3. PCB layout

The kit was evaluated for its technical operation by testing the functionality, integration and real-time performance of the PLC and IoT components including sensors, automation responses and wireless data transmission. The prototype was pilot tested with students from two courses, Final Year Project and PLC. The evaluation involved quantitative methods with data collected using structured usability questionnaires that focused on students' understanding, ease of use and the perceived educational value of the kit. All data collected were analysed descriptively to assess the kit's effectiveness and to inform design improvements for broader educational implementation.

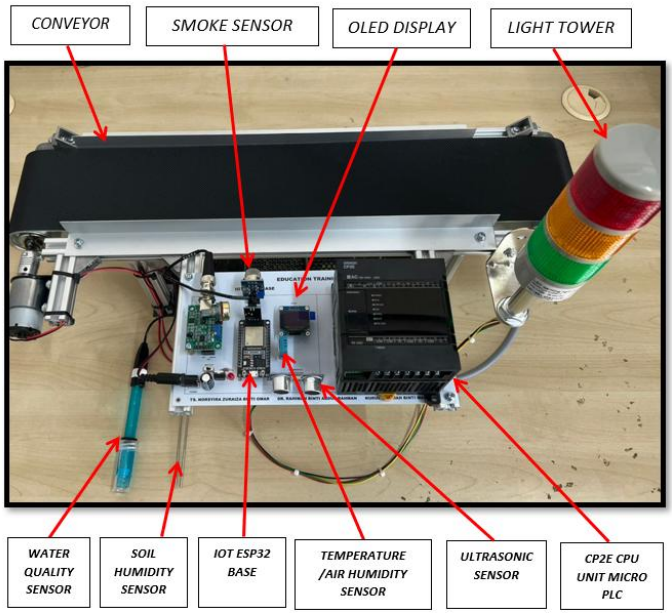

Fig. 4. Complete design of the educational kit

Figure 4 illustrates the complete design of the educational kit, which is ready to be used as a teaching aid for related topics. The kit integrates a basic automation system, including a conveyor and tower light, along with six types of IoT sensors and real-time communication via the Blynk application. The operation of this educational kit begins with connecting the kit to a stable DC power supply, such as a 12V adapter. Proper connection to both the printed circuit board (PCB) and the ESP32 microcontroller is essential to prevent damage to the components. The kit features two primary modes of operation, with PLC mode and IoT mode as shown in the flow chart in Figure 5 below. In PLC mode, the system operates the conveyor and tower light using programmed ladder logic. In IoT mode, the ESP32 microcontroller is used to read data from six types of sensors (temperature, ultrasonic (distance), water quality, smoke, air humidity, and soil moisture) and transmit this data in real time via Wi-Fi to a smartphone using the Blynk application. These modes can be used independently or simultaneously, depending on the instructional objectives.

For the PLC module, students are required to develop ladder diagrams using CX-Programmer software. Input signals from connected sensors are routed to the digital input terminals of the PLC, while the output terminals are linked to relays that control the motorized conveyor and tower light based on the programmed logic. Meanwhile, the IoT module involves the ESP32 microcontroller programmed via the Arduino IDE to interface with the sensors. The collected sensor data is transmitted wirelessly to the Blynk application and can also be viewed on an integrated OLED display (Figure 6). This setup allows real-time monitoring of environmental conditions through both mobile and onboard interfaces. Finally, the Blynk application displays the sensor readings in Figure 4 in both digital and graphical formats, enabling students to interact with the system and observe live data representations thereby enhancing their learning experience in automation and IoT applications.

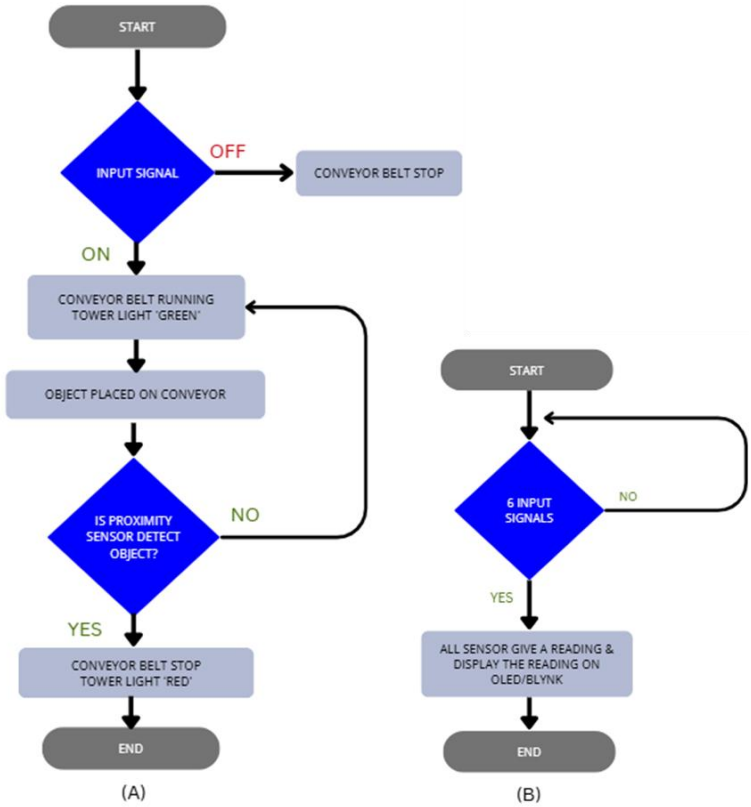

Fig. 5. Flow Chart (A) PLC Part; (B) IOT Part

3. Results and Discussion

This section presents the outcomes and the evaluation through simulation and practical testing. The results are discussed based on the technical performance of both the PLC and IoT components, focusing on the functionality, integration, and real-time monitoring capabilities. Additionally, user feedback from pilot testing with students is analyzed to assess usability, learning impact, and areas for further refinement.

Table 2. Sensor reading range specification

No.	Sensor Type	Parameter Measured	Typical Model	Measurement Range	Unit	Notes
1	Soil Moisture Sensor	Soil water content	Capacitive / YL-69	0 (dry) – 1023 (wet)	Analog value	Output is analog; requires calibration to convert to % moisture
2	Humidity Sensor	Relative humidity	DHT11 / DHT22	DHT11: 20–90% DHT22: 0–100%	%RH	Accuracy ±5% (DHT11), ±2% (DHT22); works with digital I/O
3	Ultrasonic Sensor	Distance / Water Level	HC-SR04	2 cm – 400 cm	cm	Accuracy ±0.3 cm; used for measuring tank or soil surface distance
4	MQ2 Gas Sensor	Gas concentration (LPG, Smoke, Methane)	MQ-2	200 – 10,000 ppm	ppm	Analog output; needs calibration for specific gases

5	pH Sensor	Acidity / Alkalinity	Analog pH sensor (e.g., SEN0161)	pH 0 – 14	pH units	Accuracy ±0.1 – 0.3 pH; analog output; needs buffer calibration
6	Temperature Sensor	Ambient temperature	DHT11 / DHT22	DHT11: 0–50°C DHT22: -40–80°C	°C	Accuracy ±2°C (DHT11), ±0.5°C (DHT22)

The Blynk application, shown in Figure 6, visualizes sensor data in both digital and graphical formats, allowing students to interact with live data streams. This interactive setup enhances students' understanding of automation systems, data acquisition, and IoT integration by bridging theoretical concepts with practical applications. As a result, it serves as a comprehensive learning platform that strengthens competencies in programmable logic control, sensor interfacing, and real-time IoT communication.

Fig. 6. OLED and Blynk Application Display

Students were allowed to modify the PLC program or ESP32 code to test various operational scenarios and logic configurations. Observations were made on how these changes affected the automation system and the data display on the Blynk application. The development of the educational kit has had a comprehensive impact on various stakeholders within the TVET education ecosystem, including institutions, educators, students, and the overall education system. From the institutional perspective, this project enhances the image and reputation of the institution as a leader in technical education innovation while supporting the goal of offering industry-relevant programs. This aligns with the objectives of the National TVET Policy, which emphasizes strengthening strategic collaboration between TVET institutions and industries to produce a highly skilled workforce. The project also serves as a catalyst for integrating technology into teaching and learning, particularly in the areas of automation and the Internet of Things (IoT).

For educators, the educational kit empowers teaching approaches by incorporating practical, industry-based technologies, while also creating opportunities for research and the development of innovative teaching aids. For students, it provides direct exposure to technical skills and industrial equipment, thereby enhancing employability, self-confidence, and competitiveness in the job market. The incorporation of project-based learning also fosters the development of soft skills such as problem-solving, teamwork, and communication. From a broader educational perspective, this project contributes to the transformation of TVET education towards a more responsive, digital, and Industry 4.0-aligned system. It supports the aspirations of the National TVET Policy by expanding access to quality education, improving learning facilities, and strengthening the development of relevant and adaptive curricula. In addition, this initiative aligns with several Sustainable Development Goals (SDGs), including SDG 4: Quality Education, and SDG 8: Decent Work and Economic Growth, by providing comprehensive and high-impact skills training. Overall, the educational kit represents a holistic educational innovation that supports national policy goals and strengthens the TVET ecosystem towards a more sustainable and competitive future.

A survey study was conducted involving 52 fourth-semester students to evaluate the effectiveness of using the educational kit in the teaching and learning (T&L) process. The questionnaire consisted of 15 items covering aspects such as technical understanding, kit design, the effectiveness of practical T&L, as well as interest and confidence in the fields of automation and IoT. A 5-point Likert scale was used: 5 (Strongly Agree), 4 (Agree), 3 (Neutral), 2 (Disagree), and 1 (Strongly Disagree). In addition, open-ended subjective questions were included to gather users' opinions and perspectives.

Table 2. Educational kit user feedback

NO	ITEM	Feedback Score Percentage (%)		
	Scale	3	4	5
1	*Saya memahami fungsi asas sensor selepas menggunakan kit ini.*	9.6	7.7	82.7
2	*Saya dapat melihat hubungan antara sensor dan sistem automasi sebenar.*	5.8	13.5	80.8
3	*Penggunaan PLC dalam kit ini membantu saya memahami logik kendalian industri.*	9.6	17.3	71.2
4	*Saya dapat mengenal pasti jenis sensor yang sesuai untuk aplikasi tertentu.*	9.6	17.3	73.1
5	*Integrasi IoT membantu saya memahami konsep pemantauan jarak jauh.*	7.7	23.1	69.2
6	*Reka bentuk kit ini menarik dan mesra pengguna.*	7.7	11.5	80.8
7	*Aktiviti praktikal yang dijalankan menggunakan kit ini memudahkan pembelajaran.*	7.7	13.5	78.8
8	*Saya dapat mengendalikan kit ini dengan bimbingan yang minimum.*	19.2	21.2	59.6
9	*Edukit ini membantu saya menjana idea untuk projek akhir tahun (FYP).*	11.5	13.5	75
10	*Tenaga pengajar memberi panduan yang jelas semasa sesi praktikal.*	7.7	9.6	82.7
11	*Latihan menggunakan kit ini lebih menarik berbanding pembelajaran teori semata-mata.*	5.8	13.5	80.8
12	*Saya lebih yakin dengan kemahiran teknikal saya selepas sesi latihan menggunakan kit ini.*	7.7	15.4	76.9
13	*Kit ini memberi saya gambaran jelas tentang keperluan industri 4.0.*	9.6	13.5	76.9
14	*Saya lebih berminat untuk mendalami bidang automasi dan IoT selepas menggunakan kit ini.*	7.7	19.2	73.1
15	*Edukit ini meningkatkan keyakinan saya untuk bekerja dalam bidang kejuruteraan elektrik/elektronik.*	9.6	11.5	78.8

Findings from the survey revealed that the effectiveness of the educational kit can be summarized into four main dimensions:

1. Understanding of Basic Concepts and Technological Applications

Items related to sensor functionality and its application in real-world automation systems (Items 1 and 2) recorded the highest agreement at scale 5, with 82.7% and 80.8% respectively. This suggests that the kit effectively enhances students' conceptual understanding. The use of PLCs and appropriate sensor selection (Items 3 and 4) also showed strong results, with over 70% rating them at scale 5. However, nearly 27% of responses fell within scale 3 and 4, indicating a need to reinforce students' grasp of industrial applications further. In terms of IoT fundamentals and relevance to Industry 4.0 (Items 5 and 13), more than 69% rated at scale 5, yet the presence of 30.8% in the neutral and agree categories suggests that additional exposure and context around these technologies could further enhance comprehension.

2. Kit Design and Usability

Students generally responded positively to the design of the kit, with 80.8% strongly agreeing that the kit is user-friendly (Item 6). However, only 59.6% felt confident operating the kit independently with minimal guidance (Item 8), highlighting the potential need for improvements in user manuals, interface design, or hands-on training support.

3. Impact on the Learning Process

The Educational Kit also had a significant positive impact on the teaching and learning process. Most students expressed satisfaction with the practical activities provided (Item 7 – 78.8%) and the overall teaching approach (Item 10 – 82.7%). Furthermore, 80.8% agreed that learning through this kit was more engaging compared to conventional theory-based instruction (Item 11). Notably, 75% of respondents acknowledged that the Educational Kit helped spark ideas for their Final Year Project (Item 9), reflecting its ability to promote creative and applied thinking.

4. Enhancement of Interest and Confidence

The Educational Kit contributed to increase student confidence in technical skills (Item 12 – 76.9%) and heightened interest in the fields of automation and IoT (Item 14 – 73.1%). Importantly, 78.8% of respondents reported that they felt more prepared and confident to work in the electrical or electronics field after using the kit (Item 15), demonstrating the Educational Kit's effectiveness as a tool for career readiness and motivation in the TVET context.

4. Conclusion

The development and implementation of the educational kit marks a significant advancement in bridging the gap between theoretical learning and practical application within the TVET context. By integrating core automation components such as PLC-controlled conveyor systems and tower lights with IoT-enabled sensor technologies, the kit provides students with an immersive, hands-on learning experience reflective of real industrial environments. The kit’s dual-mode operation, encompassing both PLC programming and real-time IoT monitoring, enables students to grasp the interdisciplinary nature of modern smart systems.

Evaluation results from pilot testing indicate a strong positive response from students in terms of usability, conceptual understanding, and increased confidence in technical skills. Furthermore, the educational kit aligns with national TVET policies and the broader goals of Industry 4.0 and Sustainable Development Goals (SDGs), especially in promoting quality education and decent work opportunities. It not only enhances student readiness for the workforce but also empowers educators with a flexible, impactful teaching tool.

For future enhancements, improvements could include the addition of wireless communication modules and the expansion of the monitoring dashboard to cater to larger-scale projects. These upgrades would further increase the kit’s relevance and scalability in more advanced educational and industrial settings. In essence, this educational kit serves as a scalable and sustainable educational innovation that supports the transformation of technical education. It fosters a learning ecosystem that is practical, industry-relevant, and capable of cultivating a generation of skilled, innovative, and future-ready graduates.

DESIGN OF IOT GARBAGE MONITORING WITH WEIGHT SENSING

Anira Abdul Rashid*, Noor Akmalun Nisa' Man

Electrical Engineering Department, Seberang Perai Polytechnic, 13500 Permatang Pauh, Penang, Malaysia

*Corresponding author e-mail address: anira@psp.edu.my

Abstract

Efficient management of urban waste has always been a challenging task, requiring continuous efforts from ground-level personnel to empty garbage bins as they reach capacity. The unpredictable nature of garbage accumulation, varying widely in timing and volume, complicates this process. The "IoT Garbage Monitoring with Weight Sensing" project represents a significant innovation aimed at enhancing efficiency in waste management. This system monitors the fill-level of garbage bins and transmits real-time data via a web interface. Utilizing ultrasonic sensors mounted on the bins, it accurately measures and compares garbage levels against predefined thresholds. Additionally, weight sensors beneath the bins provide precise data on the amount of collected waste. This combined sensing approach enables authorities to monitor both fill levels and accumulated weights remotely. When a bin reaches its capacity, the system triggers alerts, facilitating timely waste collection by notifying disposal vehicles. The hardware components include an AVR family microcontroller, an LCD screen for local display, a Wi-Fi modem for data transmission, and a buzzer to signal alerts.
Keywords: Wi-Fi modem; Load cell; Ultrasonic sensor.

1. Introduction

The Internet of Things (IoT) refers to a network of interconnected physical objects (Jamil et al., 2022) capable of interacting and sharing data autonomously, without requiring human intervention. It is formally recognized as an "Information Society Infrastructure," enabling the collection of data from various entities such as humans, animals, vehicles, and household appliances. By equipping these objects with electronic hardware like sensors, software, and networking equipment, any physical entity with an IP address can be integrated into the IoT ecosystem for data transmission over networks. Unlike traditional Internet usage, IoT extends connectivity to everyday objects embedded with circuits, allowing them to interact and communicate via existing Internet infrastructure.

Since its inception, the scope of IoT has expanded significantly (Kumar & Rana, 2024), currently encompassing over 12 billion connected devices, with projections indicating this number could reach 50 billion by 2020. IoT has proven beneficial for both manufacturers and consumers alike. Manufacturers gain valuable insights into product usage and performance in real-world scenarios, enabling them to offer value-added services that enhance product lifecycles. Meanwhile, consumers benefit from the ability to integrate and control multiple devices, providing a more personalized and enhanced user experience.

IoT-enabled garbage monitoring utilizing weight sensing employs an ATmega microcontroller (Islam et al., 2020) with an LCD display, rechargeable battery, and solar panel powered by a 12V supply. The system integrates two types of sensors: a weight cell sensor and ultrasonic sensor, which measure weight and garbage levels respectively. Ultrasonic sensors monitor various levels of garbage in bins, triggering weight sensors to transmit data when thresholds are reached. The microcontroller processes this data and transmits it to a Wi-Fi module for communication. A mobile handset connected to the Wi-Fi router receives and displays garbage bin information in a web browser using an HTML interface.

In the current system, municipal staff collect garbage from empty bins daily. However, in public places, bins often overflow due to increasing waste accumulation. This overflow leads to garbage spillage and unpleasant odors, contributing to air pollution and potential health risks. Locating bins can be challenging, particularly for new drivers, prompting the introduction of GPS technology to aid in bin location and maintenance. Drawbacks of the existing system include heavy reliance on human resources (Hassan & Yusof, 2025), manual operation, high operational costs, odour emission causing health concerns, and the overall unhygienic appearance of the city.

The proposed system emphasizes efficient waste collection (Pathak & Shelar, 2021) by automating the process, thereby saving time. It continuously monitors the status of bins and sends notifications to designated authorities via an Android application. The advantages of this system include: i) Real-time monitoring of dustbins; ii) Intelligent service management; iii) Enhanced environmental quality; iv) Cost-effectiveness and urban improvement.

2. Methodology

This project proposes a real-time smart garbage monitoring system that is both simple and efficient. The system is designed to continuously track the status of garbage bins using a microcontroller-based approach. The key components of the system are as follows:

- ATmega328 Microcontroller:
  Serves as the central processing unit, managing all sensor inputs and coordinating data flow in the system.
- Ultrasonic Sensors:
  Four ultrasonic sensors are used, each assigned to a garbage bin to measure the fill level by detecting the distance from the sensor to the waste surface.
- Weight Sensor Module:
  A load cell-based weight sensor is integrated to measure the weight of the garbage in each bin, providing an additional metric for monitoring bin status.
- LCD Display:
  A display screen is included to show real-time data on garbage levels and weights locally.
- Wi-Fi Module:
  Enables wireless transmission of collected data to a designated website or IoT platform, allowing remote monitoring and data logging.

The ATmega328 Controller is an open-source board based on the Arduino cc ATmega328 microchip controller. It is equipped with sets of digital and analog input/output (I/O) pins that can be interfaced with various boards (shields) for expansion and other circuits. The board features 14 digital pins and six analog pins and is programmable via a Type B USB cable using the Arduino IDE (Integrated Development Environment). It can be powered either by a USB cable or an external 9-volt battery, accepting voltages between 7 and 20 volts. It is like the Arduino Nano and Leonardo. Distributed under a Creative Commons Attribution Share-Alike 2.5 license, the hardware reference design is available on the Arduino website. The ATmega328 comes pre-programmed with a bootloader that enables new code to be uploaded without needing an external hardware programmer.

A load cell is defined as a "weight measuring system needed for electronic scales that display weights." However, a load cell is not limited to weight measurement in electronic scales. It is a passive transducer or sensor that converts force into electrical signals and is also known as a "load transducer." The most predominant load cells are those based on strain gauges. The widespread adoption of strain gauge-based load cells is due to their small size compared to

other types, long operating life due to the lack of moving parts or other types, long operating life due to the lack of repetition of moving parts or other friction-causing components, and ease of production because of the small number of components.

The Weight Sensor Module is based on the HX711, a 24-bit analog-to-digital precision converter designed to interface directly with a bridge sensor for weight scale and industrial control applications. The HX711 not only offers simplicity compared to other chips, but it also features high integration, rapid response, and immunity to interference. This chip lowers the costs of electronic scales while simultaneously improving performance and reliability.

The ESP8266 Wi-Fi Module is a self-contained System-on-Chip (SoC) with a built-in TCP/IP protocol stack that can provide connectivity to a Wi-Fi network for microcontrollers. The ESP8266 can either host an application or offload all Wi-Fi networking functions from another device's processor. This low-cost module enables manufacturers to make microcontroller-based devices wirelessly networkable. The ESP8266 operates in the 2.4GHz range and utilizes a 32-bit RISC CPU running at 80MHz. It is based on TCP/IP (Transmission Control Protocol) and is a critical component for IoT operations. The ESP8266 features 64KB of ROM boot memory, 64KB of instruction RAM, and 96KB of data RAM. It performs IoT operations by sending data from an energy meter to a website accessible via an IP address. The module's TX and RX pins connect to the Arduino microcontroller's pins 7 and 8.

The Ultrasonic Sensor HC-SR04 uses sonar to measure the distance to an object. This provides excellent non-contact range detection with high precision and reliable readings, making it an easy-to-use kit. The sensor includes an ultrasonic transmitter and receiver. By measuring the time between the signal being transmitted and received, the sensor can accurately determine the distance to an object. The term LCD stands for Liquid Crystal Display. It is a type of electronic display module used in a wide range of applications, including cell phones, calculators, computers, television sets, and more. These displays are often chosen over light-emitting diodes and seven-segment displays in multi-segment configurations due to their advantages.

The main benefits of using an LCD module include its low cost, ease of programming, ability to display custom characters, special symbols, and even animations. A typical 16x2 LCD has two registers: the data register and the command register. The RS (Register Select) pin is used to switch between these registers. When the RS is set to '0,' it is in command mode; when set to '1,' it is in data mode. The solar panel is rated at 6V and 5W, which can recharge a 3.7V battery. A flowchart (Figure 2) illustrating the operational sequence of the proposed system to ensure accurate results.

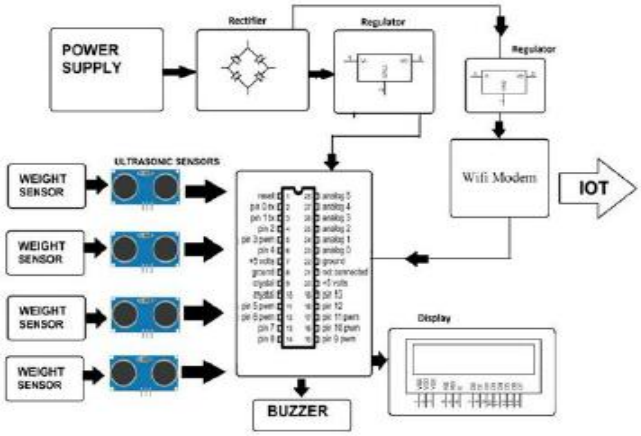

Fig. 1. Block diagram

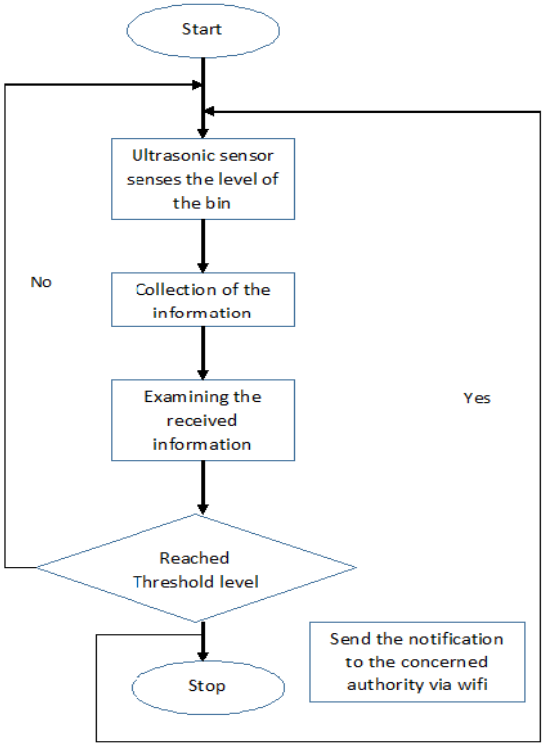

Fig. 2. Flowchart

At system start-up, the Wi-Fi module is initialized (Raj & Paul, 2020) and automatically connects to a pre-programmed SSID and password, which must be set by the user according to their router or mobile hotspot credentials. Once the connection is established, the system performs an initial scan to measure and record the height of all garbage bins.

After recording the bin heights, the system enters the active monitoring phase. During this phase, it continuously checks the garbage fill level and weight. To ensure data accuracy and reliability, the Wi-Fi connection is re-established before each monitoring cycle. This allows the system to upload the latest data to the designated website in real time. All collected data is accessible online, enabling relevant personnel—such as municipal officers—to monitor the garbage levels remotely from any location. For alert functionality, the system includes a buzzer and an LED indicator. When any garbage bin reaches its maximum capacity, the buzzer is triggered and the LED turns on. The buzzer continues to sound until the bin is emptied or the garbage level drops below the threshold.

3. Results and Discussion

The system testing involved analyzing four main garbage bin conditions: empty, half-filled, full, and heavy. Each condition was validated using a combination of ultrasonic sensors (Verma et al., 2020) and weight measurement. For the 'empty' condition, the system accurately detected 0% garbage fill, as verified by the baseline readings of the ultrasonic sensor (Verma et al., 2020). In the 'half-filled' state, garbage bins triggered alerts after reaching approximately 50% fill capacity, confirmed through both sensor values and visual inspection. When bins reached 90% capacity, the system initiated full-alert triggers. The sensors provided consistent readings, and the buzzer system was successfully activated in all tests. The 'heavy' bin scenario involved loads exceeding the predefined weight threshold (Alaa et al., 2023). This activated the weight-sensing module, which accurately measured overloads and triggered additional alerts (Alaa et al., 2023). In all test cases, real-time data was successfully transmitted to the online platform, allowing for remote status monitoring. These outcomes support the system's reliability and validate its potential for practical waste management deployment.

The system determines the garbage bin status using a combination of IR level sensors and a weight sensor. The conditions for various bin statuses are defined as follows:

a. Empty Bin: 0% fill level (triggered by the first IR sensor)
b. Half-Filled Bin: 50% fill level (triggered by the first and second IR sensors)
c. Full Bin: 90% fill level (all three sensors activated)
d. Heavy Bin: Threshold weight exceeded (triggered by weight sensor)

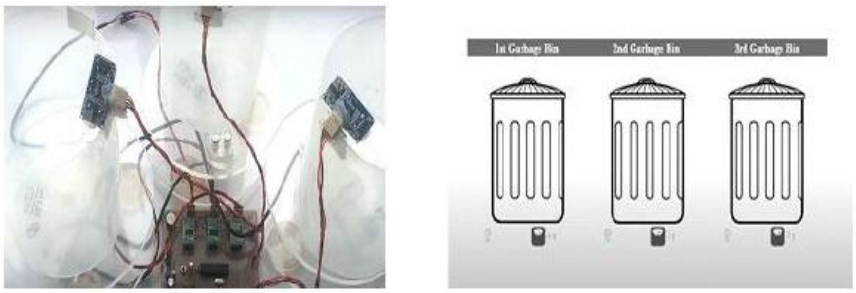

Fig.3. Empty dustbin

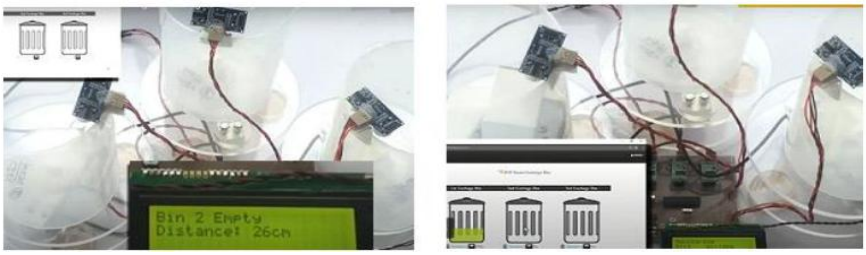

Fig.4. Half-filled dustbin (50%)

Fig. 5. Full dustbin (90%)

Fig. 6. Heavy dustbin

4. Conclusion

This project implements a smart garbage monitoring system using ultrasonic sensors, a weight sensor, a microcontroller, and Wi-Fi connectivity. The system ensures that each dustbin is monitored in real-time, triggering alerts when the garbage level reaches its threshold. This enables timely cleaning of bins and prevents overflow. If a dustbin is not emptied within a predefined time, the system logs the incident and forwards the record to higher authorities. This feature promotes accountability and facilitates appropriate action against responsible contractors. Additionally, it helps detect false service claims and minimizes the possibility of corruption in the waste management process. By optimizing the garbage collection schedule based on actual bin status, the system reduces the frequency of unnecessary collection trips. This results in significant cost savings on fuel and manpower while promoting a cleaner and more sustainable environment. Ultimately, this smart waste management solution enhances operational efficiency and contributes to improved urban cleanliness and hygiene.

REAL-TIME FAMILY TRACKING USING GPS TECHNOLOGY

Noor Akmalun Nisa' Man*, Roslina Saad, Anira Abdul Rashid

Electrical Engineering Department, Seberang Perai Polytechnic, 13500 Permatang Pauh, Penang, Malaysia

*Corresponding author e-mail address: akmalun@psp.edu.my

Abstract

This project presents a real-time family tracking application utilizing GPS technology, enabling users to monitor the location of their family members from anywhere. The app aims to enhance safety by providing timely updates on the whereabouts of children and loved ones, addressing growing concerns in society using the Android system. Key features include accessing data location, ensuring users are aware of tracking, and maintaining a reliable connection for accurate readings. This application serves as a valuable tool for families, fostering peace of mind and connectivity even when apart.
Keywords: Real-time tracking; GPS technology; Mobile application.

1. Introduction

The world is currently undergoing significant advancements in technology, particularly in mobile development, which has shown immense growth. Today, smartphones have become integral to daily life, influencing nearly every aspect of our existence. These devices perform a multitude of functions, including sending emails, playing games, browsing the internet for information, and accessing social networking sites such as Facebook, YouTube, and Google.

The global mobile application market is anticipated to grow at a remarkably high rate, primarily driven by the expanding smartphone market. One area of interest for many individuals in the realm of mobile technology is real-time smartphone location tracking. This trend presents opportunities for developers and programmers to pursue their interests. The emphasis is on mobile applications that utilize the Global Positioning System (GPS). GPS, which stands for "Global Positioning System," is a satellite navigation system used to determine the precise location of an object on the ground. Originally developed for military use by the United States in the 1960s, GPS technology has since expanded into civilian applications over the following decades. Today, GPS receivers are integrated into a wide range of commercial products, including automobiles, smartphones, fitness watches, and Geographic Information System (GIS) devices.

The primary purpose of this project is to enable users to view GPS map locations in real-time, like the functionality offered by the "Waze" application. The location will be updated as soon as the user changes their position. This project is specifically aimed at families, with the goal of addressing social issues among teenagers. For parents concerned about their child's safety, the utilization of this service appears attractive, as they can check that their children are 'where they are supposed to be' (Simpson B, 2014).

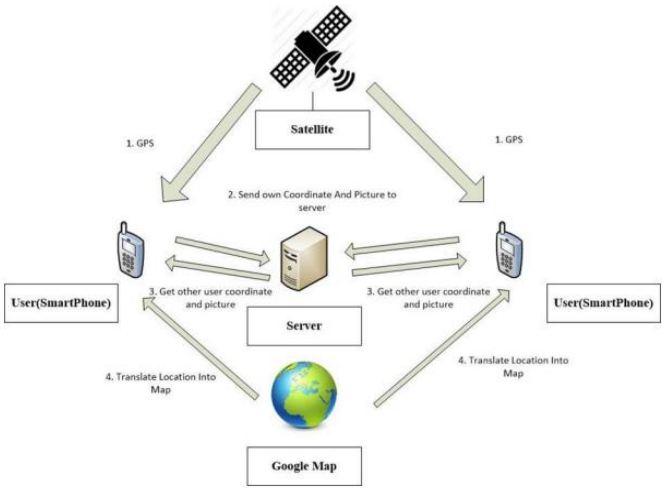

Fig. 1. System overview

Figure 1 illustrates how this system operates. The proposed project focuses on real-time family tracking through a GPS application. This application allows users to track their family members anywhere, providing peace of mind regarding the whereabouts of children or loved ones. The primary purpose of this app is to enhance safety and reduce the prevalence of concerning social phenomena in our society.

The techniques to be implemented include accessing location data, ensuring users are aware when they are being tracked, testing the application, and collecting relevant data. One of the challenges to be addressed is retrieving information at regular intervals to ensure accurate location readings. It is also essential to maintain a reliable connection between users to facilitate effective tracking. The importance of this application lies in its ability to keep loved ones safe and connected, even from a distance. To achieve this, I plan to utilize Firebase as a backend solution for real-time data synchronization and storage.

This project explores location-based applications that utilize mapping technologies, such as Glympse, GeoZilla, and Find My Friend. Each of these applications offers unique functionalities tailored to different user needs. Glympse focuses on real-time location sharing to reduce uncertainty in service deliveries, while GeoZilla caters to both family and business users by providing location tracking and safety alerts. Find My Friend specializes in GPS tracking for outdoor activities, allowing users to locate and communicate with friends in real-time.

Mobile phone tracking relies on technologies like GPS and radio signal multilateration to determine the position of a device. GPS, in particular, is widely used due to its accuracy, although it has limitations, such as high battery consumption and reduced effectiveness indoors. The applications discussed in this project utilize GPS and other location-based services (LBS) to provide users with various features, including real-time tracking, notifications, and map-based information.

The project also delves into the Android operating system, which is the foundation for developing these applications. Android offers a comprehensive software environment for mobile devices, including an application framework, an integrated browser, and support for hardware components like GPS and cameras. The development of Android apps is facilitated by Android Studio, an integrated development environment (IDE) that streamlines the coding, testing, and deployment processes.

Google Maps, a key tool in location-based applications, revolutionized online mapping with its introduction of continuous client-server interaction and extensive APIs for developers. This

has enabled the creation of sophisticated mapping applications that integrate seamlessly with Android and other mobile platforms, making it easier for developers to build powerful, location-aware applications. Based on the literature review of existing papers and journals, the technology involved in this project is still relatively new and requires a combination of different technologies to ensure its success. Google Maps plays a crucial role in this project by providing the necessary mapping capabilities, as developing a custom map would be impractical. The integration of GPS for obtaining coordinate locations with Google Maps for displaying tracking points creates an effective and efficient solution for this project.

2. Methodology

The life cycle model is a fundamental concept in systems engineering (SE). It outlines a series of stages that a system goes through, with each stage being governed by management decisions that determine when the system is ready to move from one stage to the next. For this project, the Incremental Model Life Cycle was chosen as the development approach. This model involves designing, implementing, and testing the software in increments, adding features step by step until the product is complete. It combines aspects of the traditional waterfall model with the iterative approach of prototyping, making it suitable for introducing a new system gradually and reducing the risks associated with large-scale changes. The methodology focuses on planning, requirements analysis, design, implementation, and development.

This phase involves detailed planning before proceeding to subsequent stages. During this stage, consultations with support personnel are necessary to ensure the project is on the right track. The appropriate software for the project's development is identified and set up to meet the project objectives. For this project, Android Studio was installed and configured on a Windows 7 virtual machine, with the Android SDK integrated into the environment. Proper preparation during this phase is crucial for the successful continuation of the project.

In the requirements phase, it is essential to identify and understand all the necessary requirements for developing the project. This phase involves a thorough analysis of the system's functional requirements and how they will be achieved in a step-by-step manner. The requirements phase is critical in the incremental model of software development, as it lays the foundation for the entire project. For this project, the primary requirements include the Android Studio software, which must run on a Windows-based system with a minimum of 2GB of RAM. Additionally, the Android SDK, emulator system images, and caches require at least 1GB of space. Insufficient resources can lead to slower system performance during development.

Through research and a review of previous studies, the limitations of this project have been identified. Based on these studies, new requirements for the application to be developed have emerged. This involves addressing the weaknesses of existing applications and proposing enhancements to improve them. A thorough analysis of the project's scope and functions is essential to clearly define the system requirements. This phase also involves identifying the contributions of the existing system and determining how the new system can be developed to meet future needs.

In this phase, the project requirements are translated into code. This includes developing the interface, login system, tracking features, and user details. Writing the code for location and image sharing, which involves generating coordinates and transmitting them to the server, is a particularly challenging aspect. Once the coding is complete, the system is evaluated to identify any bugs or errors. If issues are found, the system may undergo a reconstruction process to resolve them.

After the code is completed, the interface design and coding are integrated to form a new mobile application. Once the software has been thoroughly tested and no major issues are detected, it is ready for production, where it can be used by customers.
After the software version is released for production, a maintenance team is typically responsible for addressing any post-production issues. If a problem is identified, the development team is notified. Depending on the severity of the issue, a hotfix may be quickly implemented and deployed. For less critical issues, they may be addressed in the next software version update.

3. Results and Discussion

In this stage, the installation and setup of system requirements necessary for the project's development are completed. The hardware is set up and tested to ensure it meets the project's compatibility and performance needs. The configuration and deployment of the real-time family tracking app are implemented in Android Studio using the Java language. The app is connected to Firebase for database storage. This process involves both software and hardware configurations, ensuring that all components align with the system design and meet the project's expectations.

3.1 Family Tracking real-time (Parent)

a) Children Registration

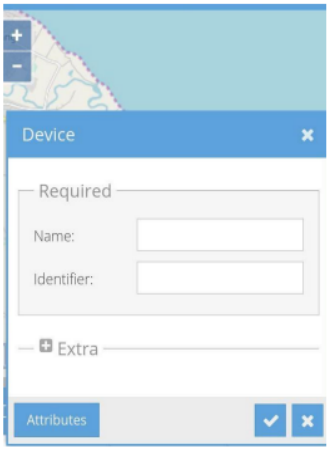

Fig. 2. Device form

Figure 2 illustrates the device form registration. The menu consists of two mandatory fields: one for entering the child's name and another for entering the unique identifier from the Family Tracking app (Children). After completing the form, users can tap the tick symbol to submit or the cross symbol to cancel.

b) Map

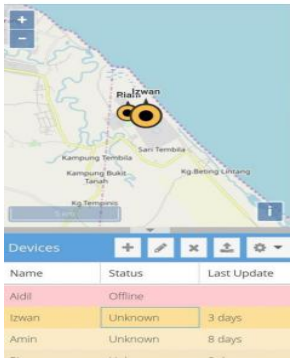

Fig. 3. Real-time location

Figure 3 displays the real-time locations of the children along with a list of their names. To locate a specific child, simply tap on their name in the list.

3.2 Family Tracking real-time (Children)

a) Interface

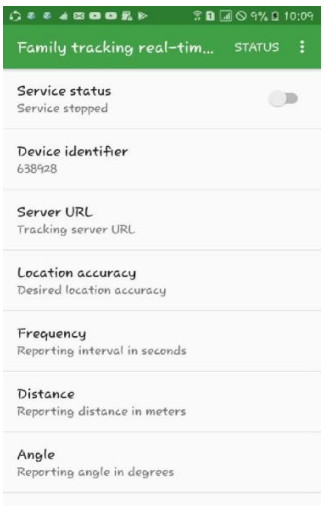

Fig. 4. Family tracking application interface

Figure 4 shows the real-time interface of the Family Tracking application(children). It displays information such as service status, device identifier, URL server, location accuracy, frequency, distance, and angle. The toggle function enables your phone to connect to GPS.

b) Number of Identifier

Fig. 5. Unique identifier number

Figure 5 shows the unique identifier number. The identifier is used to replace the phone number and is exclusive to a single device. This technique is to prevent children from cheating.

The application is tested using both black box and white box testing methods. Black box testing focuses on the application's functionality without knowing the internal structure, while white box testing involves analyzing the system's internal structure.

4. Conclusion

This project demonstrates the feasibility of a real-time family tracking system using GPS and Firebase. It successfully meets its objectives to monitor children remotely and contributes to mitigating social issues. Future improvements may include machine learning integration for predictive movement analysis and cross-platform compatibility.

KEBERKESANAN PENGGUNAAN PERISIAN *LIVEWIRE* DALAM MENINGKATKAN PEMAHAMAN PELAJAR TERHADAP TOPIK PEMASA

Roslina Saad*, Syuhaila Mustafa, Mohd Huzaimi Md Hussin

Jabatan Kejuruteraan Elektrik, Politeknik Seberang Perai, 13500 Permatang Pauh, Pulau Pinang, Malaysia

*Alamat e-mel penulis: roslina@psp.edu.my

Abstrak

Kajian ini bertujuan untuk menilai keberkesanan penggunaan perisian simulasi *Livewire* dalam meningkatkan pemahaman pelajar terhadap topik pemasa 555 dalam kursus Electronic Circuits (DEE30043). Pemasa 555 merupakan komponen penting dalam litar elektronik yang sering digunakan dalam konfigurasi *astable* dan *monostable*, namun pelajar menghadapi kesukaran untuk memahami operasi dalaman dan fungsinya. Reka bentuk kuasi-eksperimen digunakan, melibatkan 30 orang pelajar semester 3 Sesi 2 2024/2025 yang mengambil kursus DEE30043 di Jabatan Kejuruteraan Elektrik di Politeknik Seberang Perai. Data dikumpulkan melalui ujian pra dan pasca serta soal selidik persepsi pelajar. Dapatan menunjukkan peningkatan yang signifikan dalam skor pemahaman selepas menggunakan *Livewire*, dengan purata markah meningkat daripada 52.3% kepada 78.6% ($p < .05$). Sebanyak 93% pelajar bersetuju bahawa *Livewire* membantu mereka memahami topik pemasa, dan 88% menyatakan minat terhadap subjek turut meningkat. Kajian mencadangkan bahawa perisian simulasi seperti *Livewire* berpotensi menjadi alat bantu pengajaran yang berkesan, terutamanya bagi topik yang kompleks dan abstrak.
Kata kunci: *Livewire*; Pemasa 555; Pemahaman pelajar.

1. Pengenalan

Perkembangan teknologi maklumat dan komunikasi (ICT) telah mendorong perubahan dalam pendekatan pengajaran dan pembelajaran, khususnya dalam bidang kejuruteraan. Kaedah tradisional seperti ceramah dan latihan berasaskan perkakasan sebenar sering kali tidak mencukupi untuk menerangkan konsep yang bersifat abstrak dan kompleks (Rahman & Ahmad, 2020). Dalam kursus Litar Elektronik (DEE30043), topik berkaitan pemasa 555 sering dikenal pasti sebagai antara topik yang mencabar untuk difahami oleh pelajar kerana memerlukan kefahaman mendalam terhadap operasi dalaman, konfigurasi *astable* dan *monostable*, serta aplikasinya dalam litar sebenar.

Kajian oleh Rahman dan Ahmad (2020) mendapati bahawa kaedah ceramah secara pasif menyebabkan pelajar sukar untuk mengaplikasikan teori pemasa 555 ke dalam situasi dunia sebenar. Manakala Yusof et al. (2021) pula menunjukkan bahawa pelajar yang hanya terdedah kepada latihan makmal tanpa visualisasi digital menunjukkan pencapaian rendah dari aspek pemahaman konsep. Omar et al. (2023) pula menegaskan bahawa penggunaan simulasi elektronik seperti *Livewire* dapat membantu pelajar membina pemahaman konseptual secara lebih interaktif dan visual, sekali gus meningkatkan tahap penguasaan topik-topik seperti pemasa 555.

Kajian oleh Dewi et al. (2024) mendapati peningkatan signifikan dalam kemahiran psikomotor pelajar selepas menggunakan *Livewire* dalam pembelajaran litar digital dan analog, manakala kajian Azis & Rahmat (2020) pula melaporkan bahawa walaupun *Livewire* digunakan secara meluas, penyelidikan yang menilai keberkesanan spesifik terhadap kefahaman pelajar mengenai pemasa 555 masih terhad. Ini menunjukkan wujudnya jurang dalam penyelidikan, khususnya dari aspek perbandingan prestasi pelajar sebelum dan selepas penggunaan

perisian tersebut, serta persepsi pelajar terhadap pengalaman pembelajaran menggunakan simulasi.

Tambahan lagi, kajian Nordin et al. (2021) mengesyorkan agar pendekatan simulasi diintegrasikan secara sistematik dalam kurikulum kejuruteraan, namun masih belum ada bukti kukuh yang menunjukkan bagaimana ia memberi impak khusus terhadap topik-topik tertentu seperti pemasa 555. Ketiadaan data empirikal yang menyokong keberkesanan *Livewire* dalam konteks ini menimbulkan keperluan untuk satu penyelidikan berstruktur yang dapat mengisi jurang pengetahuan tersebut.

Jurang utama yang dikenal pasti ialah kekurangan penyelidikan empirik yang menilai keberkesanan penggunaan *Livewire* dalam konteks pembelajaran pemasa 555 secara spesifik. Kebanyakan pendekatan pengajaran masih bergantung kepada latihan praktikal berasaskan perkakasan sebenar yang melibatkan kos tinggi, risiko keselamatan dan keperluan masa yang panjang untuk persediaan. Selain itu, kajian berkaitan persepsi pelajar terhadap simulasi *Livewire* juga masih terhad, terutama dari aspek keupayaan simulasi untuk menjelaskan fenomena perubahan voltan, masa tindak balas dan operasi dalaman IC 555. Tambahan pula, belum ada kajian tempatan yang membandingkan prestasi pelajar antara kaedah tradisional dan kaedah simulasi *Livewire* secara sistematik dalam topik pemasa 555. Ketiadaan data kuantitatif yang kukuh menimbulkan persoalan tentang keberkesanan sebenar penggunaan perisian ini dalam meningkatkan pencapaian pelajar.

Sehubungan itu, satu kajian berstruktur dan berdasarkan bukti perlu dijalankan untuk menilai tahap kefahaman pelajar sebelum dan selepas intervensi menggunakan *Livewire*, serta mengkaji persepsi mereka terhadap keberkesanan perisian ini dalam konteks pembelajaran pemasa 555. Dapatan kajian ini akan memberikan sumbangan penting kepada penambahbaikan kaedah pengajaran sedia ada dalam kursus Litar Elektronik dan menyokong penggunaan teknologi pendidikan dalam TVET. Kajian ini menetapkan tiga objektif iaitu menilai tahap kefahaman pelajar terhadap topik pemasa 555 sebelum dan selepas menggunakan perisian *Livewire*,mengenal pasti persepsi pelajar terhadap keberkesanan penggunaan *Livewire* dalam pembelajaran topik pemasa 555 dan menganalisis perbezaan pencapaian pelajar antara kaedah tradisional dan kaedah menggunakan simulasi *Livewire*.

2. Metodologi

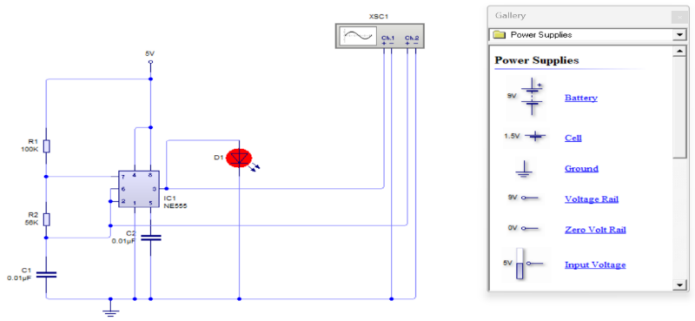
Kajian ini menggunakan reka bentuk kuasi-eksperimen dengan pendekatan pra-ujian dan pasca-ujian kumpulan tunggal (*one-group pretest-post-test design*). Pendekatan ini dipilih bagi menilai perubahan tahap pemahaman pelajar terhadap topik pemasa 555 sebelum dan selepas penggunaan perisian simulasi *Livewire* dalam sesi pengajaran dan pembelajaran. Reka bentuk ini dianggap sesuai untuk menilai keberkesanan sesuatu intervensi apabila pelaksanaan kumpulan kawalan tidak dapat dilakukan disebabkan oleh batasan tertentu dalam konteks pelaksanaan kajian. Soal selidik juga diberikan kepada pelajar untuk menilai tahap

Responden kajian terdiri daripada 30 orang pelajar semester 3 Diploma Kejuruteraan Elektrik dan Elektronik dari Politeknik Seberang Perai yang mengikuti kursus Electronic Circuits (DEE30043). Pemilihan sampel dibuat secara pensampelan bertujuan kerana semua pelajar tersebut terlibat secara langsung dengan topik pemasa 555 dalam kurikulum mereka. Sampel ini dianggap mencukupi bagi kajian awal yang memfokuskan kepada penilaian keberkesanan intervensi pendidikan.

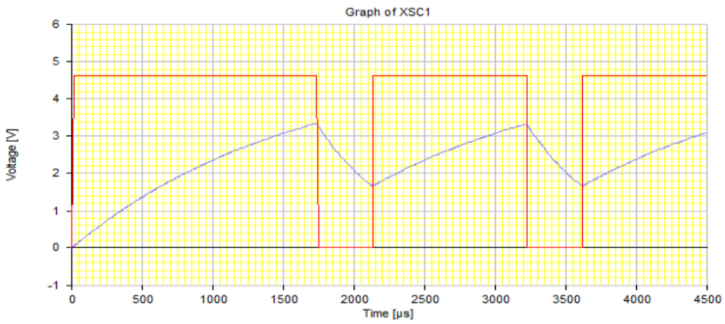
Kajian ini menggunakan dua instrumen iaitu soalan ujian yang berbentuk objektif dan soal selidik.Soalan objektif direka untuk menilai pemahaman pelajar mengenai konfigurasi *astable* dan *monostable* bagi pemasa 555. Litar pemasa *Livewire* ditunjukkan pada Rajah 1 dan juga keluaran pada Rajah 2 yang pelajar boleh lihat semasa simulasi.Skor ujian dikira dalam

bentuk peratus bagi membandingkan prestasi sebelum dan selepas menggunakan perisian *Livewire*. Kajian ini menggunakan skala Likert 5 mata (1 = Sangat Tidak Setuju hingga 5 = Sangat Setuju) kerana ia adalah pendekatan yang lazim digunakan dalam kajian pendidikan di Malaysia dan telah terbukti mudah difahami oleh responden. Selain itu, skala ini menyediakan kestabilan statistik yang baik serta kesesuaian untuk mengukur persepsi dan sikap pelajar dalam konteks pengajaran atas talian dan penggunaan perisian simulasi (Malaysian Journal of Learning and Instruction, 2023). Sebanyak 10 item disusun mengikut tiga dimensi iaitu: Pemahaman Konsep, Minat terhadap Subjek, dan Keberkesanan Penggunaan Perisian *Livewire*. Soal selidik ini bertujuan untuk mendapatkan maklum balas persepsi pelajar terhadap keberkesanan penggunaan perisian simulasi dalam meningkatkan pemahaman mereka. Borang soal selidik telah diedarkan kepada responden secara dalam talian menggunakan aplikasi Google Form. Pemilihan kaedah ini adalah bersesuaian dengan keperluan kajian kerana ia memudahkan proses pengumpulan data maklum balas, mengurangkan keperluan penggunaan kertas, serta mempercepat dan mempertingkat keberkesanan proses pengumpulan data.

Pelajar diberikan taklimat awal mengenai objektif kajian dan dikehendaki menjawab ujian pra bagi menilai tahap pemahaman awal mereka. Seterusnya, sesi pengajaran dijalankan di makmal komputer menggunakan perisian *Livewire* sebagai alat bantu simulasi. Selepas tamat sesi pengajaran, pelajar melengkapkan ujian pasca dan seterusnya menjawab soal selidik persepsi. Keseluruhan proses dilaksanakan dalam tempoh satu minggu kuliah.



Rajah 1. Litar pemasa *Livewire*



Rajah 2. Keluaran simulasi *livewire*

Data kuantitatif daripada ujian pra dan pasca dianalisis menggunakan ujian t-berpasangan bagi menentukan sama ada terdapat perbezaan yang signifikan dalam skor pelajar sebelum dan selepas intervensi. Nilai $p < .05$ ditetapkan sebagai aras signifikan. Data soal selidik pula dianalisis secara deskriptif menggunakan perisian *Statistical Packages for Social Sciences* (SPSS) for Windows versi 29.0 yang melibatkan nilai skor min. Skor min telah diterjermahkan untuk menentukan tahap tinggi, sederhana dan rendah seperti di Jadual 1 merujuk kepada Megat et al. (2007) bagi menilai persepsi pelajar terhadap keberkesanan penggunaan *Livewire*.

Jadual 1. Tafsiran skor min

Julat min	Tahap Persepsi
1.00-2.33	Rendah
2.34-3.66	Sederhana
3.67-5.00	Tinggi

Satu kajian rintis telah dijalankan ke atas 15 orang pelajar yang mendaftar kursus DEE30043-Electronic Circuits bagi menilai kefahaman, kesesuaian dan kebolehpercayaan instrumen soal selidik sebelum digunakan dalam kajian sebenar. Nilai pekali kebolehpercayaan telah ditentukan menggunakan pekali **Cronbach's Alpha**. Menurut Sekaran dan Bougie (2019), nilai Cronbach's Alpha yang melebihi 0.70 menunjukkan tahap kebolehpercayaan yang boleh diterima. Dalam kajian ini, nilai yang diperoleh ialah **0.82,** yang menunjukkan bahawa instrumen ini mempunyai kebolehpercayaan yang baik dan sesuai digunakan untuk kajian sebenar.

3. Dapatan dan Perbincangan

Jadual 2 menunjukkan skor purata dan sisihan piawai bagi ujian pra dan ujian pasca. Dapatan menunjukkan bahawa skor purata bagi ujian pra adalah sebanyak 52.3% dengan sisihan piawai 10.2, manakala skor purata bagi ujian pasca meningkat kepada 78.6% dengan sisihan piawai 8.7. Ini menunjukkan terdapat peningkatan sebanyak 26.3 mata dalam skor purata selepas pelajar mengikuti sesi pengajaran menggunakan perisian simulasi *Livewire*.

Jadual 2. Perbandingan skor purata ujian pra dan pasca

Jenis Ujian	Min (%)	Sisihan Piawai
Ujian Pra	52.3	10.2
Ujian Pasca	78.6	8.7
Perbezaan	26.3	

Bagi menentukan sama ada perbezaan skor tersebut adalah signifikan secara statistik, satu ujian t-berpasangan (paired sample t-test) telah dijalankan. Keputusan analisis menunjukkan bahawa terdapat perbezaan yang signifikan antara skor ujian pra dan ujian pasca dengan nilai $t(29) = -9.87$, dan nilai $p < 0.05$. Keputusan ini menunjukkan bahawa peningkatan skor selepas intervensi adalah signifikan pada aras kebolehpercayaan 95%. Oleh itu, boleh disimpulkan bahawa penggunaan perisian simulasi *Livewire* telah memberikan kesan yang positif terhadap peningkatan pemahaman pelajar dalam topik pemasa 555.

Untuk maklumbalas soal selidik selepas menggunakan simulasi *Livewire* pulak, hasil didapati semua memberi perspektif yang positif terhadap penggunaan Simulasi *Livewire*. Jadual 3 memaparkan skor min bahagian A iaitu pemahaman konsep. Dalam aspek pemahaman konsep, skor purata min keseluruhan adalah 4.3, dengan item tertinggi "Visualisasi litar melalui simulasi memudahkan pemahaman saya" (min = 4.6). Hasil ini selari dengan dapatan Makhrus et al. (2021) yang membuktikan bahawa eksperimen maya menggunakan *Livewire* dapat meningkatkan pemahaman konsep elektronik asas secara signifikan.

Jadual 3. Skor min bahagian A bagi pemahaman konsep

Item	Pernyataan	Min	Tahap
1	Saya memahami fungsi asas pemasa 555.	4.3	Tinggi
2	Saya dapat membezakan antara mod *astable* dan *monostable*.	4.1	Tinggi
3	*Livewire* membantu saya memahami konsep dengan lebih baik.	4.5	Tinggi
4	Visualisasi litar melalui simulasi memudahkan pemahaman saya.	4.6	Tinggi
5	Saya berasa yakin membina litar pemasa menggunakan 555.	4.2	Tinggi
6	Saya dapat mengaplikasikan pemasa 555 dalam projek sebenar.	4.0	Tinggi
	Purata Min	4.3	Tinggi

Bagi minat terhadap subjek yang ditunjukkan dalam Jadual 4, purata min 4.4 membuktikan bahawa penggunaan simulasi menjadikan pembelajaran lebih interaktif dan menarik. Omar et al. (2023) turut mendapati bahawa integrasi perisian simulasi dalam pengajaran meningkatkan motivasi pelajar serta mengurangkan beban kognitif, yang seterusnya meningkatkan penglibatan mereka dalam pembelajaran.

Jadual 4. Skor min bahagian B bagi minat terhadap subjek

Item	Pernyataan	Min	Tahap
1	Saya lebih berminat untuk mempelajari topik pemasa selepas sesi ini.	4.4	Tinggi
2	Sesi pembelajaran menjadi lebih menarik dengan *Livewire*.	4.3	Tinggi
	Purata Min	4.4	Tinggi

Sementara itu, Jadual 5 pula menunjukkan hasil dapatan bagi keberkesanan penggunaan *Livewire*, purata min 4.1 mengesahkan bahawa pelajar menyetujui *Livewire* sebagai alat bantu pengajaran yang relevan. Dapatan ini seiring dengan kajian Arafah et al. (2020) yang menunjukkan bahawa pembelajaran berasaskan inkuiri yang dibantu simulasi *Livewire* adalah sahih, berkesan, dan diterima baik oleh pelajar. Tambahan pula, Miftah et al. (2024) membuktikan bahawa penggunaan *Livewire* dalam pengajaran asas elektronik dapat meningkatkan kreativiti pelajar pada tahap sederhana hingga tinggi. Persepsi positif terhadap penggunaan simulasi juga turut dilaporkan oleh Saris dan Md Sapari (2022) yang mendapati pelajar di universiti Malaysia lebih cenderung memberi maklum balas positif terhadap pembelajaran yang memanfaatkan teknologi gamifikasi dan simulasi.

Jadual 5. Skor min bahagian C bagi keberkesan terhadap *Livewire*

Item	Pernyataan	Min	Tahap
1	Saya ingin menggunakan *Livewire* dalam topik lain juga.	4.0	Tinggi
2	*Livewire* adalah alat bantu pengajaran yang berkesan	4.2	Tinggi
	Purata Min	4.1	Tinggi

4. Kesimpulan

Secara kesimpulannya, kajian ini dijalankan bagi menilai keberkesanan penggunaan perisian simulasi *Livewire* dalam meningkatkan pemahaman pelajar terhadap topik pemasa 555 dalam kursus Electronic Circuits (DEE30043). Berdasarkan analisis yang dijalankan, hasil dapatan menunjukkan peningkatan yang signifikan dalam skor pemahaman pelajar selepas intervensi, di samping persepsi positif terhadap penggunaan *Livewire* sebagai alat bantu pengajaran dan pembelajaran.Penggunaan simulasi elektronik seperti *Livewire* bukan sahaja membantu pelajar memahami konsep yang kompleks melalui pendekatan visual dan interaktif, malah turut meningkatkan minat dan motivasi pelajar terhadap subjek. Oleh itu, pendekatan berasaskan teknologi ini wajar dijadikan sebahagian daripada kaedah pengajaran dalam kursus-kursus kejuruteraan elektrik di peringkat politeknik dan institusi pengajian tinggi yang lain. Penggunaan simulasi jugak membantu memberi kefahaman pelajar terhadap kursus dengan mudah disebabkan boleh mengubah nilai-nilai komponen yang dikehendaki. Berdasarkan hasil kajian, beberapa cadangan dikemukakan bagi penambahbaikan kajian akan datang dan pelaksanaan kaedah pengajaran berasaskan simulasi iaitu pelaksanaan kajian menggunakan reka bentuk eksperimen sebenar dengan kumpulan kawalan bagi meningkatkan keabsahan dalaman kajian.Kajian juga boleh ditambahbaik dengan membuat penambahan saiz sampel daripada pelbagai institusi bagi meningkatkan kesahan dapatan. Kajian juga boleh dibuat dengan mengembangkan keberkesanan *Livewire* dalam topik-topik lain dalam kursus elektronik seperti penguat operasional (OP-AMP) atau transistor serta integrasi *Livewire* dengan pendekatan pembelajaran berasaskan projek (PBL) untuk memperkukuh aplikasi pengetahuan pelajar dalam situasi dunia sebenar. Implikasi daripada kajian ini, dapat disimpulkan bahawa kajian ini penting kepada pendidik dan penggubal kurikulum dalam bidang kejuruteraan. Penggunaan perisian simulasi seperti *Livewire* dapat dijadikan sebagai satu strategi pengajaran yang efektif dalam meningkatkan pemahaman

konsep teknikal yang kompleks. Selain itu, kajian ini juga menunjukkan keperluan untuk memanfaatkan teknologi pendidikan secara lebih meluas dalam pengajaran dan pembelajaran di politeknik dan institusi teknikal.

FAKTOR-FAKTOR YANG MEMPENGARUHI PERSEPSI PELAJAR TERHADAP AMALI KEJURUTERAAN ELEKTRIK SECARA JARAK JAUH: SATU KAJIAN KES DI POLITEKNIK SEBERANG PERAI

Syuhaila Mustafa*, Roslina Saad, Mohd Huzaimi Md Hussin

Jabatan Kejuruteraan Elektrik, Politeknik Seberang Perai, 13500 Permatang Pauh, Pulau Pinang, Malaysia

*Alamat e-mel penulis: syuhaila@psp.edu.my

Abstrak

Kajian ini bertujuan mengenal pasti faktor-faktor yang mempengaruhi persepsi pelajar terhadap pelaksanaan amali Kejuruteraan Elektrik secara jarak jauh di Politeknik Seberang Perai (PSP). Populasi kajian terdiri daripada 470 pelajar Diploma Kejuruteraan Elektrik, manakala sampel seramai 125 pelajar semester 2 sesi II 2024/2025 yang mengikuti kursus *Semiconductor Device* dipilih menggunakan persampelan rawak berstrata. Instrumen kajian ialah soal selidik berstruktur merangkumi faktor kemudahan infrastruktur teknologi, tahap kefahaman, keberkesanan pengajaran pensyarah, motivasi dan minat pelajar. Nilai Alpha Cronbach diperoleh sebanyak 0.91, menunjukkan kebolehpercayaan instrumen sangat tinggi. Analisis deskriptif mendapati skor min keseluruhan persepsi pelajar ialah 4.21 (positif), dengan skor min tertinggi bagi keberkesanan bahan pengajaran dan sokongan pensyarah (4.45) dan terendah bagi ketersediaan peralatan amali di rumah (3.85). Dapatan menunjukkan kemudahan teknologi dan kualiti modul memberi pengaruh signifikan terhadap persepsi pelajar. Kajian mencadangkan penambahbaikan reka bentuk modul amali digital dan pengukuhan sokongan pembelajaran bagi meningkatkan keberkesanan amali secara jarak jauh.

Kata kunci: Pembelajaran jarak jauh; Amali; Pengajaran dan pembelajaran.

1. Pengenalan

Perkembangan teknologi maklumat dan komunikasi telah memberi impak besar kepada bidang pendidikan, khususnya dalam pelaksanaan pembelajaran jarak jauh (PJJ) (Almahasees, et.al , 2021). Situasi pandemik COVID-19 yang melanda dunia telah mempercepatkan lagi adaptasi terhadap kaedah pengajaran secara dalam talian, termasuk kursus yang bersifat amali seperti Kejuruteraan Elektrik (Dhawan, 2020). Walau bagaimanapun, pelaksanaan amali secara jarak jauh menimbulkan pelbagai cabaran dari segi keberkesanan pembelajaran, tahap kefahaman pelajar serta kesediaan infrastruktur dan teknologi (Chaka, 2020).

Di Politeknik Seberang Perai (PSP), kursus amali merupakan komponen penting dalam pembelajaran bagi pelajar Kejuruteraan Elektrik. Justeru, pendekatan jarak jauh yang dilaksanakan memerlukan penilaian rapi terhadap keberkesanannya dari sudut pandangan pelajar. Persepsi pelajar memainkan peranan penting dalam menentukan keberkesanan dan penerimaan terhadap pendekatan ini (Singh & Thurman, 2019).

Oleh itu, kajian ini dijalankan untuk mengenal pasti faktor-faktor yang mempengaruhi persepsi pelajar terhadap amali Kejuruteraan Elektrik secara jarak jauh. Antara faktor yang dijangka memberi kesan ialah kemudahan peralatan dan akses internet, kaedah penyampaian pengajaran, sokongan pensyarah, serta motivasi pelajar (Adnan & Anwar, 2020). Kajian ini dapat memberikan gambaran jelas terhadap pelaksanaan pengajaran dan pembelajaran secara jarak jauh bagi komponen amali, serta mencadangkan penambahbaikan bagi meningkatkan keberkesanan pengajaran dan pembelajaran secara jarak jauh.

Hasil daripada kajian ini dijangka dapat memberi panduan kepada institusi pengajian tinggi dalam merancang pendekatan pengajaran yang lebih sesuai, berkesan dan mesra pelajar, khususnya dalam konteks pendidikan teknikal secara dalam talian.

Berikut merupakan objektif bagi kajian ini:

a) Mengenal pasti tahap persepsi pelajar semester II yang mengikuti Kursus *Semiconductor Devices* terhadap pelaksanaan amali Kejuruteraan Elektrik secara jarak jauh di Politeknik Seberang Perai (PSP).
b) Mengenal pasti faktor-faktor yang mempengaruhi persepsi pelajar terhadap keberkesanan amali secara jarak jauh, seperti kemudahan teknologi, sokongan pensyarah dan minat pelajar.
c) Menganalisis hubungan antara faktor-faktor yang dikenalpasti dengan persepsi pelajar terhadap pembelajaran amali secara jarak jauh

Pelaksanaan pembelajaran jarak jauh (PJJ) telah menjadi satu pendekatan utama dalam sistem pendidikan moden, terutamanya semasa pandemik COVID-19. Beberapa kajian lepas telah meneliti keberkesanan dan cabaran yang dihadapi oleh pelajar dalam mengikuti pembelajaran secara dalam talian, termasuk bagi subjek yang berasaskan amali.

Menurut Dhawan (2020), pembelajaran jarak jauh (PJJ) menyediakan peluang fleksibel kepada pelajar, namun kurangnya interaksi fizikal dan praktikal boleh menjejaskan keberkesanan dalam pembelajaran berasaskan kemahiran. Ini disokong oleh Adnan dan Anwar (2020) yang mendapati bahawa pelajar kurang yakin dengan penguasaan kemahiran teknikal apabila kelas amali dijalankan secara dalam talian.

Chaka (2020) menekankan bahawa faktor infrastruktur seperti akses kepada peralatan, kestabilan internet, dan perisian yang sesuai merupakan antara penyumbang utama kepada keberkesanan pembelajaran amali secara jarak jauh. Kajian oleh Singh dan Thurman (2019) turut menunjukkan bahawa keberkesanan pengajaran banyak dipengaruhi oleh strategi penyampaian yang digunakan oleh pensyarah, termasuk penggunaan video, simulasi dan demonstrasi interaktif.

Di samping itu, Almahasees, et.al (2021) menegaskan bahawa persepsi pelajar terhadap pembelajaran dalam talian dipengaruhi oleh motivasi dalaman, tahap literasi teknologi, dan sokongan yang diterima sepanjang proses pembelajaran. Ini menunjukkan bahawa faktor-faktor bukan teknikal seperti sikap, minat, dan pengalaman pelajar juga memainkan peranan yang besar.

Walaupun banyak kajian telah dijalankan berkaitan pembelajaran jarak jauh (PJJ), namun terdapat kekurangan kajian spesifik yang meneliti pelaksanaan amali Kejuruteraan Elektrik secara jarak jauh dalam konteks politeknik di Malaysia, terutamanya dari sudut persepsi pelajar. Justeru, kajian ini bertujuan untuk mengisi jurang tersebut dengan meneliti secara lebih mendalam faktor-faktor yang mempengaruhi persepsi pelajar di Politeknik Seberang Perai terhadap pelaksanaan amali secara jarak jauh.

Kajian selepas pandemik turut menunjukkan peralihan fokus daripada sekadar kesinambungan pembelajaran kepada keberkesanan jangka panjang (PJJ). Menurut Abdullah dan Rahman (2022), pelajar institusi TVET di Malaysia mula menyesuaikan diri dengan penggunaan teknologi digital, namun keberkesanan amali masih dipengaruhi oleh ketersediaan peralatan di rumah serta kemahiran pensyarah dalam mengadaptasi pengajaran. Sementara itu, kajian oleh Lee, et.al. (2023) mendapati bahawa selepas pandemik, motivasi pelajar meningkat apabila kaedah pembelajaran jarak jauh (PJJ) digabungkan dengan sesi praktikal bersemuka secara berkala.

Dalam konteks amali TVET secara dalam talian, kajian oleh Noor Azman et al. (2023) menekankan bahawa pembelajaran berasaskan simulasi dapat mengurangkan jurang kemahiran praktikal, terutamanya dalam kursus Kejuruteraan Elektrik. Simulasi interaktif membolehkan pelajar mempraktikkan prosedur kerja dalam persekitaran maya sebelum berhadapan dengan peralatan sebenar. Ini selari dengan dapatan Hamid dan Fauzi (2024) yang melaporkan bahawa penggunaan perisian simulasi seperti *Multisim* dan *Proteus* meningkatkan tahap kefahaman konsep litar elektrik sehingga 18% berbanding kaedah kuliah semata-mata.

Dapatan daripada kajian-kajian terkini ini mengukuhkan hujah bahawa gabungan kaedah simulasi, sokongan teknologi, dan bimbingan pensyarah yang berterusan dapat meningkatkan keberkesanan pelaksanaan amali secara jarak jauh bagi kursus berasaskan kemahiran.

2. Metodologi

Kajian ini menggunakan pendekatan kuantitatif dengan kaedah kajian tinjauan (survey) bagi mengenal pasti faktor-faktor yang mempengaruhi persepsi pelajar terhadap amali Kejuruteraan Elektrik secara jarak jauh. Kajian ini dilaksanakan dalam bentuk kajian kes di Politeknik Seberang Perai (PSP).

Reka bentuk kajian ini adalah berbentuk deskriptif dan inferensi, yang bertujuan untuk mendapatkan data secara langsung daripada pelajar melalui soal selidik yang dibangunkan khusus berdasarkan objektif kajian. Data yang dikumpul dianalisis untuk mengenal pasti hubungan antara pemboleh ubah bebas (faktor-faktor pengaruh) dengan pemboleh ubah bersandar (persepsi pelajar).

Populasi kajian terdiri daripada pelajar Kejuruteraan Elektrik di Politeknik Seberang Perai (PSP) semester 2 sesi II 2024/2025 yang terdiri daripada tiga program pengajian iaitu Diploma Kejuruteraan Elektrik dan Elektronik (DEE), Diploma Kejuruteraan Elektronik (Komunikasi) (DEP) dan Diploma Kejuruteraan Elektronik (Komputer) (DTK) yang telah mengikuti kursus amali secara jarak jauh bagi kursus Semiconductor Devices. Sampel dipilih menggunakan kaedah pensampelan bertujuan (purposive sampling). Seramai 125 pelajar terlibat sebagai responden kajian, ianya menepati jadual penentuan sampel Krejcie dan Morgan (1970).

Instrumen kajian ialah borang soal selidik yang dibahagikan kepada tiga bahagian utama:

Bahagian A: Maklumat demografi pelajar
Bahagian B: Tahap persepsi pelajar terhadap pelaksanaan amali jarak jauh
Bahagian C: Faktor-faktor yang mempengaruhi persepsi seperti kemudahan teknologi, keberkesanan pengajaran, motivasi, dan sokongan pensyarah

Soal selidik menggunakan skala Likert 5 mata (1 = Sangat Tidak Setuju hingga 5 = Sangat Setuju).

Soal selidik diedarkan secara dalam talian menggunakan platform *Google Form* bagi memudahkan capaian responden dan menjimatkan masa. Maklumat berkaitan kajian turut dijelaskan di bahagian awal borang soal selidik sebagai langkah persetujuan bermaklumat. Untuk menentukan instrumen kajian mempunyai nilai kesahan dan kebolehpercayaan yang baik, satu kajian rintis telah dijalankan kepada 30 pelajar yang mempunyai ciri serta situasi yang sama dengan populasi sebenar dan dapatan analisis kajian rintis menunjukkan indeks kebolehpercayaan Alpha Cronbach ialah 0.91. Dapatan ini menunjukkan instrumen berada dalam keadaan sangat baik dan efektif dengan tahap konsisten yang tinggi sekaligus boleh digunakan dalam penyelidikan sebenar (Bond & Fox 2003).

Data yang dikumpul dianalisis menggunakan perisian SPSS versi 29. Analisis yang dijalankan termasuk:

a. Statistik deskriptif untuk frekuensi, peratusan dan min
b. Analisis korelasi untuk melihat hubungan antara pemboleh ubah
c. Analisis regresi bagi menentukan pengaruh setiap faktor terhadap persepsi pelajar

3. Dapatan dan Perbincangan

Seramai 125 responden dari tiga program yang terdapat di Jabatan Kejuruteraan Elektrik, Politeknik Seberang Perai telah mengambil bahagian dan berkongsi maklum balas mereka mengenai pelaksanaan amali secara jarak jauh. Daripada jumlah tersebut, 88% merupakan pelajar lelaki dan 12% pelajar perempuan. Analisis deskriptif menunjukkan bahawa secara keseluruhannya, persepsi pelajar terhadap amali Kejuruteraan Elektrik secara jarak jauh berada pada tahap sederhana. Jadual 1 menunjukkan nilai min dan tahap bagi item persepsi pelajar terhadap amali jarak jauh.

Pelajar memberi respon yang paling tinggi bagi item faham apa yang diajar dalam amali jarak jauh walaupun masih ditahap sederhana. Manakala item yang berada di tahap paling rendah pula adalah amali jarak jauh sama berkesan seperti fizikal iaitu dengan nilai skor min 2.65. Dapatan ini menunjukkan bahawa walaupun kaedah penyampaian yang interaktif memberi kesan positif, pelajar masih merasakan keberkesanan amali dalam talian tidak setara dengan amali fizikal.

Jadual 1. Nilai min dan tahap bagi item persepsi pelajar terhadap amali jarak jauh

Item Persepsi	Min	Tahap
Saya faham apa yang diajar dalam amali jarak jauh	3.42	Sederhana
Amali membantu penguasaan kemahiran teknikal	3.18	Sederhana
Minat terhadap amali jarak jauh	3.05	Sederhana
Amali jarak jauh sama berkesan seperti fizikal	2.65	Rendah
Skor Min Keseluruhan	3.22	Sederhana

Merujuk kepada Jadual 2, didapati pelajar berpendapat pelaksanaan amali jarak jauh dari aspek kemudahan teknologi memberikan impak yang sangat ketara di mana item bagi tiada masalah teknikal menunjukkan nilai skor min 2.88 yang membawa nilai tahap rendah. Selain itu, pelajar juga berpendapat item bagi peralatan mencukupi hanya tahap sederhana dengan nilai skor min 3.10 dan internet stabil juga berapa pada tahap yang sama dengan nilai skor min 3.05.

Jadual 2. Nilai min dan tahap bagi item kemudahan teknologi

Item Persepsi	Min	Tahap
Peralatan Mencukupi	3.10	Sederhana
Internet Stabil	3.05	Sederhana
Tiada masalah teknikal	2.88	Rendah
Skor Min Keseluruhan	3,01	Sederhana

Jadual 3 menunjukkan faktor penyampaian pensyarah mencatatkan skor min keseluruhan tertinggi dalam kajian ini (min = 3.74, tahap tinggi), di mana ia memainkan peranan besar dalam membentuk persepsi positif pelajar terhadap amali jarak jauh. Nilai min tertinggi dicatatkan oleh item *mudah hubungi pensyarah* (min = 3.78, tahap tinggi), menandakan bahawa komunikasi yang lancar meningkatkan kefahaman dan keyakinan pelajar. Nilai min terendah dalam faktor ini ialah *arahan jelas* (min = 3.68, tahap sederhana), menunjukkan masih terdapat ruang untuk penambahbaikan dalam penyampaian arahan semasa kelas amali.

Jadual 3. Nilai min dan tahap bagi item kemudahan teknologi

Item Persepsi	Min	Tahap
Penggunaan bahan bantu (video/ simulasi)	3.75	Tinggi
Mudah hubungi pensyarah	3.78	Tinggi
Arahan jelas	3.68	Sederhana
Skor Min Keseluruhan	3.74	Tinggi

Skor min keseluruhan bagi faktor motivasi ialah 3.25 pada tahap sederhana. Jadual 4 menunjukkan nilai min bagi setiap item. Nilai min tertinggi ialah ulangkaji selepas kelas (min = 3.68, tahap sederhana), manakala nilai terendah ialah fokus semasa kelas (min = 2.95, tahap rendah). Pelajar cenderung untuk melakukan ulang kaji selepas sesi amali, namun ramai yang mudah hilang tumpuan kerana suasana rumah tidak seperti di makmal. Faktor ini memberi kesan kepada keberkesanan pembelajaran jarak jauh, walaupun semangat belajar pelajar berada pada tahap sederhana dengan nilai skor min 3.12.

Jadual 4. Nilai min dan tahap bagi item kemudahan teknologi

Item Persepsi	Min	Tahap
Semangat belajar	3.12	Sederhana
Fokus semasa kelas	2.95	Rendah
Ulang kaji selepas kelas	3.68	Sederhana
Skor Min Keseluruhan	3.25	Sederhana

Merujuk Jadual 5, dapatan ini mengesahkan bahawa penyampaian pensyarah adalah faktor paling kuat mempengaruhi persepsi pelajar, diikuti kemudahan teknologi dan motivasi pelajar.

Jadual 5. Analisis korelasi

Pembolehubah	r	Nilai-p	Keputusan
Kemudahan Teknologi vs Persepsi	0.43	<0.01	Signifikan Sederhana
Penyampaian Pensyarah vs Persepsi	0.61	<0.01	Signifikan Kuat
Motivasi vs Persepsi	0.39	<0.05	Signifikan Sederhana

Keputusan kajian menunjukkan bahawa persepsi pelajar terhadap amali jarak jauh berada pada tahap sederhana, menandakan pelajar masih belum sepenuhnya bersedia menerima amali secara jarak jauh sebagai alternatif setara kepada amali fizikal. Faktor penyampaian pensyarah merupakan faktor paling dominan yang memberi kesan terhadap persepsi positif. Ini selari dengan kajian Dhawan (2020) dan Singh & Thurman (2019) yang menyatakan bahawa strategi pengajaran dan bahan bantu memainkan peranan besar dalam keberkesanan pembelajaran dalam talian. Dapatan ini menunjukkan bahawa pelajar secara umum berpuas hati dengan pendekatan penyampaian pensyarah, terutamanya dalam menyediakan bahan bantu seperti video atau simulasi yang membantu proses pemahaman amali. Hal ini selari dengan kajian Singh dan Thurman (2019) yang menyatakan penggunaan kaedah pengajaran berasaskan teknologi seperti video interaktif dapat meningkatkan kefahaman pelajar dalam pembelajaran berasaskan kemahiran.

Kajian tempatan oleh Zainal dan Rahman (2023) mengenai amali TVET dalam talian turut mendapati bahawa arahan yang terlalu ringkas atau bergantung kepada teks tanpa demonstrasi langsung boleh menjejaskan kefahaman pelajar. Oleh itu, strategi penyampaian yang menggabungkan video langkah demi langkah, sesi soal jawab langsung, dan nota visual disyorkan bagi meningkatkan keberkesanan penyampaian. Sebaliknya, kekangan peralatan dan masalah teknikal terus menjadi isu utama seperti dilaporkan oleh Adnan & Anwar (2020). Ini menunjukkan perlunya sokongan institusi dari segi penyediaan kit amali mini, akses ke makmal maya atau perisian simulasi.

Motivasi pelajar pula berada di tahap sederhana. Ini konsisten dengan kajian Chaka (2020**)** yang menegaskan bahawa suasana persekitaran dan kurangnya interaksi rakan sebaya turut memberi kesan terhadap tumpuan dan minat pelajar.

Selain itu, kajian selepas pandemik oleh Rahman et al. (2022) mengenai amali berasaskan simulasi bagi kursus TVET mendapati bahawa walaupun simulasi dapat mengekalkan minat pelajar, ia tidak sepenuhnya menggantikan pengalaman amali di makmal. Justeru, pendekatan hibrid yang menggabungkan simulasi interaktif dengan sesi amali fizikal yang dijadualkan secara berkala boleh menjadi strategi yang lebih berkesan untuk mengekalkan motivasi dan fokus pelajar.

4. Kesimpulan

Kajian ini bertujuan untuk mengenal pasti persepsi pelajar terhadap pelaksanaan amali Kejuruteraan Elektrik secara jarak jauh serta meneliti faktor-faktor yang mempengaruhinya. Berdasarkan hasil soal selidik terhadap 125 pelajar di Politeknik Seberang Perai, didapati bahawa tahap persepsi pelajar berada pada tahap sederhana, dengan beberapa kekangan utama yang memberi kesan terhadap pengalaman pembelajaran mereka. Faktor penyampaian pensyarah dikenal pasti sebagai pengaruh paling besar terhadap persepsi pelajar, diikuti oleh faktor kemudahan teknologi dan motivasi pelajar. Walaupun pensyarah berusaha menggunakan pendekatan interaktif, pelajar masih menghadapi kekangan seperti sambungan internet yang lemah, kekurangan peralatan di rumah, serta kesukaran memberi tumpuan semasa kelas berlangsung dari rumah. Kajian ini menyimpulkan bahawa walaupun amali secara jarak jauh memberi alternatif pembelajaran ketika krisis seperti pandemik, ia tidak dapat sepenuhnya menggantikan pengalaman pembelajaran secara fizikal terutamanya bagi kursus teknikal yang memerlukan kemahiran tangan.

Kajian ini mendapati bahawa pelaksanaan amali secara jarak jauh bagi kursus teknikal dan vokasional (TVET) menghadapi cabaran, terutamanya dalam penguasaan kemahiran teknikal oleh pelajar. Implikasi daripada penemuan ini adalah penting bagi pelbagai pihak. Dari sudut pengajaran dan pembelajaran, pensyarah perlu menyesuaikan kaedah amali dengan strategi yang lebih interaktif seperti simulasi dan video demonstrasi, serta berperanan aktif sebagai fasilitator digital untuk memberi sokongan berterusan kepada pelajar. Bagi pihak institusi, pelaburan dalam peralatan seperti kit praktikal di rumah dan infrastruktur digital yang canggih adalah perlu untuk menggantikan pengalaman fizikal di makmal. Selain itu, pembangunan polisi atau garis panduan khusus bagi pelaksanaan amali TVET secara jarak jauh amat diperlukan untuk memastikan keberkesanan dan kualiti pembelajaran. Untuk kajian akan datang, dicadangkan agar kajian bandingan antara amali fizikal dan jarak jauh dilaksanakan. Penggunaan kaedah kualitatif seperti temubual mendalam juga disarankan bagi mendapatkan pemahaman yang lebih jelas tentang cabaran sebenar. Akhir sekali, sampel kajian perlu diperluaskan ke lebih banyak institusi untuk meningkatkan kebolehpercayaan dan generalisasi dapatan.

ECO LUMINOUS PAVEMENT

Airiel Afiez Khairolazmy*, Muhammad Syakir Ahmad Abu, Sheikh Yusuf Al-Hamdani Sheikh Ahmad Rafaei, Ajlaa Anis Azmi

Program Teknologi Pembinaan, Kolej Vokasional Alor Setar, 5100 Jalan Stadium, Alor Setar, Kedah

*Alamat e-mel penulis: ajlaaanis08@gmail.com

Abstrak

Eco Luminous Pavement adalah satu idea inovasi untuk menambahkan elemen pencahayaan pada blok laluan pejalan kaki sedia ada di pasaran bagi menambahkan lagi kelainan dan nilai estetika pada blok pejalan kaki tersebut. Apabila waktu malam blok laluan pejalan kaki ini akan bercahaya dengan sendirinya menggunakan konsep '*glow in the dark'* dengan penambahan bahan luminous dalam penghasilan produk ini. Bahan yang digunakan untuk menghasilkan blok laluan pejalan kaki ialah serbuk bercahaya iaitu *luminescent powder*, batu bercahaya (*luminescent stone*), hancurkan batu, sabut kelapa dan simen. Produk ini menggunakan penambahan bahan kitar semula dalam nisbah simen iaitu sabut kelapa bagi mengurangkan kos penghasilan produk disamping menambahkan konsep hijau ke dalam produk. Produk ini mempunyai nilai pasaran yang tersendiri kerana menggunakan konsep *glow in the dark,* keunikan gabungan elemen pencahayaan dan mesra alam serta ketahanan produk ini lebih kuat berbanding blok sedia. Produk ini dihasilkan dalam bentuk sarang lebah (*honeycomb*). Pengujian yang terlibat dalam penghasilan produk ini adalah pengujian berat produk, ujian mampatan dan ujian visual. Kajian soal selidik juga diedarkan kepada responden yang terdiri daripada Pihak Berkuasa Tempatan, kontraktor, pembekal bahan binaan dan pengguna kawasan riadah yang difokuskan. Soal selidik diedarkan melalui medium *google form* yang terbahagi kepada dua (2) soal selidik iaitu kajian sebelum reka bentuk produk dan kajian selepas reka bentuk produk. Penggantian 20% sabut kelapa dalam penghasilan blok pejalan kaki ini juga dapat meningkatkan daya mampatan blok pejalan kaki iaitu 15.8 MPa lebih tinggi berbanding blok pejalan kaki sedia ada dipasaran iaitu 11.6 MPa.
Kata kunci: Luminous; Kitar semula; Sabut kelapa.

1. Pengenalan

Tujuan produk ini adalah untuk menghasilkan blok pejalan kaki bercahaya yang dapat menarik perhatian pengguna terutamanya pada waktu malam kerana ia dapat bercahaya dengan sendirinya. Selain itu, blok ini dapat mengelakkan pencemaran alam sekitar dengan menggunakan penambahan bahan sisa buangan yang dikitar semula iaitu sabut kelapa. Produk ini juga dapat menghasilkan blok laluan pejalan kaki yang menarik dan mempunyai nilai estetika yang tersendiri. Pernyataan masalah bagi produk ini adalah blok pejalan kaki sedia ada di pasaran tidak dapat bercahaya dengan sendirinya pada waktu malam. Jika tiada lampu jalan di kawasan tersebut ianya akan menyukarkan penggunaan untuk melihat blok pejalan kaki pada waktu malam. Sabut kelapa yang tidak digunakan hanya dibuang atau dibakar dan isu ini boleh menyebabkan pencemaran alam sekitar. Terdapat dua (2) objektif dalam menghasilkan produk ini, pertama adalah untuk menghasilkan blok laluan pejalan kaki yang bercahaya "*glow in the dark"* pada waktu malam. Objektif kedua adalah untuk menghasilkan blok laluan pejalan kaki yang menggunakan bahan kitar semula iaitu sabut kelapa. Produk ini memberikan kepentingan kepada empat (4) pihak iaitu Pihak Berkuasa Tempatan, kontraktor, pembekal bahan binaan dan pengguna kawasan riadah.

Satu kajian yang dihasilkan oleh Deepika et,al (2002) iaitu *A Study of Materials For Luminescent Concrete Pavement* menggunakan penambahan bahan *Luminescent Powder (LP)* dan *Reflective Powder (RP)* dalam blok pejalan kaki konkrit. Menurut kajian ini terdapat

hipotesis menyatakan bahawa dengan penambahan LP dan RP dalam konkrit dapat mengurangkan kuasa pada waktu malam. Berdasarkan kajian yang telah Deepika et,al (2002) jalankan menunjukkan bahawa penggunaan kuasa elektrik lampu jalan mewakili sekitar 20% hingga 30% daripada penggunaan kuasa lampu awam manakala kadar penggunaan kuasa adalah di bawah 65%. Bahan bercahaya adalah sejenis *photoluminescent* yang boleh menyimpan tenaga apabila ia disinari oleh cahaya dan terus memancarkan cahaya. Salutan bercahaya ini dibuat dengan menggabungkan warna-warna yang cerah, bahan pembentukan filem dan bahan tambahan yang sesuai dengan keadaan laluan pejalan kaki tersebut (Bailin Shah et.al, 2022). Wentong Wang et.al, (2021) menyatakan komposit berasaskan konkrit bercahaya sendiri digunakan dalam pembangunan dan bahan binaan untuk mengurangkan penggunaan kuasa, berfungsi pada kebolehlihatannya pada waktu malam.

Simen bercahaya mendapatkan tenaga cahaya berasaskan matahari pada waktu siang dan menukarkannya kepada cahaya pada waktu malam. Simen bersinar juga dipanggil simen nyah cas ringan atau *Glow in obscurity concrete (GID)* (Mousheen et.al, 2022). Bahan yang digunakan dalam konkrit ini ialah simen, batu aggregate, air dan resin glowing luminous stone yang digunakan untuk denai, batu dan simen terazo. *Glowing Concrete* dihasilkan dengan menggunakan *resin glowing luminous stone* untuk menggantikan jumlah agregat kasar yang sama dalam nisbah yang berbeza dan juga membantu menghasilkan semula cahaya pada waktu malam tanpa menggunakan tenaga elektrik

Projek jalan yang dicat menggunakan teknologi *glow in the dark* pertama di negara ini adalah di Jalan Sungai Lalang (B19) di Hulu Langat. Ahli Parlimen Hulu Langat, Mohd Sany Hamzan berkata, projek perintis dilaksanakan Jabatan Kerja Raya (JKR) Daerah Hulu Langat itu membolehkan pemanduan menjadi lebih selamat dengan bantuan pantulan cahaya pada pembahagi jalan. Cat jalan bernyala dalam gelap ini adalah cubaan projek rintis daripada pihak (JKR) Daerah Hulu Langat dalam membawa inovasi dalam kejuruteraan jalan. Reka cipta ini diilhamkan bagi membantu pemanduan yang lebih selamat di jalan raya pada waktu malam. Dengan mengekalkan ciri pemantulan cahaya kuning dengan penggunaan *High Intensity Prismatic Sheet,* kaedah pencahayaan ditambah baik dengan ciri pendarfluor atau lebih dikenali sebagai teknologi *glow in the dark* yang mengandungi elemen fosforus pigmen bagi mengeluarkan cahaya yang boleh dilihat selepas diberi tenaga. Sumber tenaga adalah sama ada daripada cahaya matahari atau lampu kenderaan yang diserap, sebelum bercahaya semula atau dapat dilihat pada waktu malam.

2. Metodologi

Instrumen kajian yang digunakan bagi produk ini adalah soal selidik. Soalan soal selidik diedarkan melalui aplikasi *google form* kepada responden. Populasi yang dipilih adalah dikalangan Pihak Berkuasa Tempatan, kontraktor, pembekal bahan binaan dan pengguna kawasan riadah dari kawasan kulim. Bagi Pihak Berkuasa Tempatan iaitu Majlis Perbandaran Kulim populasi responden hanya berfokus kepada Jabatan Pernacangan dan Landskap sahaja. Responden yang digunakan dalam kajian ini adalah seramai 37 orang yang terdiri daripada 20 peratus (%) Pihak Berkuasa Tempatan, 23 peratus (%) kontraktor, 53 peratus (%) pengguna kawasan riadah dan 3 peratus (%) pembekal bahan binaan.

Dapatan diatas menunjukkan bahawa responden bersetuju bahawa blok pejalan kaki sedia ada dipasaran tidak menarik pada waktu malam dimana responden bersetuju dengan penambahan bahan luminous supaya blok tersebut dapat bercahaya dengan sendirinya pada waktu malam. Selain daripada itu responden bersetuju bahawa sabut kelapa sesuai digunakan sebagai bahan tambahan dalam penghasilan blok ini disamping dapat mengurangkan pencemaran.

Jadual 1. Analisa reka bentuk blok pejalan kaki sedia ada

Bil	Soalan	Sangat Setuju (%)	Setuju (%)	Neutral (%)	Tidak Setuju (%)	Sangat Tidak Setuju (%)
1	Blok pejalan kaki sedia ada tidak menarik perhatian pada waktu malam	18.9	59.5	18.9	2.7	0
2	Blok pejalan kaki sedia ada mudah dilihat di waktu malam tanpa lampu?	2.7	35.1	10.8	32.4	18.9
3	Penambahan bahan luminous dalam blok pejalan kaki boleh menyebabkan ia bercahaya pada waktu malam	32.4	54.1	5.4	8.1	0
4	Sabut kelapa boleh digunakan sebagai bahan tambahan dalam blok pejalan kaki	13.5	56.8	18.9	8.1	2.7
5	Penambahan sabut kelapa dalam blok pejalan kaki dapat mengurangkan pencemaran	21.6	51.4	16.2	8.1	2.7

Hasil dapatan daripada soal selidik ini menunjukkan bahawa responden berpuas hati dan bersetuju dengan penambahan bahan luminous ke atas blok pejalan kaki yang menyebabkan blok pejalan kaki ini menarik pada waktu malam kerana ianya boleh bercahaya dengan sendirinya dan dapat dilihat pada waktu malam tanpa bantuan lampu. Responden juga bersetuju bahawa dengan penambahan sabut kelapa dalam pembuatan blok pejalan kaki ini dapat mengurangkan berat blok pejalan kaki serta dapat meningkatkan kekuatan mampatannya.

Jadual 2. Analisa kajian selepas reka bentuk produk

Bil	Soalan	Sangat Setuju (%)	Setuju (%)	Neutral (%)	Tidak Setuju (%)	Sangat Tidak Setuju (%)
1	Blok pejalan kaki luminous ini menarik perhatian pada waktu malam	70.4	29.6	0	0	0
2	Blok pejalan luminous mudah dilihat di waktu malam tanpa lampu?	51.9	33.3	14.8	0	0
3	Penambahan bahan luminous dalam blok pejalan kaki boleh menyebabkan ia bercahaya pada waktu malam	59.3	33.3	7.4	0	0
4	Penambahan sabut kelapa dalam blok pejalan kaki dapat mengurangkan berat blok pejalan kaki	22.2	48.1	11.1	18.5	0
5	Penambahan sabut kelapa dalam blok pejalan kaki dapat menguatkan kekuatan mampatan	55.6	40.7	3.7	0	0

3. Dapatan dan Perbincangan

Terdapat tiga kaedah pengujian yang dijalankan dalam penghasilan produk ini iaitu pengujian berat konktit, ujian mampatan dan pengujian visual. Saiz sampel yang digunakan untuk eksperimen ini adalah 15cm x 15cm x 15cm iaitu saiz bagi pengujian kiub.

Hasil daripada analisa berat nisbah bancuhan konkrit, berat konkrit campuran sabut kelapa pada 28 hari paling tinggi iaitu 7.6 kilogram dan berat konkrit yang paling ringan ialah konkrit campuran sekam padi iaitu 6.8 kilogram pada 28 hari. Hasil pengujian menunjukkan bahawa campuran blok pejalan kaki dan sekam padi adalah paling ringan berbanding blok pejalan kaki (1:2:3) dan campuran blok pejalan kaki dan sabut kelapa.

Jadual 3. Analisa berat

Bil	Jenis Blok Pejalan Kaki	Keputusan Berat Bata (kg) (sebelum direndam)	Keputusan Berat Bata (kg) (7 hari)	Keputusan Berat Bata (kg) (14 hari)	Keputusan Berat Bata (kg) (28 hari)
1	Blok pejalan kaki (1:2:3)	8.0	7.4	7.2	7.3
2	Blok pejalan kaki + Sekam Padi	7.2	6.8	6.5	6.8
3	Blok pejalan kaki + Sabut Kelapa	7.8	7.6	7.4	7.6

Hasil daripada ujian kekuatan mampatan didapati campuran blok pejalan kaki campuran sabut kelapa lebih kuat berbanding dengan blok pejalan kaki (1:2:3) dan campuran blok pejalan kaki dan sekam padi. Keputusan ujian bagi campuran sabut kelapa ialah 15.8 MPa manakala blok pejalan kaki (1:2:3) adalah 11.6 MPa dan bagi campuran sekam padi ialah 3 MPa. Walaupun pengujian berat menunjukkan blok pejalan kaki campuran sekam padi adalah paling ringan namun kekuatan ujian mampatan bagi blok pejalan kaki campuran sabut kelapa adalah paling tinggi.

Jadual 4. Analisa ujian mampatan

Bil	Jenis Blok Pejalan Kaki	Keputusan Ujian Mampatan (MPa) (7 hari)	Keputusan Ujian Mampatan (MPa) (14 hari)	Keputusan Ujian Mampatan (MPa) (28 hari)
1	Blok pejalan kaki (1:2:3)	11.2	8.4	11.6
2	Blok pejalan kaki campuran sekam padi	4.6	4.4	3.7
3	Blok pejalan kaki campuran sabut kelapa	12.9	13.6	15.8

Satu pengujian visual dilakukan untuk menguji sama ada bahan blok pejalan kaki ini mampu bercahaya dengan sendirinya pada waktu malam atau tempat yang gelap. Jadual 4.5 menunjukkan hasil keputusan Analisa visual. Didapati sampel yang menggunakan *Luminescent paint* lebih terang berbanding *Luminescent stone* dan *Luminescent Powder.*

Jadual 5. Analisa visual

Bil	Jenis Blok Pejalan Kaki	Gambar
1	Blok pejalan kaki dan *luminescent powder*	
2	Blok pejalan kaki dan *luminescent stone*	3	Blok pejalan kaki dan *luminescent paint*	
4. Kesimpulan

Objektif pertama adalah untuk menghasilkan blok laluan pejalan kaki yang bercahaya '*glow in the dark*' pada waktu malam. Objektif pertama ini tercapai dengan penggunaan *luminuous powder*, *luminuous stone* dan *luminous paint dan* produk dilihat bercahaya dengan hasil ujian mendapati *luminuous stone* dan *luminuous paint* memberikan pencahayaan yang lebih terang berbanding *luminuous powder*. Objektif kedua adalah untuk menghasilkan blok laluan pejalan kaki yang menggunakan bahan kitar semula iaitu sabut kelapa atau sekam padi. Objektif kedua tercapai dengan menggantikan 20% sabut kelapa dalam penggunaan simen. Daripada penggantian 20% sabut kelapa dalam penghasilan blok pejalan kaki ini juga dapat meningkatkan daya mampatan blok pejalan kaki iaitu 15.8 MPa lebih tinggi berbanding blok pejalan kaki sedia ada dipasaran iaitu 11.6 MPa. Sepanjang proses penghasilan produk dan ujian yang telah dijalankan, didapati bahawa masih terdapat beberapa ruang untuk penambahbaikan untuk meningkatkan produktiviti dan kualiti produk. Beberapa cadangan untuk penambahbaikan produk yang dibuat untuk menyelesaikan masalah yang timbul dan pada masa yang sama menghasilkan produk berkualiti yang lebih baik pada masa akan datang. Terdapat beberapa langkah yang disyorkan yang boleh diambil untuk melaksanakan cadangan iaitu dengan mengkaji cara yang sesuai agar blok luminous ini tahan terhadap cuaca, mengekalkan kecerahan dan estetika pada jangka waktu yang lama. Selain itu, mempelbagaikan penggunaan bahan luminous dan juga bahan kitar semula bukan hanya pada blok konkrit.

Abstrak

Perengkuh paip dan spanar merupakan peralatan yang digunakan secara meluas di seluruh dunia dalam kerja-kerja perpaipan. Namun begitu, kebanyakan peralatan ini masih kurang menitikberatkan aspek keselamatan dan kesihatan dari sudut ergonomik, sedangkan faktor ini amat penting kerana boleh memberi kesan langsung terhadap postur badan serta keselesaan pengguna. Oleh itu, penghasilan Perengkuh Paip Ergonomik (PPE) ini bertujuan untuk membuat perbandingan dari segi tempoh masa penggunaan antara spanar konvensional dengan PPE, selain menilai tahap keberkesanan PPE dalam meningkatkan kecekapan dan keselamatan kerja-kerja perpaipan. Antara kelebihan PPE ini adalah meningkatkan keberkesanan kerja, meminimumkan masa yang diperlukan untuk menyelesaikan tugas, meningkatkan kebolehkerjaan, serta menjamin keselamatan dan keselesaan pengguna sepanjang tempoh penggunaan. Kajian ini menggunakan instrumen soal selidik yang melibatkan 50 orang responden terdiri daripada tukang paip berpengalaman dan juga orang awam. Hasil kajian mendapati bahawa PPE yang direka bentuk dengan saiz yang lebih kecil, ringan, mudah dikendalikan dan bersifat mesra pengguna dapat memberi impak positif terhadap prestasi kerja. Dapatan turut menunjukkan bahawa masa penggunaan PPE adalah jauh lebih singkat, iaitu 21.61 saat berbanding spanar boleh laras konvensional yang mencatatkan masa 107.66 saat. Dari aspek tahap keberkesanan pula, skor min sebanyak 4.69 diperoleh, sekali gus membuktikan bahawa PPE ini berupaya membantu kerja-kerja perpaipan dengan lebih efisien. Selain itu, ia juga mudah digunakan di pelbagai sudut dan posisi, dapat mengurangkan risiko kecederaan, memendekkan tempoh masa bekerja serta tidak memerlukan penggunaan tenaga kerja yang ramai. Secara keseluruhannya, inovasi PPE ini berpotensi besar dalam meningkatkan produktiviti serta menjaga aspek keselamatan dan kesihatan pengguna, selaras dengan keperluan ergonomik semasa.
Kata kunci: Perengkuh paip; Ergonomik; Keberkesanan kerja perpaipan.

1. Pengenalan

Kebanyakan rumah, bangunan atau di tandas-tandas awam mempunyai sinki yang menggunakan paip boleh lentur (*flexible hose*). Paip seperti ini tidak memerlukan pemotongan dan pengukuran paip kerana ia adalah paip yang boleh dilentur. Paip seperti ini biasanya digunakan untuk membuat penyambungan di tempat yang sempit dan mempunyai ruang yang amat terhad. Rajah 1 menunjukkan paip boleh lentur. Di antara ciri-ciri paip boleh lentur adalah seperti berikut i) Mempunyai saiz nat yang menepati piawaian standard ii)Bersifat fleksibel dan mudah dilentur mengikut keperluan iii) Memudahkan proses pemasangan, terutamanya di ruang sempit iv) Tidak memerlukan proses pemotongan semasa pemasangan.

Rajah 1. Paip boleh lentur

Pemasangan paip boleh lentur pada ruang yang sempit dan terhad memerlukan alatan tangan perpaipan yang khas. Contoh-contoh alatan tangan yang digunakan untuk pemasangan paip adalah seperti Rajah 2.

Rajah 2. a) Spanar boleh laras b) Perengkuh paip c) Spanar gabung

PPE ini telah direka bentuk oleh penyelidik dengan tujuan untuk memudahkan pengguna yang terlibat dalam aktiviti pemasangan atau penyelenggaraan sistem perpaipan. Alat ini sesuai digunakan khususnya dalam kerja-kerja perpaipan di kawasan kediaman atau bangunan, terutamanya pada sambungan paip boleh lentur seperti di bahagian sinki atau ruang sempit yang sukar dicapai. Selain itu, penggunaan PPE ini juga berpotensi untuk mengurangkan tempoh masa yang diperlukan dalam penyempurnaan tugasan berkaitan perpaipan. Secara umumnya, ergonomik merujuk kepada cabang ilmu yang mengaplikasikan pengetahuan tentang tingkah laku manusia, had keupayaan serta ciri-ciri fisiologi untuk tujuan mereka bentuk peralatan, sistem, tugas atau ruang kerja supaya lebih selamat, efisien, selesa dan mesra pengguna.

Menurut Chapanis (1985), terdapat dua matlamat utama dalam prinsip ergonomik. Pertama adalah untuk meningkatkan keberkesanan, kecekapan serta keselamatan ketika melakukan sesuatu tugas, termasuk mengurangkan ralat dan meningkatkan produktiviti. Matlamat kedua pula adalah untuk memenuhi keperluan manusia dari aspek keselamatan, keselesaan, mengurangkan keletihan, mengawal tekanan, serta meningkatkan tahap kepuasan bekerja dan kualiti hidup individu. Secara amnya, golongan tukang paip sering berdepan dengan kesukaran apabila berlaku kebocoran pada paip boleh lentur (*flexible hose*) yang dipasang di bahagian sinki dan memerlukan penyelenggaraan. Antara cabaran utama adalah ruang penyambungan yang sempit, sekali gus menyukarkan proses baik pulih. Situasi ini bukan sahaja meningkatkan risiko kecederaan kepada pekerja, malah turut memanjangkan tempoh pembaikan kerana mereka perlu bekerja dalam posisi tidak ergonomik seperti meniarap, merangkak atau berbaring. Selain itu, penggunaan spanar konvensional yang bersaiz besar menyukarkan operasi penyelenggaraan, khususnya di ruang kerja yang terhad dan sukar dicapai. Sehubungan itu, kajian ini turut memperkenalkan pembangunan PPE yang direka bentuk lebih mesra pengguna, praktikal dan sesuai digunakan di kawasan sempit. Di samping itu, kajian ini juga bertujuan untuk membuat perbandingan dari segi tempoh masa penggunaan antara spanar konvensional dengan PPE, selain menilai tahap keberkesanan PPE dalam meningkatkan kecekapan dan keselamatan kerja-kerja perpaipan.

2. Metodologi Kajian

Kajian ini menggunakan gabungan kaedah persampelan berkelompok dan persampelan rawak mudah bagi mendapatkan data yang bersifat menyeluruh dan mewakili populasi sasaran. Melalui kaedah persampelan berkelompok, responden terdiri daripada kumpulan tukang paip yang berpengalaman dalam kerja-kerja perpaipan. Pemilihan secara berkelompok ini membolehkan penyelidik memfokuskan kepada golongan pengguna yang mempunyai kepakaran teknikal serta pengalaman praktikal dalam penggunaan peralatan paip. Sementara itu, kaedah persampelan rawak mudah diaplikasikan bagi memilih responden dalam kalangan orang awam, di mana setiap individu mempunyai peluang yang sama untuk dipilih tanpa mengira latar belakang. Kaedah ini memastikan keterwakilan pandangan daripada pengguna biasa yang juga terlibat dalam penggunaan produk berkaitan perpaipan di kediaman atau premis mereka. Kedua-dua kategori responden ini dipilih kerana mereka merupakan pengguna utama peralatan perpaipan, sama ada secara profesional mahupun untuk kegunaan

harian. Sebanyak 50 set soal selidik diedarkan kepada responden yang telah menjalankan ujian ke atas prototaip PPE. Pendekatan ini membolehkan penyelidik memperoleh data empirikal yang holistik serta menilai tahap keberkesanan dan kebolehgunaan PPE daripada perspektif pengguna berbeza latar belakang.

Soal selidik dalam kajian ini dibangunkan selaras dengan objektif kajian. Antara aspek yang diterapkan dalam item soal selidik termasuk tempoh masa pengendalian PPE serta tahap keberkesanan produk tersebut. Bagi mengukur tahap persetujuan responden terhadap setiap item, skala Likert telah digunakan. Instrumen soal selidik ini dibahagikan kepada dua bahagian. Bahagian A mengandungi empat item soalan yang bertujuan untuk mengumpul maklumat demografi responden seperti jantina, umur, bangsa dan jenis pekerjaan. Sementara itu, Bahagian B terdiri daripada lima item soalan yang memfokuskan kepada penilaian tahap keberkesanan penggunaan PPE berdasarkan pengalaman responden. Jadual 1 memperincikan bilangan item soal selidik mengikut setiap bahagian. Bagi Bahagian B, responden diminta untuk menyatakan tahap persetujuan mereka terhadap pernyataan yang diberikan menggunakan skala Likert. Susun atur dan definisi bagi setiap tahap dalam skala Likert ditunjukkan dalam Jadual 2. Manakala Jadual 3 menunjukkan tahap skor min.

Jadual 1. Jumlah item mengikut bahagian

Bahagian	Item	Jumlah Item
A	Demografi	4
B	Keberkesanan Produk	5

Jadual 2. Skala Likert

Skala	Aras Persetujuan	Tahap
1	Sangat Tidak Setuju	Tidak Setuju
2	Tidak Setuju	
3	Kurang Setuju	Kurang setuju
4	Setuju	Setuju
5	Sangat setuju	

(Sumber: Adaptasi Piaw, C. W, 2006)

Jadual 3. Tahap skor min

Tahap	Skor Min
Rendah	1.00 - 2.33
Sederhana	2.34 - 3.66
Tinggi	3.67 - 5.00

(Sumber: Adaptasi Chua, Y. P, 2014)

3. Dapatan dan Perbincangan

Data yang diperoleh, dianalisis dengan menggunakan skor min. Huraian analisis data dibahagikan kepada dua bahagian utama iaitu:

3.1 Demografi

Profil demografi responden meliputi maklumat berkaitan jantina, umur, bangsa dan jenis pekerjaan. Data demografi yang dikumpulkan dianalisis bagi memperoleh taburan kekerapan dan peratusan, tanpa melibatkan analisis mendalam yang lain. Seramai 50 orang responden terlibat dalam kajian ini.

Jadual 4. Responden berdasarkan jantina

Bil	Jantina	Kekerapan	Peratus
1	Lelaki	45	90
2	Perempuan	5	10
	Jumlah	50	100

Seperti yang ditunjukkan dalam Jadual 4, seramai 45 orang responden adalah lelaki, mewakili 90% daripada keseluruhan sampel. Manakala, responden perempuan pula adalah seramai 5 orang, iaitu bersamaan dengan 10% daripada jumlah keseluruhan responden.

3.2 Umur

Jadual 5 memperincikan taburan responden mengikut kategori umur. Umur responden telah diklasifikasikan kepada tiga kumpulan utama. Hasil kajian menunjukkan bahawa majoriti responden, iaitu seramai 38 orang (76%), berada dalam lingkungan umur 21 hingga 30 tahun. Seterusnya, seramai 8 orang responden (16%) berada dalam kategori umur 31 hingga 40 tahun. Manakala 4 orang responden atau 8% terdiri daripada kumpulan umur 41 hingga 50 tahun.

Jadual 5. Responden berdasarkan umur

Bil	Umur	Kekerapan	Peratus
1	21 – 30 Tahun	38	76
2	31 – 40 Tahun	8	16
3	41 – 50 Tahun	4	8
	Jumlah	50	100

3.3 Bangsa

Jadual 6 menunjukkan taburan responden mengikut kategori bangsa. Hasil kajian mendapati majoriti responden adalah daripada kaum Melayu, iaitu seramai 84% daripada keseluruhan sampel. Sementara itu, responden berbangsa Cina mewakili 10%, manakala responden berbangsa India adalah sebanyak 6%.

Jadual 6. Responden berdasarkan bangsa

Bil	Bangsa	Kekerapan	Peratus
1	Melayu	42	84
2	Cina	5	10
3	India	3	6
	Jumlah	50	100

3.4 Jenis Pekerjaan

Jadual 7 menunjukkan bahawa majoriti responden adalah terdiri daripada pelajar, iaitu sebanyak 44% daripada keseluruhan responden. Selain itu, terdapat juga pelatih industri dari Institut Kemahiran Mara (IKM) dan kontraktor binaan, masing-masing mewakili 8%. Responden lain terdiri daripada juruteknik Mydin (8%), pelatih industri dari Politeknik (6%), pekerja kedai perkakasan (6%), juruteknik IPG (4%), operator (4%) serta tukang paip di IPG sebanyak 4%. Manakala selebihnya, iaitu masing-masing mewakili 2%, terdiri daripada nelayan, pembantu pegawai teknikal, anggota polis dan individu yang bekerja sendiri.

Jadual 7. Responden berdasarkan jenis pekerjaan

Bil	Pekerjaan	Kekerapan	Peratus
1	Juruteknik (IPG)	2	4.0
2	Juruteknik Mydin	4	8.0
3	Nelayan	1	2.0
4	Operator	2	4.0
5	Pelajar	22	44.0
6	Pelatih Industri (IKM)	4	8.0
7	Pelatih Industri (Politeknik)	3	6.0
8	Pem. Pegawai Teknik	1	2.0
9	Kontraktor Binaan	4	8.0
10	Polis	1	2.0

11	Pekerja kedai *hardware*	3	6.0
12	Tukang Paip (IPG)	2	4.0
13	Sendiri	1	2.0
	Jumlah	50	100.0

3.5 Tempoh Masa Penggunaan Spanar Boleh Laras dan Perengkuh Paip Ergonomik

Objektif pertama kajian adalah untuk membandingkan tempoh masa yang diambil bagi melaksanakan kerja-kerja perpaipan, terutamanya kerja yang melibatkan kawasan atau ruang yang sempit. Hal ini kerana penggunaan perengkuh paip dan spanar biasa sering kali menyukarkan kerja di kawasan berhalangan, sekali gus menyebabkan tempoh masa untuk menyiapkan kerja perpaipan menjadi lebih panjang. Berdasarkan ujian masa yang telah dijalankan ke atas penggunaan PPE dan spanar biasa dalam kerja-kerja perpaipan, hasilnya jelas menunjukkan bahawa PPE memerlukan masa yang lebih singkat berbanding spanar biasa. Jadual 8 memaparkan perbezaan tempoh masa antara PPE dan spanar boleh laras. Dapatan ini membuktikan bahawa PPE lebih praktikal dan mudah digunakan berbanding alatan sedia ada, khususnya untuk kerja perpaipan di ruang sempit atau sukar diakses.

Jadual 8. Keputusan ujian masa di antara spanar dan perengkuh paip ergonomik (PPE)

Peralatan	Perengkuh Paip Ergonomik	Spanar Boleh Laras
Masa yang diambil membuka paip boleh lentur *flexible hose* di sinki	21.61 saat	107.66 saat

3.6 Tahap Keberkesanan Perengkuh Paip Ergonomik

Objektif kedua kajian adalah untuk mengenal pasti tahap keberkesanan penggunaan perengkuh paip ergonomik dalam kerja-kerja perpaipan. Reka bentuk perengkuh paip yang ditambah baik dengan ciri-ciri ergonomik dapat membantu pengguna menjalankan kerja perpaipan dengan lebih mudah, terutamanya di kawasan yang sempit. Selain itu, penggunaan perengkuh ini juga berupaya mengurangkan risiko kecederaan dalam kalangan pengguna. Di samping itu, penggunaan tenaga fizikal dapat diminimumkan kerana perengkuh paip ergonomik direka untuk memendekkan masa membuka atau mengetatkan bolt dan nat, sekali gus meningkatkan kecekapan kerja. Jadual 9 memaparkan keseluruhan skor min yang diperoleh hasil daripada analisis kajian ini. Sebanyak lima item telah dibangunkan bagi menilai tahap keberkesanan penggunaan PPE. Penilaian dilakukan berdasarkan maklum balas responden terhadap item-item tersebut untuk menentukan nilai skor min masing-masing. Berdasarkan keputusan analisis, tahap keberkesanan penggunaan perengkuh paip ergonomik ditentukan menerusi kategori tahap kecenderungan min.

Jadual 9. Kadar skor min bagi keberkesanan penggunaan perengkuh paip ergonomik

Bil.	Item	Skor min	Tahap
1	Produk PPE ini memudahkan pelaksanaan kerja-kerja perpaipan	4.80	Tinggi
2	Produk ini mudah digunakan di pelbagai sudut atau posisi kerja	4.66	Tinggi
3	Produk ini mudah digunakan di kawasan kerja yang sempit dan terhad	4.80	Tinggi
4	Alat perengkuh paip ergonomik ini membantu mengurangkan risiko kecederaan semasa menjalankan kerja di kawasan sempit	4.58	Tinggi
5	Penggunaan perengkuh paip ergonomik ini dapat memendekkan masa kerja perpaipan	4.60	Tinggi
	Nilai Purata Skor Min		4.69

Secara keseluruhannya, dapatan kajian menunjukkan purata skor min bagi tahap keberkesanan penggunaan PPE adalah 4.69, yang berada dalam kategori tahap tinggi. Keupayaan produk ini untuk berfungsi dengan efektif dalam pelbagai posisi menjadikannya

lebih fleksibel dan sesuai digunakan di lokasi kerja yang berbeza. Selain itu, dalam situasi ruang kerja yang sempit dan terhad, produk ini turut menunjukkan prestasi cemerlang dengan skor min sebanyak 4.80. Dari sudut keselamatan, hasil kajian mendapati penggunaan perengkuh paip ergonomik berpotensi mengurangkan risiko kecederaan ketika menjalankan kerja di kawasan yang terhad, dengan nilai min direkodkan sebanyak 4.58. Secara tidak langsung, ini membuktikan bahawa produk ini bukan sahaja dapat meningkatkan kecekapan kerja, malah memberi penekanan terhadap aspek keselamatan pengguna, khususnya dalam persekitaran kerja yang mencabar. Di samping itu, antara kelebihan utama perengkuh paip ergonomik ini adalah keupayaannya memendekkan tempoh masa kerja perpaipan, sebagaimana ditunjukkan oleh skor min 4.60. Keupayaan ini membantu pengguna melaksanakan tugasan dengan lebih cepat dan efisien, sekali gus meningkatkan tahap produktiviti kerja secara keseluruhan.

4. Kesimpulan

Perbincangan keputusan kajian ini dibuat selari dengan objektif yang telah ditetapkan. Objektif pertama adalah untuk membandingkan tempoh masa penggunaan PPE dengan spanar boleh laras dalam kerja-kerja pemasangan atau penggantian paip boleh lentur (*flexible hose*). Ujian masa telah dijalankan bagi memenuhi objektif tersebut. Hasil ujian menunjukkan penggunaan spanar memerlukan purata masa sebanyak 107.66 saat untuk menyiapkan tugas tersebut. Sebaliknya, apabila menggunakan PPE, masa yang diambil adalah jauh lebih singkat iaitu hanya sekitar 21.61 saat. Ini jelas membuktikan bahawa PPE dapat membantu mempercepatkan kerja perpaipan berbanding penggunaan spanar biasa. Bagi objektif kedua, kajian ini menilai tahap keberkesanan penggunaan PPE dalam kerja-kerja perpaipan yang melibatkan paip boleh lentur. Hasil soal selidik mendapati rata-rata responden bersetuju bahawa PPE memudahkan kerja mereka, khususnya di kawasan yang sempit atau sukar diakses. Nilai skor min yang dicatatkan adalah 4.80, menunjukkan tahap keberkesanan yang tinggi. Dapatan ini menunjukkan bahawa PPE berpotensi menyelesaikan masalah keterbatasan ruang serta meningkatkan kecekapan kerja di lapangan. Secara keseluruhan, kajian ini menunjukkan bahawa penggunaan Perengkuh Paip Ergonomik bukan sahaja dapat mempercepatkan kerja, malah turut meningkatkan aspek keselamatan dan kemudahan pengguna. Dengan kelebihan tersebut, PPE amat disarankan untuk digunakan dalam sektor perpaipan, terutamanya bagi kerja-kerja yang melibatkan ruang kerja yang terhad atau memerlukan kedudukan badan yang tidak selesa.

THE INFLUENCE OF PRICE AND SERVICE QUALITY ON CONSUMER PURCHASE DECISIONS AT GERAI HANIA ONLINE STORE IN MEDAN CITY

Fitri Amalia Nst*, Cece Cece

Management Department, School of Management Studies, 20219 Medan, North Sumatra, Indonesia

*Corresponding author e-mail address: fitrinst512@gmail.com

Abstract

This research aims to analyse the influence of price and service quality on consumer purchasing decisions at the Gerai Hania online store in Medan. The study employs a quantitative approach, utilising a multiple linear regression analysis method. Data were collected through questionnaires distributed to 90 consumers who had made purchases at the store. The variables studied include price and service quality as independent variables and purchasing decision as the dependent variable. The results indicate that both price and service quality have a significant positive impact on purchasing decisions, acting both partially and simultaneously. The coefficient of determination (R^2) demonstrates that the two independent variables can explain 86.7% of the variation in purchasing decisions. Among these factors, service quality is the most significant factor influencing purchasing decisions, as indicated by the highest standardised coefficient (Beta). These findings underscore the importance of competitive pricing and high-quality service in enhancing consumer interest and satisfaction in online retail settings. This study offers valuable insights for online business owners seeking to enhance customer acquisition and retention strategies through targeted pricing and service enhancements.
Keywords: Price; Service quality; Purchasing decision.

1. Introduction

The rapid development of information and communication technology in recent years has brought about fundamental changes in consumer behaviour patterns, including in the city of Medan. This digital transformation has driven a shift from conventional transactions to online transactions, enabling consumers to purchase products or services without the need for physical presence in stores. Various e-commerce platforms and online shops have emerged, offering convenience, time efficiency, and practicality in the shopping process. Gerai Hania is one of the businesses that has taken advantage of this opportunity. This online store, specialising in women's and children's clothing, is located on Jl. Alfalah No.13 B, Suka Maju Subdistrict, Medan Johor District, Medan City, North Sumatra 20146. Established in early 2020 by a young couple who recognised the growing trend of online shopping during the COVID-19 pandemic, Gerai Hania initially marketed its products through a personal Instagram account with a limited collection. However, due to positive market responses, the store gradually expanded its marketing channels to TikTok and Shopee, actively using these platforms to promote content and facilitate sales transactions. In addition to its online presence, Gerai Hania also offers offline purchasing services at the same location, providing an alternative for customers who prefer to view the products in person.

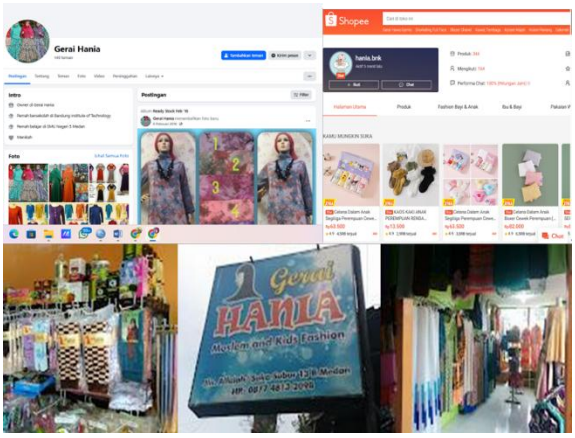

Fig. 1. Overview of Gerai Hania's offline and online storefront

The products offered by Gerai Hania include a variety of women's and children's clothing, such as dresses, blouses, long dresses (*gamis*), sleepwear, and daily kids' outfits. All products are carefully selected in accordance with current fashion trends, while maintaining affordable prices for the middle-income consumer segment. A competitive pricing strategy is one of Gerai Hania's key advantages, supported by efforts to provide comfortable and prompt service, both in communication and product delivery.

However, as the business has grown, Gerai Hania has encountered several challenges, particularly in maintaining the quality of its customer service. Based on initial observations and internal sales data, it was found that monthly transaction volumes fluctuate and do not always correspond with the number of visits to the store's online pages. This indicates a gap between initial consumer interest and final purchasing decisions. Some customers have also provided feedback regarding slow response times and incomplete product information. With increasing competition in the online fashion industry, enhancing customer service has become crucial for maintaining the store's reputation and fostering customer loyalty.

In the context of online stores, consumer purchasing decisions represent a critical stage influenced by various factors. The purchase decision process involves a series of steps, starting from need recognition, information search, evaluation of alternatives, purchase decision, and post-purchase behaviour. Throughout this process, consumers consider the available information about the product, pricing, reviews from other customers, transaction security, and their previous shopping experiences. (Devi & Fadli, 2023; Zahira & Salamah, 2022).

Previous studies have shown that online purchasing decisions are influenced strongly by competitive pricing and high-quality service. A survey by Zubaidah and Latief (Devi & Fadli, 2023) revealed that factors such as discount promotions, free shipping, price, and product quality significantly affect consumer purchasing decisions on Shopee. Meanwhile, research conducted by Ghoni and Soliha (Dika Juliantari & Prawitasari, 2025) as well as Hermansyah et al. found that brand image, customer reviews, service quality, and price have a significant influence on purchase decisions (Hardianawati et al., 2024).
In this context, competitive and transparent pricing not only reflects the value of the product but also represents consumer trust in the store (Kotler & Keller, 2021). A study by Ulfah, Fadilah, and Fadli emphasises that prices aligned with consumers' perceived value can significantly drive purchasing decisions (Devi & Fadli, 2023; Fadilah et al., 2023; Ulfah, 2023). Meanwhile, service quality which includes response speed, clarity of product information, delivery reliability, transaction security, and friendly communication has been proven to contribute to customer satisfaction and loyalty directly. Research conducted by Marbun, Antoni, and Faradila demonstrates that excellent service can encourage repeat purchases

and strengthen consumer loyalty (Faradila et al., 2024; Marbun, 2022; Nufal & Kuswinarno, 2024).

As the store continues to grow, Gerai Hania has established a substantial customer base in Medan and its surrounding areas. Daily visits to the store's accounts and consumer interactions have increased significantly, especially during promotional events or seasonal discounts. The business has also created employment opportunities for additional staff, such as social media administrators, packaging teams, and customer service personnel. In navigating the rapidly evolving online market, Gerai Hania must gain a deep understanding of how price and service quality influence consumer purchasing decisions. An accurate understanding of the factors influencing purchase decisions will serve as a foundation for formulating more effective and relevant marketing strategies, thereby enhancing competitive advantage in the increasingly intense online fashion industry. Theoretically, the relationship between the variables Price (X1), Service Quality (X2), and Purchase Decision (Y) can be illustrated through a conceptual framework:

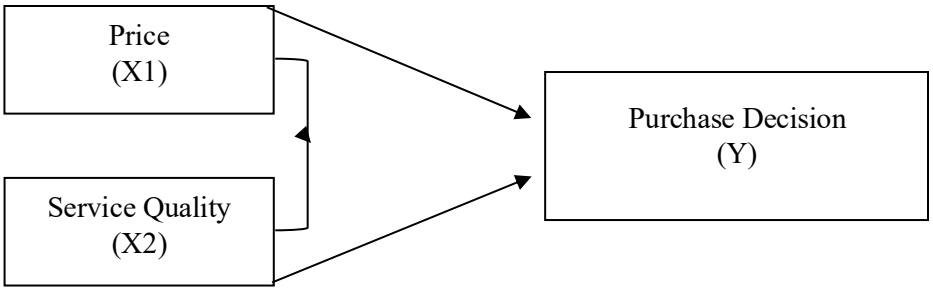

Fig. 2. Theoretical Framework

Based on the aforementioned explanation, the research hypotheses are formulated as follows:

H^1: Price has a positive and significant effect on consumer purchase decisions at the Gerai Hania online store in Medan City.

H^2: Service quality has a positive and significant effect on consumer purchase decisions at the Gerai Hania online store in Medan City.

H^3: Price and service quality simultaneously have a positive and significant effect on consumer purchase decisions at the Gerai Hania online store in Medan City.

Thus, this study is expected to provide both theoretical and practical contributions, as well as serve as a reference for Gerai Hania in formulating data-driven marketing strategies to enhance competitive advantage and customer satisfaction.

2. Methodology

This study involved customers of Gerai Hania Online Store, located at Jl. Alfalah No.13 B, Suka Maju Subdistrict, Medan Johor District, Medan City, North Sumatra, 20146. Gerai Hania specializes in selling women's and children's clothing through various digital platforms, including Instagram, TikTok, and Shopee, as well as operating a physical storefront. The study's target population included all customers who made purchases between November 2024 and March 2025, during which the store averaged 173 transactions per month. Using Slovin's formula and a 10% margin of error, the study determined a sample size of 90 respondents. Participants were selected based on the criterion that they had completed at least two purchases. This sampling method ensured the inclusion of informed and experienced customers, thereby improving the validity of the findings related to the impact of pricing and service quality on purchasing decisions.

The research was conducted from March to June 2025. The initial stages included the submission of the research title and the preparation of the proposal, followed by data collection through online questionnaires and data analysis using SPSS Version 22. The questionnaires were distributed digitally to Gerai Hania customers who met the participation criteria. Before data collection, participants were informed about the purpose of the study and their consent was obtained voluntarily. The collected data were then coded, classified, and processed for statistical testing in accordance with the research objectives. Throughout the research process, ethical considerations such as confidentiality and data privacy were maintained to protect respondent identities.

The primary data in this study were obtained through an online questionnaire distributed via Google Forms: https://forms.gle/NYj4Dwh3w1Ft3c358. Secondary data were collected from relevant literature, including scholarly journals, books, articles, and supporting documentation. The questionnaire was structured to include 15 statement items distributed across three main variables: Price (X1), Service Quality (X2), and Purchase Decision (Y). Each item was measured using a 5-point Likert scale with response options ranging from 1 (Strongly Disagree) to 5 (Strongly Agree). This instrument was developed and refined based on existing literature and adapted to the research context of online consumers in Medan.

The operational definitions and indicators for each variable are as follows:

a. Price (X1) refers to the consumer's perception of the affordability, fairness, and attractiveness of product pricing. This variable was measured using 5 items related to:
    1. Price affordability
    2. Satisfaction with price relative to quality
    3. Price attractiveness compared to competitors.
    4. Influence of promotions or discounts
    5. Price transparency
b. Service Quality (X2), Defined as the perceived quality of service provided during the online shopping experience, including interaction and platform usability. Measured with 5 items covering:
    1. Product conformity with description
    2. Admin responsiveness
    3. Transaction safety and trust
    4. Friendliness of service
    5. Interface appearance and ease of navigation of the online store

c. Purchase Decision (Y), Refers to the customer's final decision to buy a product based on evaluation of product, price, and service quality. Measured with 5 items focusing on:
    1. Product suitability with consumer needs
    2. Information seeking before purchase.
    3. Comparison with other stores
    4. Consideration of price and quality
    5. Purchase satisfaction and repurchase intention.

Before full-scale data collection, the questionnaire was reviewed to ensure clarity of statements and consistency with research objectives. A pilot test was also conducted to assess internal reliability and refine wording where necessary. The data collected through questionnaires were analysed using SPSS version 22. A series of analytical procedures was applied to ensure that the data were valid, reliable, and met the classical assumptions necessary for conducting multiple linear regression analysis. The steps are as follows:

1. Validity Test: The purpose of this test is to ensure that each item in the questionnaire accurately measures the intended construct. The validity was assessed using the Corrected Item-Total Correlation, where a correlation coefficient greater than 0.30 indicates that the item is valid.

2. Reliability Test: This test measures the internal consistency of questionnaire items using Cronbach's Alpha. A value of α ≥ 0.70 indicates that the instrument is reliable.
3. Classical Assumption Tests: Prior to regression analysis, the dataset was tested for the following classical assumptions:
    a. Normality Test: Assesses whether the residuals are normally distributed, evaluated through Kolmogorov–Smirnov and Q–Q Plot analysis.
    b. Multicollinearity Test: Detects the presence of high correlation among independent variables. The model is considered free from multicollinearity if Tolerance > 0.10 and VIF < 10.
    c. Heteroscedasticity Test: Detects unequal variances of residuals. The absence of heteroscedasticity is confirmed if the scatterplot of residuals appears randomly distributed without a discernible pattern.
4. Coefficient of Determination (R^2): This test examines the proportion of variation in the dependent variable (Purchase Decision) explained by the independent variables (Price and Service Quality).
5. Partial Test (t-test): This test is used to determine the individual influence of each independent variable on the dependent variable. It shows whether Price and Service Quality have a statistically significant impact when considered separately.
6. Simultaneous Test (F-test): This test evaluates whether Price and Service Quality together have a statistically significant effect on the Purchase Decision.
7. Multiple Linear Regression Analysis: This analysis is used to assess both the simultaneous and partial effects of Price (X_1) and Service Quality (X_2) on Purchase Decision (Y). It determines how each independent variable influences the dependent variable while controlling for the other. The regression produces coefficient values that indicate the direction and strength of the relationship, as well as the coefficient of determination (R^2), which reflects the proportion of variance in the purchase decision explained by both variables. This method also supports hypothesis testing through t-tests (partial) and F-tests (simultaneous), allowing for a comprehensive evaluation of the model's predictive power.

Hypothesis testing was conducted at a significance level of α = 0.05 (5%)

a) If p-value ≤ 0.05, the alternative hypothesis (Ha) is accepted, indicating a statistically significant effect.
b) If p-value > 0.05, the null hypothesis (Ho) is accepted, indicating no statistically significant effect.

Additionally, for the t-test, significance is also confirmed if the t-statistic is equal to or greater than the t-table value. This analytical approach ensures that the findings are statistically valid and capable of accurately explaining the influence of Price and Service Quality on consumer Purchase Decisions at Gerai Hania Online Store in Medan.

3. Results and Discussion

This study conducted a descriptive analysis to understand the demographic background and purchasing preferences of consumers at Gerai Hania, an online store based in Medan, Indonesia. Data was collected through questionnaires distributed to 90 respondents, selected using the Slovin formula to ensure an accurate representation of the population. The population consisted of all customers who made purchases at Gerai Hania, which recorded an average of 173 transactions per month between November 2024 and March 2025. Since the exact number of unique customers was unknown and the population was relatively large, probability-based sampling was not feasible. The information gathered includes variables such as gender, age, education level, purchase frequency, source of information, preferred payment method, and the primary factors influencing purchasing decisions. All 90 questionnaires were fully completed and deemed valid for analysis, resulting in a 100%

response rate. Accordingly, both descriptive and inferential analyses were conducted based on this dataset, providing a representative insight into the characteristics and behaviour of Gerai Hania's consumer base.

Table 1. Respondent characteristics

No	Respondent Characteristic	Category	Frequency (n)	Percentage (%)
1	Age	< 20 years	10	11.10%
		20 – 25 years	64	71.10%
		26 – 30 years	5	5.60%
		31 – 35 years	6	6.70%
		> 35 years	5	5.60%
2	Gender	Male	33	36.70%
		Female	57	63.30%
3	Last Education Level	Senior High School (SMA/SMK)	57	63.30%
		Diploma	6	6.70%
		Undergraduate/Graduate/Postgraduate (S1/S2/S3)	27	30.00%
4	Purchase Frequency	Once	31	34.40%
		2–3 times	37	41.10%
		More than 3 times	22	24.40%
5	Source of Information	Instagram	27	30.00%
		TikTok	21	23.30%
		Friends/Family	42	46.70%
6	Payment Method	Cash on Delivery (COD)	45	50.00%
		E-wallet	22	24.40%
		Credit/Debit Card	7	7.80%
		Bank Transfer	16	17.80%
7	Main Factor Influencing Purchase	Service Quality	34	37.80%
		Product Price	19	21.10%
		Recommendations from Others	12	13.30%
		Combination (price, quality, promo, service)	25	27.80%

Based on Table 1, the respondent characteristics in this study reflect the demographic profile and purchasing behaviour of consumers at the Gerai Hania Online Store. These characteristics include age, gender, level of education, purchase frequency, source of information, payment method, and the main factors influencing purchase decisions. A detailed explanation of each characteristic is presented below:

a. Age Distribution
   The majority of respondents (71.10%) were aged between 20 and 25 years, indicating that Gerai Hania's customer base is dominated by young adults. Meanwhile, 11.10% were under 20 years old, and smaller proportions were found in the 26–30 (5.60%), 31–35 (6.70%), and over 35 years (5.60%) age groups. This suggests that the store primarily appeals to consumers in early adulthood, a group typically active in online shopping and responsive to digital marketing.
b. Gender
   Female respondents constituted a higher proportion (63.30%) compared to males (36.70%). This aligns with existing consumer behaviour studies, which show that

women tend to dominate in online retail, particularly in fashion, beauty, and lifestyle-related products.

c. Educational Background
   Most respondents (63.30%) completed senior high school (SMA/SMK), followed by 30.00% who held undergraduate or postgraduate degrees (S1/S2/S3), and 6.70% with diploma-level education. This reflects a consumer group with relatively broad educational backgrounds, with a significant portion being early stage working professionals or students.
d. Purchase Frequency
   In terms of purchase frequency, 41.10% of respondents had purchased 2–3 times from the store, while 34.40% had only purchased once, and 24.40% had made more than three purchases. This indicates a relatively high level of repeat purchases, which may suggest customer satisfaction or effective promotional strategies.
e. Source of Information
   When asked how they discovered the store, 46.70% cited recommendations from friends or family, 30.00% through Instagram, and 23.30% via TikTok. These findings highlight the role of word-of-mouth and social media, particularly Instagram, as primary marketing channels for attracting customers.
f. Payment Methods
   Cash on Delivery (COD) was the most preferred payment method (50.00%), followed by e-wallets (24.40%), bank transfers (17.80%), and credit/debit cards (7.80%). The dominance of COD suggests that trust and convenience remain important factors in online transactions for this market segment.
g. Main Factors Influencing Purchase Decisions
   Regarding the main factors influencing purchase decisions, 37.80% of respondents prioritised service quality, followed by price (21.10%), recommendations from others (13.30%), and a combination of factors (27.80%), including price, quality, promotions, and service. This implies that service excellence plays a crucial role in consumer decision-making, along with a balanced value proposition.

Overall, the respondent profile indicates that Gerai Hania's primary customers are young, digitally connected, and value-driven consumers who are sensitive to both service quality and peer influence. These insights are valuable for targeting and refining marketing strategies, as well as improving customer retention efforts. To evaluate the accuracy of each measurement item in representing its respective construct, a validity test was conducted using the Pearson product-moment correlation technique. This method assesses the degree to which each questionnaire item correlates with the total score of its variable, thereby determining whether the item is capable of validly measuring what it is intended to measure.

The test was performed at a significance level of $\alpha = 0.05$, with 90 respondents included in the analysis. Based on the degrees of freedom ($df = N - 2 = 88$), the critical R-value (r-table) was determined to be 0.2071. Any item with a correlation coefficient greater than 0.2071 and a p-value less than 0.05 is considered statistically valid. The validity test was applied to three key variables: Price (X_1), Service Quality (X_2), and Purchase Decision (Y), each of which was measured using five questionnaire items. The results of the validity test for each variable are detailed below:

Price (X_1) was measured through five indicators designed to capture consumer perceptions of pricing strategies, fairness, and value. The results of the validity test are presented in Table 2.

Table 2. Validity test results for price (X_1)

Item	Correlation Coefficient (r)	r-table	Decision
1	0.792	0.2071	Valid
2	0.869	0.2071	Valid
3	0.841	0.2071	Valid
4	0.796	0.2071	Valid
5	0.809	0.2071	Valid

As shown above, the correlation coefficients for all five items range from 0.792 to 0.869, which are significantly higher than the r-table value. This indicates a strong and consistent correlation between each item and the total score of the Price variable. Consequently, all items are considered valid and accurately reflect the construct they are intended to measure. Service Quality (X_2), The Service Quality variable was also assessed using five indicators that measured dimensions such as responsiveness, reliability, and customer satisfaction. The validity results are presented in Table 3.

Table 3. Validity test results for service quality (X_2)

Item	Correlation Coefficient (r)	r-table	Decision
1	0.834	0.2071	Valid
2	0.828	0.2071	Valid
3	0.784	0.2071	Valid
4	0.839	0.2071	Valid
5	0.836	0.2071	Valid

All items demonstrate correlation coefficients above the threshold, ranging from 0.784 to 0.839, with statistically significant p-values ($p < 0.05$). This confirms that each item effectively measures the Service Quality construct, making them all suitable for inclusion in further analysis. Purchase Decision (Y), To assess Purchase Decision, five indicators were used to capture the factors influencing consumers' decision-making processes, including intention, behaviour, and satisfaction. The results are provided in Table 4.

Table 4. Validity test results for purchase decision (Y)

Item	Correlation Coefficient (r)	r-table	Decision
1	0.828	0.2071	Valid
2	0.847	0.2071	Valid
3	0.769	0.2071	Valid
4	0.822	0.2071	Valid
5	0.83	0.2071	Valid

The correlation coefficients for this variable range from 0.769 to 0.847, which clearly exceeds the critical value. All p-values are also below 0.05, affirming that these items validly measure the intended construct. To evaluate the internal consistency of the research instrument, a reliability test was conducted using Cronbach's Alpha coefficient. This statistical measure is commonly employed to determine the extent to which items within a construct yield consistent results. A Cronbach's Alpha value of 0.70 or higher is generally accepted to indicate a high level of reliability, suggesting that the items collectively measure the same underlying construct with adequate consistency.

The reliability test in this study was performed on three key variables: Price (X_1), Service Quality (X_2), and Purchase Decision (Y). Each variable was measured using five questionnaire items. The results of the analysis are presented in Table 5.

Table 5. Reliability test results of research variables

Variable	Number of Items	Cronbach's Alpha	Decision
Price (X_1)	0.88	5	Reliable
Service Quality (X_2)	0.882	5	Reliable
Purchase Decision (Y)	0.877	5	Reliable

The results indicate that the Price variable obtained Cronbach's Alpha of 0.880, confirming strong internal consistency among the five items used to measure consumer perceptions related to pricing. The Service Quality variable showed a Cronbach's Alpha of 0.882, suggesting a high degree of reliability in the measurement of service-related factors such as responsiveness, accuracy, and customer satisfaction. The Purchase Decision variable achieved a Cronbach's Alpha of 0.877, indicating that the instrument used to assess consumer purchase behaviour is also highly reliable.

These findings demonstrate that all measurement instruments used in this study possess an acceptable level of reliability. Therefore, the items are considered suitable for further statistical analysis, including regression modelling and hypothesis testing, which depend on the internal consistency of the variables involved. To assess whether the data used in this study follow a normal distribution, a normality test was conducted using two approaches: the Shapiro–Wilk test, which is suitable for small to medium sample sizes, and a visual assessment using the Q–Q Plot. The assumption of normality is an essential prerequisite for conducting parametric tests, such as multiple linear regression.

Table 6. Normality test results

Variable	Kolmogorov–Smirnov Sig.	Shapiro–Wilk Sig.	Conclusion
Price (X_1)	0.009	0.200*	Normal
Service Quality (X_2)	0.004	0.057	Normal
Purchase Decision (Y)	0.002	0.094	Normal

The Shapiro–Wilk test results for all three variables show p-values greater than 0.05, indicating that the data are normally distributed and do not significantly deviate from the expected distribution. Even though the Kolmogorov–Smirnov test indicates lower p-values, the Shapiro–Wilk test is prioritised due to its higher sensitivity in small samples (N = 90). In addition to the statistical test, a Normal Q–Q Plot was examined to provide visual confirmation of normality. As shown in Fig. 2, the data points are closely aligned along the diagonal line, further supporting the conclusion that the residuals are normally distributed.

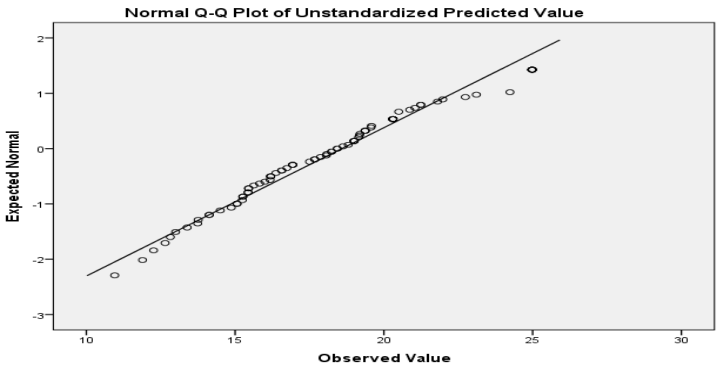

Fig.3. Normal Q–Q plot of unstandardized predicted values

The combination of statistical results and visual inspection confirms that the normality assumption has been satisfied, and thus the dataset is appropriate for further parametric analyses such as regression.

To identify multicollinearity between independent variables, the analysis used the Variance Inflation Factor (VIF) and Tolerance. The test results are summarised in Table 7.

Table 7. Multicollinearity T-test results

Variable	Tolerance	VIF	Conclusion
Price (X_1)	0.22	4.537	No multicollinearity
Service Quality (X_2)	0.22	4.537	No multicollinearity

Both variables show VIF values below 10 and Tolerance above 0.10, indicating no multicollinearity. Thus, the independent variables can be reliably used in the regression model. Heteroscedasticity was tested using a scatterplot of unstandardized residuals versus predicted values. As shown in Figure 4, the residuals are randomly dispersed without forming a specific pattern. This indicates that the assumption of homoscedasticity is met, and no heteroscedasticity is present in the model.

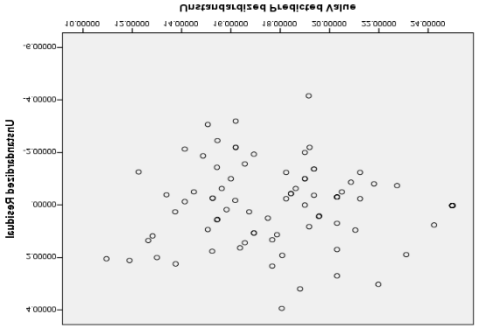

Fig.4. Scatterplot of unstandardized residuals

As shown in the scatterplot, the distribution of residuals appears to be randomly scattered around the horizontal axis, with no discernible pattern such as a funnel shape, curve, or systematic clustering. This indicates that the variance of the residuals remains relatively constant across all levels of the predicted values. Based on this visual inspection, it can be concluded that heteroscedasticity is not present in the model. Therefore, the assumption of homoscedasticity is satisfied, and the regression analysis can proceed without bias related to unequal variance of residuals. A multiple linear regression was conducted to evaluate the effect of Price (X_1) and Service Quality (X_2) on Purchase Decision (Y). The results are shown in the table below:

a) Model Summary

Table 8. Model Summary

No	Type of correlation	Correlation value
1	R	0.931
2	R^2	0.867
3	Adj R^2	0.864

The correlation coefficient (R) of 0.931 indicates a very strong positive relationship between the variables. The coefficient of determination (R^2) of 0.867 means that 86.7% of the variation in Purchase Decision can be explained by Price and Service Quality. The Adjusted R^2 value of 0.864 confirms the model's consistency, making it suitable for interpretation and further analysis.

b) Simultaneous Test (F-Test)

To test the simultaneous effect of Price (X_1) and Service Quality (X_2) on Purchase Decision (Y), an F-test was conducted through ANOVA analysis. The results are presented below:

Table 13. F-test results

	Model	Sum of Squares	df	Mean Square	F	Sig.
1	Regression	1237.665	2	618.833	283.176	0
	Residual	190.123	87	2.185		
	Total	1427.789	89			

a. Dependent Variable: Y_Total
b. Predictors: (Constant), X2_Total, X1_Total

At a significance level of α = 0.05, with $df_1 = 2$ and $df_2 = 87$, the F-table value is approximately 3.10. Since the computed F-value (283.176) is far greater than the F-table value and the p-value = 0.000 < 0.05, it can be concluded that the regression model is statistically significant. This indicates that both Price and Service Quality have a significant effect on the Purchase Decision simultaneously.

c) Partial Test (t-Test)

Table 14. T-test results

Variable	Coef. (B)	t-value	Sig.	t-table (df = 63)	Interpretation
Constant	1.773	1.843	0.070	1.987	Not significant
X_1 (Price)	0.327	4.606	0.000	1.987	Significant positive effect
X_2 (Service Quality)	0.265	3.555	0.001	1.987	Significant positive effect

At a significance level of α = 0.05 with df = 87, the critical t-table value is 1.987. Both independent variables meet the criteria for statistical significance, as their t-values exceed the t-table value and their p-values are less than 0.05. This confirms that both Price and Service Quality have a significant and positive influence on Purchase Decision, with Price (X_1) exerting a slightly stronger effect.

d) Regression Equation

Based on the multiple linear regression analysis, the regression equation that models the relationship between the independent variables—Price (X_1) and Service Quality (X_2)—and the dependent variable Purchase Decision (Y) is expressed as follows:

$$Y= 1.602+0.370X1+0.565X2+e \quad (1)$$

Where:
Y = Purchase Decision
X_1 = Price
X_2 = Service Quality
E = Error Term (at α = 0.05)

The results of the multiple linear regression analysis yielded the equation $Y = 1.602 + 0.370X_1 + 0.565X_2 + e$, indicating that when both Price (X_1) and Service Quality (X_2) are zero, the baseline level of Purchase Decision (Y) is 1.602. The coefficient for Price (0.370) suggests that each one-unit increase in price contributes to a 0.370-unit increase in purchase decision, while the coefficient for Service Quality (0.565) implies a 0.565-unit increase in purchase decision for every one-unit improvement in service quality, assuming other variables remain constant. Both variables have p-values of 0.000, which are below the 0.05 significance threshold, confirming that Price and Service Quality each have a statistically significant and positive influence on consumer purchase decisions at Gerai Hania Online Store.

The findings from the multiple linear regression analysis demonstrate that both Price (X_1) and Service Quality (X_2) significantly influence Purchase Decision (Y) among consumers of the

Gerai Hania online store. The regression model is statistically valid, as indicated by the ANOVA significance value of 0.000 ($p < 0.05$), and shows high explanatory power with an R^2 value of 0.867, indicating that 86.7% of the variation in purchase decisions can be explained by the two independent variables, while the remaining 13.3% is attributed to other factors not included in the model.

Partially, Price (X_1) has a positive and significant effect on purchase decisions, with a regression coefficient of 0.370 and a significance value of 0.000. This suggests that competitive pricing plays an important role in influencing consumer decisions, particularly in online markets where price comparisons are easily accessible. This result is consistent with the studies by Mita Soraya and Yoestini, as well as Zenada et al., which found that consumers tend to choose products that offer a balance between price and quality(Mita Soraya & Yoestini, 2024; Zenada et al., 2024). However, contrasting findings from Arisa and Wiranto and Amron (2024) indicate that in certain contexts, factors such as brand trust, product reviews, or promotional programs may have a stronger influence than price alone(Arisa, 2024; Wiranto & Amron, 2024).

Similarly, Service Quality (X_2) shows a significant positive influence on Purchase Decision, with a regression coefficient of 0.565 and a significance value of 0.000. This finding implies that improvements in service quality, such as responsive communication, accurate product information, delivery reliability, and effective return policies, can enhance customer satisfaction and increase the likelihood of purchase. These results are supported by the findings of Prihandoyo et al. and Muhtad, who emphasised that service excellence contributes significantly to purchase behaviour, particularly in the online shopping environment (Muhtadi, 2024; Prihandoyo et al., 2025). However, some studies, such as those by Humairoh and Riski, Sirait and Arjuna found that service quality did not significantly affect purchase decisions in some cases, as customers prioritised free shipping, discounts, or peer reviews over service interactions (Humairoh & Riski, 2024; Sirait & Arjuna, 2025).

Simultaneously, the combined effect of Price and Service Quality is confirmed through the F-test, with an F-value of 283.176 and a significance value of 0.000, demonstrating that these two variables together have a statistically significant impact on Purchase Decision. The high R^2 value supports the assertion that both price strategies and service performance are essential components in influencing consumer behaviour. These findings align with the research of Widianti and Langga, who stated that the synergy between pricing and service factors contributes to customer loyalty and repeat purchases(Langga, 2024; Widianti, 2024). However, alternative perspectives from Adinitasya and Sulastri argue that in some settings, brand awareness, product quality, and consumer trust may have greater simultaneous influence than price and service (Adinitasya & Sulastri, 2024).

Taken together, the findings confirm that price and service quality both play critical roles in shaping purchase decisions in the context of online retail. However, the extent of their influence may vary depending on consumer characteristics, product types, and market dynamics. It is therefore essential for online businesses to not only offer competitive prices and superior service but also to consider other strategic elements such as branding, user experience, and promotional effectiveness.

4. Conclusion

This study aimed to investigate the effect of Price and Service Quality on consumer Purchase Decisions in the context of an online retail store, Gerai Hania in Medan. Based on multiple linear regression analysis, the findings reveal that both Price and Service Quality have a significant and positive influence on purchase decisions, either partially or simultaneously. The R Square value of 0.867 indicates that these two variables can explain 86.7% of the variance in purchase decisions. The t-test results confirmed that Price (Sig. = 0.000) and Service Quality (Sig. = 0.000) are individually significant predictors, while the F-test result (Sig. = 0.000) supports their combined effect. These results contribute to the growing body of knowledge on consumer behaviour in digital commerce by reaffirming that competitive pricing and excellent service delivery are critical drivers of purchasing intent and decision-making. Practically, this suggests that online retailers should adopt a balanced strategy by ensuring both affordability and quality service to build trust, enhance customer satisfaction, and increase sales conversion. Future research is encouraged to include other influencing variables such as brand trust, promotional strategies, customer reviews, and user experience to provide a more comprehensive understanding of consumer decision-making. It is also recommended that longitudinal or comparative studies be conducted across different product categories or regions to validate and enrich these findings.

Abstract

Malaysia stands on the edge of a major digital transformation in tax administration, with the scheduled implementation of mandatory electronic invoicing (E-invoicing) set to begin in August 2024. Positioned as a cornerstone of the nation's broader digitalization efforts, e-invoicing is expected to reshape business transaction processes by promoting greater transparency, operational efficiency, and improved tax compliance. However, the transition poses significant challenges, particularly for small and medium-sized enterprises (SMEs), which often lack the necessary infrastructure and readiness in implementing e-invoicing. This study examines the various aspects of e-invoicing adoption in Malaysia, highlighting its potential benefits, regulatory challenges, and implementation obstacles. Drawing from extensive literature, the research highlights major concerns such as limited digital capabilities, integration difficulties with existing systems, and rising cybersecurity risks. Despite clear advantages including cost savings, improved data accuracy, and environmental benefits measures the success of this initiative depends heavily on well-structured policies, resilient digital infrastructure, and the integration of technologies like blockchain, artificial intelligence, and cloud computing. The study underscores the importance of targeted support, clear regulatory guidance, and capacity in the building programs to ensure inclusive and effective adoption across all business segments.
Keywords: Digital readiness; E-invoicing; Tax reform.

1. Introduction

Digitalization has significantly enhanced the ability of tax administrations to collect, process, and monitor tax information in real time. Among the most impactful innovations is E-invoicing, which streamlines the exchange of billing data between businesses and tax authorities. Many African tax administrations have embraced digital tools like e-invoicing to boost revenue collection, improve administrative performance, and provide better-quality services to individuals and businesses in promoting a more growth-friendly tax system (African Tax Administration Forum [ATAF], 2021a). E-invoicing also offers operational benefits to businesses by improving the efficiency and accuracy of recordkeeping (PwC, 2021). For tax authorities, it enables timely validation of taxpayer records and cross-verification with trading partners, helping to reduce tax evasion and strengthen compliance (OECD, 2020; IMF, 2020).

Several Asian economies, including South Korea, Indonesia, and India, have implemented phased e-invoicing requirements with differing levels of integration. These initiatives are frequently backed by advanced digital infrastructure and clear regulations. Instead of simplifying business-to-business (B2B) and business-to-government (B2G) transactions, the evolution has given tax authorities the authority to carry out risk-based audits, lessen administrative requirements, and make conducting business easier.

Considering these global trends, Malaysia is ready to start its own e-invoicing journey. The Inland Revenue Board of Malaysia (IRBM) oversees the required implementation, which has been since August 2024. The program is a crucial part of the nation's larger MyDigital strategy, which aims to improve tax efficiency, fortify digital governance, and harmonize with international best practices. In a time when fiscal leakage and shadow economy activities

continue to be major concerns, e-invoicing in Malaysia is intended to foster transparency, operational efficiency, and improved tax compliance.

However, the Malaysian context presents a unique set of challenges. Small and medium-sized firms (SMEs) make up more than 97% of all businesses in the country, yet they frequently lack the resources and technological know-how needed to adhere to e-invoicing laws. Issues, including lack of knowledge, incompatibility with older systems, and cybersecurity vulnerabilities, make the adoption of e-invoicing more challenging. As it moves closer to full implementation, Malaysia will need strong regulatory frameworks, technical infrastructure, public-private cooperation, and supportive mechanisms like financial incentives, capacity-building, and transitional assistance programs (Ernst & Young, 2023; MDEC, 2022).
The objective of this study is to investigate and assess the use of electronic invoicing in the Malaysian business environment, with a particular emphasis on small and medium-sized businesses (SMEs). This study aims to assess the advantages and challenges in adopting E-invoicing, look at how prepared SMEs are for digital and regulatory changes, and suggest tactical ways to get past possible implementation challenges. The goal of this study is to yield insightful information that encourages the widespread use of e-invoicing.

Efforts by the government to improve tax compliance, decrease fraud, and encourage digital transformation in financial reporting have propelled the global adoption of e-invoicing between 2021 and 2025. E-invoicing platforms are now crucial in modernizing tax administration, increasing productivity, and facilitating real-time data verification. E-invoicing systems have been put in place in a number of nations to increase administrative effectiveness, lower fraud, and improve tax compliance. In order to prevent VAT fraud and expedite tax reporting, Italy implemented the Sistema di Inters Cambio (SdI) in 2019, requiring e-invoicing for both B2B and B2G transactions (OECD, 2022). In 2024, France plans to implement a nationwide electronic invoicing system with the goal of lowering administrative costs and enhancing fiscal transparency (European Commission, 2024). Furthermore, to improve GST compliance and enable real-time invoice tracking, India implemented a tiered method in 2020 that required e-invoicing depending on turnover thresholds (EY, 2023). In the effort to strengthen fiscal management and digital trade documentation, Brazil, an early adopter since the 2000s, extended its Nota Fiscal Eletrônica (NF-e) system between 2021 and 2023 (OECD, 2022; PwC, 2021). Besides that, to facilitate real-time B2B transaction monitoring, South Korea is working with the National Tax Service (NTS) to build an e-tax invoicing system between 2021 and 2025 (World Bank, 2021). To increase tax efficiency and facilitate real-time transaction monitoring, Malaysia's 2023 Budget mandated e-invoicing starting in August 2024 (LHDNM, 2023; Budget 2023).

As the need for efficiency, transparency, and digitalization in tax administration grows, Malaysia has implemented a complete E-invoicing Framework, intending to revolutionize the country's tax system. The goals of the Twelfth Malaysia Plan (12MP), which place a strong emphasis on speeding up digital transformation throughout the public sector, are in line with this strategy (Economic Planning Unit, 2021). Malaysia's larger commitment to implementing Fourth Industrial Revolution (IR4.0) technology, enhancing tax compliance, and reducing the shadow economy includes the use of e-invoicing (Ministry of Finance Malaysia, 2023). The Malaysian Inland Revenue Board (IRBM) created the MyInvois system, which makes it easier to validate and submit invoices in real time. The objectives of this system are to improve audit trails, lessen tax fraud potential, and expedite reporting procedures (IRBM, 2023). E-invoicing is essential to Malaysia's digital governance goal, as stated in the national fiscal policies for 2021–2025.

Policy / Source	Period	Initiative / Focus	Main Objectives	Source
Budget 2023 (MOF)	2022 – 2024	Official announcement of mandatory e-invoicing starting August 2024	Tax reform, improve compliance, digitize reporting	Ministry of Finance Malaysia. (2022)
LHDNM e-invoicing Guideline	2023 – 2024	Technical guide on e-invoicing structure and MyInvois system	Standardized e-documents for B2B, B2C, B2G transactions	Inland Revenue Board of Malaysia. (2023)
12th Malaysia Plan (RMK-12)	2021 – 2025	National development strategy; digitalisation of the public sector and tax admin	Modernize tax infrastructure, empower digital SMEs	Economic Planning Unit. (2021a)
Malaysia Digital Economy Blueprint (MyDIGITAL)	2021 – 2025	Digital-first public sector, cloud adoption, real-time services	Enable smart governance and cloud-ready tax systems	Economic Planning Unit. (2021b)
LHDNM e-invoicing Roadmap & FAQs	2024	Detailed phased implementation by taxpayer category	Ensure readiness and clarity for mandatory implementation	Inland Revenue Board of Malaysia. (2024)

Fig. 1. Malaysia's e-invoicing framework

The implementation of e-invoicing in Malaysia, pioneered by LHDN via the MyInvois system, is consistent with the country's larger digital transformation strategy delineated in the Twelfth Malaysia Plan (12MP). Key national policies between 2021 and 2025 that seek to improve compliance, simplify tax administration, and digitize financial reporting are the driving forces behind this project. The formal Budget 2023 requirement for the implementation of e-invoicing beginning in August 2024, the release of comprehensive technical instructions and roadmaps by LHDN, and the strategic frameworks offered by RMK-12 and the Malaysia Digital Economy Blueprint (MyDIGITAL) are some of the crucial initiatives. A complete framework for Malaysia's transition to a digital tax environment is formed by several projects, which collectively place an emphasis on smart governance, digital SME empowerment, real-time services, and standardized e-documentation across B2B, B2C, and B2G transactions.

Malaysia's implementation of e-invoicing is supported by a consistent set of national and regional policy frameworks aimed at speeding digital transformation, boosting tax transparency, and improving administrative efficiency. The 12th Malaysia Plan (2021–2025) provides foundational support by prioritising the modernisation of tax administration through the development of digital infrastructure, sound governance practices, and the empowerment of small and medium enterprises (Economic Planning Unit, 2021). Complementing this, Budgets 2023 and 2024 serve as critical policy instruments that formalise e-invoicing implementation through legislative mandates and fiscal incentives, thereby reinforcing the nation’s broader agenda of tax reform and digitalisation (Ministry of Finance Malaysia, 2023). The Malaysia Digital Economy Blueprint (MyDIGITAL) further positions e-invoicing as a pivotal component in building a secure, trustworthy, and interoperable digital government ecosystem (Economic Planning Unit, 2021b). At the operational level, the LHDNM E-invoicing Guidelines (2023–2024) outline the technical specifications and phased rollout plans necessary to facilitate a structured nationwide implementation (Inland Revenue Board of Malaysia [LHDNM], 2023). Regionally, Malaysia’s strategy aligns with the ASEAN Digital Integration Framework and the OECD’s BEPS 2.0 initiative, both of which advocate for standardised digital tax practices and cross-border interoperability (ASEAN, 2021; OECD, 2022). Collectively, these strategic policy instruments reflect a systematic and future-oriented

approach to digitalising public financial management while promoting compliance, efficiency, and global competitiveness.

NO.	POLICY	RELATION TO E-INVOICING	CHARACTERISTICS																					
			Digital-First Approach – Strong push for digital public services and business transformation.	Governance & Integrity – Enhances transparency and efficiency in revenue collection.	SME Empowerment – Promotes SME digitalisation and automation.	Sustainable Growth – Encourages paperless operations and green technology.	Sustainable Growth – Encourages paperless operations and green technology.	Inclusivity – Ensures fair tax enforcement through digital compliance.	Mandatory Implementation Plan – Phased e-invoice rollout starting August 2024, based on annual turnover.	Tax System Transparency – Seeks to improve auditability and traceability of business transactions.	Combat Shadow Economy – Targets unreported income through real-time validation of e-invoices.	Digital Transformation in Tax – Invests in infrastructure to support e-taxation systems.	Public Sector Digitalisation – Accelerates e-government initiatives like MyInvois.	Cybersecurity & Trust – Emphasizes secure data exchange and protection in digital transactions.	Infrastructure-Driven – Supports cloud, 5G and integration for scalable systems.	Citizen-Centric – Focuses on service delivery efficiency and user experience.	Validation Model – All invoices must be validated via LHDNM before issuance.	Two Submission Options – Via MyInvois Portal (manual) or API integration (automated).	B2B, B2C, B2G Coverage – Applies across all transaction types.	Real-Time Reporting – Enables near-instant tax compliance tracking.	Regional Interoperability – Harmonization of digital transaction systems.	Tax Framework Alignment – Encourages unified e-invoicing structures among ASEAN countries.	International Tax Reform – Linked with OECD's BEPS 2.0 for fair taxation of digital economy.	Future-Proofing Tax Policy – Prepares Malaysia for global e-invoicing & digital VAT requirements.

Fig. 2. Characteristics of government policies in facilitating e-invoicing adoption in Malaysia

Malaysia's adoption of e-invoicing from 2021 to 2025 has benefited the public and private sectors significantly and is consistent with the country's larger vision for digital transformation. Enhancing tax compliance and transparency through real-time invoice validation and reporting to tax authorities is one of the biggest benefits. This improves audit trails and reduces fraudulent activities (Ministry of Finance Malaysia, 2022). The Inland Revenue Board of Malaysia (LHDNM) can reduce the tax gap and encourage more accountability in the fiscal ecosystem with the help of this capability.

E-invoicing promotes process automation and cost reduction from an operational standpoint. Business transactions are streamlined by the digitization of invoicing procedures, which decreases human error, administrative overheads, and manual entry (Inland Revenue Board of Malaysia, 2023). Businesses have reported up to 80% cost savings by doing away with paper-based invoicing procedures, including printing, storage, and postal costs, according to recent industry data (Billentis, 2020; Avalara, 2025).

Adopting standardized formats for business-to-business (B2B), business-to-consumer (B2C), and business-to-government (B2G) transactions also makes it easier for different platforms and sectors to integrate seamlessly and promotes industry-wide interoperability (Inland Revenue Board of Malaysia, 2024). Faster payment cycles, better working capital management, and increased cash flow efficiency are all benefits of interoperability, especially for SMEs (Economic Planning Unit, 2021a).

By enabling a cloud-ready, digital-first public sector, e-invoicing also plays a critical role in furthering the objectives of the Malaysia Digital Economy Blueprint (MyDIGITAL), which includes better administrative transparency and public service delivery (Economic Planning Unit, 2021b). The move to paperless operations greatly lowers carbon emissions and advances worldwide Environmental, Social, and Governance (ESG) goals from the perspective of environmental sustainability (Carbon Trust, 2022; Pagero, 2025).

Additional operational advantages include improved invoicing accuracy, where automation has resulted in a 37% decrease in invoice disputes, strengthening vendor relationships, and requiring less reconciliation work (Aberdeen Group, 2021). Additionally, by offering real-time financial information, integration with business systems enhances forecasting, data analysis,

and strategic decision-making (Digitalist Magazine, 2023). According to Kolleno (2025) and the OECD (2021), e-invoicing facilitates digital audit capabilities and real-time tax inspections, ensuring regulatory compliance with both local and international standards, including those suggested by the OECD. As more nations enact laws requiring digital reporting, this compliance readiness is very important. Finally, e-invoicing systems' scalability makes them ideal for small and medium-sized businesses (SMEs), allowing for expansion without corresponding increases in administrative burden (Gartner, 2024). Additionally, automated audit trails and secure digital records strengthen data integrity, lower the risk of fraud, and increase responsibility (HSBC Business Go, 2023; Kiizen, 2024). When combined, these advantages demonstrate how e-invoicing may revolutionize Malaysia's financial environment and increase its competitiveness in the global digital economy.

Beginning in August 2024 for companies with yearly revenues over RM100 million, Malaysia has implemented a phased mandate for mandatory electronic invoicing, or e-invoicing, through the MyInvois system. By January 2026, smaller businesses will follow suit (IRBM, 2023b). This phased implementation is in line with Malaysia's overarching objectives for digital transformation, which include improving economic formalization, operational transparency, and tax compliance (EPU, 2021). The shift is fraught with difficulties, though, especially for small and medium-sized businesses (SMEs), which must overcome organizational, financial, legal, and technical obstacles. According to analysts, complete support will be necessary to enable inclusive and successful adoption, even in the face of continued mitigation tactics such as exemptions, training initiatives, and financial incentives (KPMG, 2023; Tricor, 2024).

Since the Inland Revenue Board (IRBM) uses a structured e-invoicing format based on XML or JSON standards, Malaysian SMEs frequently use antiquated accounting systems that are incompatible with it (IRBM, 2023a). Real-time data validation, system upgrades, and large API investments are necessary for integration with the MyInvois system. For businesses that have not yet digitized, the IRBM's need for 55 invoice fields, of which 37 are mandatory, presents a hurdle (Deloitte, 2023). Frequent data formatting problems, duplicate errors, and rejected invoices because of unfilled fields have been reported by early adopters. Cybersecurity concerns are also quite real, and stakeholders stress the importance of strong encryption and data control (PwC Malaysia, 2024), as lack of the ability to properly handle system updates or secure sensitive financial data, SMEs with inadequate IT infrastructure are excessively impacted.

Adoption becomes even more challenging due to the changing compliance framework. Implementation dates and requirements have changed after the publication of IRBM's E-Invoice Guideline Version 4.1 (and later 4.2), particularly for SMEs. Businesses having RM25 million to RM100 million in sales as of 2024 are needed to comply by January 2025, while those with RM500,000 or less only have to comply by January 2026 (IRBM, 2023b). New regulations pertaining to self-billed and aggregated invoices, which vary between B2B and B2C transactions, must also be understood by taxpayers. Concern over the "fear of non-compliance due to complexity and ambiguity," particularly during the transitioning phase, has been voiced by numerous SMEs (SME Corp Malaysia, 2023). Lacks in knowledge and comprehension still exist across industries, despite the government's provision of short-term respite through "soft launch" grace periods and allowances for monthly consolidated billing (Bernama, 2024).

One additional significant obstacle is the cost of compliance. Financial hardship results from the need for many SMEs to retrain employees, pay consultants or software suppliers, and purchase new digital tools (World Bank, 2022). Larger companies might be able to afford these expenses, but small and medium-sized businesses find it difficult to put digital investments ahead of fundamental functions. The Malaysian government implemented accelerated capital allowances for ICT-related purchases under Budget 2024 in order to lessen this burden (MOF, 2023). Concurrently, the Malaysia Digital Economy Corporation (MDEC) collaborated with

software providers to provide SMEs with free or inexpensive e-invoicing services. However, there are still remaining concerns over the long-term sustainability and dependability of these technologies, which contribute to their uneven adoption (Tricor, 2024). Even if incentives reduce the cost of entry, many companies say that unanticipated costs like vendor lock-in, system outages, or training delays still prevent full implementation.

Problems with people and organizations exacerbate technical and financial difficulties. There are misconceptions regarding the e-invoicing procedure because a sizable percentage of Malaysian SMEs lack internal IT and finance skills (KPMG, 2023). Many businesses make the mistake of confusing structured e-invoices with PDF invoices, which causes mistakes and delays. Due to the large variations in digital literacy among employees and small business owners, resistance to change is also common. According to a recent KPMG poll, 78% of SMEs said they were "less than halfway ready" for the changeover (KPMG, 2023). The challenges of scale for larger firms include realigning procedures, retraining entire accounting teams, and modernizing enterprise resource planning (ERP) systems. In addition to technology improvements, these human elements point to a greater need for extensive, focused training programs.

The IRBM and Ministry of Finance have implemented a number of support mechanisms, such as extended deadlines, training roadshows, and subsidized instruments, to solve these issues. More than 1,000 officers from all around Malaysia have been mobilized by the "Jelajah Mega e-Invois 2025" program to interact with SMEs directly and spread awareness (Bernama, 2024). Beyond that, the MyInvois software and webpage were created to assist microbusinesses in sending out free electronic invoices. Despite these attempts, analysts stress that a patient and well-coordinated strategy is one that gives companies the time and room to adjust without facing excessive penalties, which is essential to Malaysia's success. Despite the implementation phase is still complicated and developing, Malaysia is well-positioned to establish a more transparent, effective, and technologically enabled tax system with sustained support.

2. Methodology

Government records, official websites (such IRBM and SME Corp Malaysia), and academic databases, including ScienceDirect, Emerald Insight, and Google Scholar, are the sources of secondary data used in this study. Understanding the idea of e-invoicing, recognizing the difficulties SMEs confront, and analyzing its effects on SMEs, tax authorities, and other stakeholders are the goals. To find important topics about the advantages, challenges, and implications of implementing e-invoicing, content analysis was employed. Thematic analysis aided in highlighting research gaps, comparing results from various studies, and coming to logical conclusions. This method offers information on how SMEs adjust to electronic invoicing and offers tactics to facilitate a more seamless transition for all parties.

3. Results and Discussion

Malaysia's e-invoicing initiative is an essential step in improving transparency, supporting tax administration, and encouraging company adoption of digital technologies in accordance with the Twelfth Malaysia Plan and MyDIGITAL Blueprint. LHDNM's MyInvois technology facilitates real-time invoice validation and integration with existing systems to reduce fraud and improve tax compliance (Inland Revenue Board of Malaysia [IRBM], 2023a). Despite the clear benefits, such as reduced administrative costs, improved auditability, and environmental sustainability, many expectations remain unfulfilled, especially among SMEs. Technical challenges that hinder adoption include cybersecurity flaws, data integration issues, and obsolete accounting software (PwC Malaysia, 2024; KPMG, 2023). Moreover, regulatory ambiguity, which includes continuously updated rules and varying compliance levels based on turnover, makes the transition more challenging and time-consuming for SMEs (IRBM, 2023b; SME Corp Malaysia,

2023). Despite government support, including training roadshows and subsidized tools, SMEs continue to face resource limitations and digital literacy issues.

Adoption is further complicated by organizational and financial constraints. Many SMEs still find it difficult to pay for staff training, consultancy, and system improvements, despite the Budget 2024's introduction of expedited capital allowances and software incentives (Ministry of Finance Malaysia, 2023). Additionally, due to their lack of digital literacy and resistance to change, SME owners and employees often confuse organized e-invoicing for simple PDF forms (KPMG, 2023). Surveys indicate that approximately 78% of SMEs are not fully prepared for the August 2024 requirement, highlighting the critical need for targeted capacity-building programs (KPMG, 2023).

Category	Benefits	Challenges
Tax Compliance	Real-time validation improves audit trails & reduces fraud (IRBM, 2023a)	Regulatory ambiguity and frequently updated guidelines confuse SMEs (IRBM, 2023b; SME Corp Malaysia, 2023)
Operational Efficiency	Automates invoicing process, reduces manual errors and admin workload (Billentis, 2020; Kolleno, 2025)	Integration issues with legacy systems, API investment burdens (PwC Malaysia, 2024; Deloitte, 2023)
Financial Impact	Reduces costs (up to 80%) by eliminating paper-based invoices (Avalara, 2025)	High initial costs for software upgrades, training, and consultation (MOF, 2023; World Bank, 2022)
Environmental Sustainability	Supports ESG goals by reducing paper usage and emissions (Carbon Trust, 2022)	Lack of awareness of the sustainability link among SMEs
Cash Flow & Payment	Faster invoice cycles lead to better cash flow and working capital management (Economic Planning Unit, 2021a)	Payment cycle benefits are not visible to businesses without full integration.
Digital Transformation	Enhances adoption of cloud systems, blockchain, ERP integration (Digitalist Magazine, 2023)	Low digital literacy, resistance to change among SME owners & staff (KPMG, 2023)
Scalability	Ideal for SMEs scaling up operations with limited admin overhead (Gartner, 2024)	SMEs lack IT teams; misconceptions (e.g., confusing PDF with structured XML invoice)
Cybersecurity	Enables secure storage, traceability, and reduces invoice tampering (HSBC, 2023; Kiizen, 2024)	Rising cybersecurity concerns and lack of internal IT safeguards (PwC Malaysia, 2024)
Regulatory Alignment	Helps align Malaysia with global standards (OECD, 2022; EY, 2023)	Overlap between business models (B2B/B2C/B2G) leads to confusion in invoice categorisation
Government Support	Grants, MyInvois portal, Jelajah Mega roadshows & capital allowance support (Bernama, 2024; MOF, 2023)	Concerns over long-term sustainability and reliability of free software tools (Tricor, 2024)

Fig. 3. E-invoicing implementation in Malaysia: Adoption benefits vs challenges

4. Conclusion

In the country's journey towards digital tax reform, Malaysia's audacious decision to make e-invoicing mandatory is a turning point. The initiative's success depends on its capacity to bridge the digital readiness gap, especially among SMEs, even though it offers more transparency, operational efficiency, and worldwide regulatory harmonization. Fragmented adoption, unclear regulations, and insufficient digital capacity continue to be major obstacles despite robust policy support, obvious benefits, and established technological infrastructure.

Malaysia must provide inclusive, scalable solutions, boost public-private cooperation, and step up capacity-building initiatives to fully adapt to this digital revolution. E-invoicing can only become a revolutionary tool that changes Malaysia's fiscal landscape and equips its business ecosystem for a digital-first future by implementing coherent policies, rather than merely being a compliance mandate.

APPLICATION OF SALES BUDGET IN ESTIMATING SALES AT DUDUKIN COFFEESHOP

Viona Saskia Putri, Nurhayati*

Management Study Program, Sekolah Tinggi Ilmu Manajemen Sukma, 20219 Medan, North Sumatra, Indonesia

*Corresponding author e-mail address: nurhayati@stimsukmamedan.ac.id

Abstract

This study aims to develop a sales budget at Dudukin Coffeeshop using the Trend Moment, Least Square, and Semi Average forecasting methods. Effective sales planning is very important to maximize revenue and manage product availability, especially for their flagship product, Sanger. The data used in this research is Sanger sales data from January to December 2024. This research uses a quantitative descriptive approach with analysis techniques in the form of sales forecasting using the three methods, as well as calculating the Standard Forecasting Error (SKF) to assess the accuracy of each method. The results of the Standard Forecasting Error (SKF) analysis show that the Semi Average method has an SKF value of 86.14, followed by the Trend Moment method with an SKF value of 95.21 and the Least Square method with an SKF value of 98.99. From the calculation of the Standard Forecasting Error (SKF), the most appropriate method to use is the Semi Average method because it has the lowest Standard Forecasting Error (SKF) value. Thus, the Semi Average method is considered the most accurate and is used to prepare a sales budget for the January-March 2025 period, with estimated revenue of Rp31,140,000 and total sales of 2,076 cups. This budget is expected to assist management in making strategic decisions related to menu development, promotion, pricing, and resource allocation.
Keywords: Budget; Forecast; Sales.

1. Introduction

In 2024, the Indonesian economy faces a series of complex challenges caused by global pressure, is increasing inflation, and as well a slowdown Power buy society. Medan City, which is one of the centers growth economy and culture in North Sumatra, also felt the impact from crisis this, especially in the micro, small and medium enterprises (MSMEs). One of the most affected sectors is industry culinary, especially the business coffee shops (coffeeshop). The coffee shop business is a small and medium-sized enterprise group that is currently growing rapidly and attracting the attention of the government and business owners in Indonesia. According to the Ministry of Industry of the Republic of Indonesia, as stated on kemenperin.go.id, several considerations have been taken into account to establish regulations and implement development programs, aiming to make small and medium industries efficient and effective in the future. One of these considerations is the role of coffee shops (Adiningrum et al., 2022). The previous coffee shop become favourite place for young and professional circles for gather, work, and socialize, now face decline drastic in amount visitors and daily transactions. Situation This the more exacerbated by the increase price material standard, such as coffee beans, milk, and sugar, which cause operational costs to swell. One way to maintain the survival of a business is by effectively managing the management functions across all aspects of business activities so that good and maximum results can be obtained in accordance with the business plan.

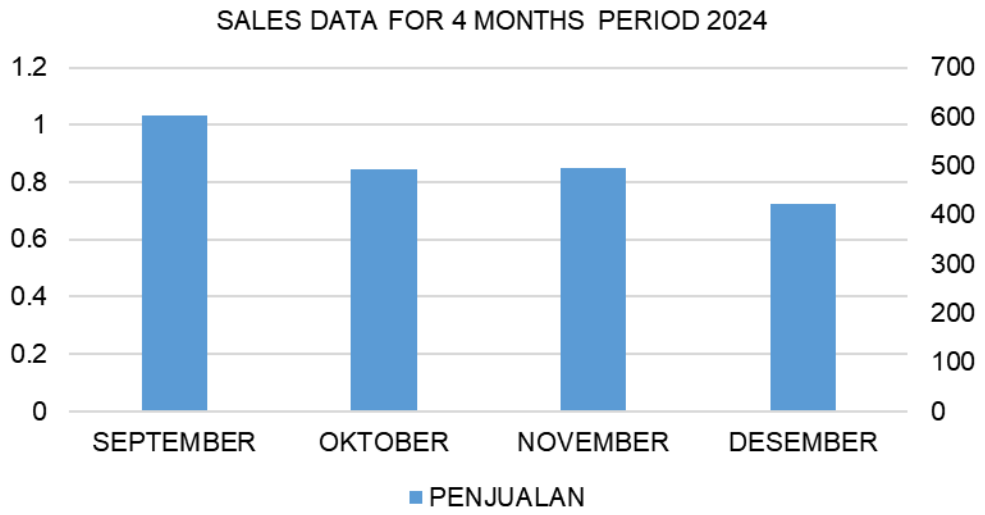

Fig. 1 Sales data at Dudukin Coffeeshop in 2024

On the other hand, society now chooses to prioritize expenditure on needs, so that power buyers of non-essential products, such as specialty coffee, are experiencing a significant decline. Impact from the crisis is very noticeable, visible from the adjustment budget sales made by the perpetrator's business coffee shop in Medan. Many perpetrators' efforts that must be made revise sales targets annually, reduce budget promotion, and do massive efficiency to persist. Declining turnover sales, which were originally not predictable, forcing management to compile repeat projection revenue and design more strategies adaptive to the unfavourable market situation stability.

In running an activity business, every company needs to do thorough planning to reach the goals that have been set. One of the form plans is compilation budget sales. The company was established with the primary goal of maximizing profits so that the company's survival can grow sustainably. In order to achieve optimal profits, the company needs to increase the volume of sales. On that basis, a sales budget is used as a planning and control tool for the company's activities. In preparing the sales budget, the company must determine the volume and selling price of the products to be sold in the specified time period, thus sales forecasting is essential in the preparation of the sales budget (Dwijayanti & Lasmini, 2024). One form of planning is the preparation of a sales budget. Without a budget, managing a company's operations can become difficult, especially in terms of sales planning. Sales are the main source of the company's revenue, and the success or failure of a business often depends on how sales management can improve sales performance (Risty et al., 2024).

The budget is a planning of the company's operational activities that are interconnected and plays an important role as a work guideline tool so that every company activity can be directed towards achieving the desired goals (Septianti & Dahtiah, 2021). Document This own role is important in project income companies as well as become base in compile budget other like budget production, budget costs, and cash budget. Sales Budget is an estimate of the company's sales over a certain period based on various factors, including market trends, economic conditions, competition, and marketing strategies. Preparing a more accurate sales budget helps businesses allocate resources optimally, avoid waste, and improve efficiency and profitability (Akbar et al., 2024). Sales forecasting is the expected level of company sales based on a chosen marketing plan and an assumed marketing environment (Kotler & Keller, 1959). This means that sales forecasts are not only based on past data but also take into account marketing strategies and the current market situation.

Coffee Shop Sit down is a business operating in the field of food and beverages, especially serving coffee with draft shop contemporary hangout. One of its mainstays is Sanger drink,

which is quite in demand by customers. However, in Operational, Coffeeshop Sit down Not yet apply system budget sales based on data and systematic calculations. This can impact on less optimal planning income and control cost operations. Without existence budget proper sales, coffeeshop This will difficulty in plan purchase material standard, set timetable staff, and manage cash flow. budget designed sales with Good No only functioning as tool control, but also as a guide strategy for Coffee Shop Sit down.

For compile budget accurate sales, required method forecasting proper sales. Forecasting methods are generally used to determine the sales budget, but it is also possible that these methods can be used to determine the production budget, as the production budget is very important within a company to ensure that the finished goods inventory is adequate (Darwis & Yusiana, 2016). In research this, writers use three method forecasting, namely method Trend Moment, Least Square, and Semi Average. The Trend Moment Method is a time series model prediction method that seeks a trend line based on certain mathematical and statistical calculations to find a straight-line function that replaces the broken line formed from the company's historical data, which is then projected to predict future outcomes (Fitriani & Rakhma Devi, 2022). While the Least Square Method is A methods that can used in matter predict a price with using data from the past for made into guidelines in the future come. This method have superiority that is one of them can do prediction against data that is fluctuating or ebb and flow (fluctuating) (Ghulam et al., 2022). And the Semi Average Method is a half average trend method that determines that for known function Y = a + bx, all historical data shared into two groups with the amount of each member is the same. Third method This chosen Because capable describe trend sale based on historical data as well as easily implemented by the perpetrator business micro small medium (MSMEs).

Forecasting methods are broadly divided into two: qualitative forecasting methods and quantitative forecasting methods. The quantitative method focuses on numerical calculations based on past statistical data. This quantitative method has several estimation techniques, namely the free hand method, semi average method, moment method, least square method, and parabolic method (Hazmi et al., 2023). While the qualitative method focuses on opinions or experiences of informants based on interim sales data (Syamsul et al., 2022). By using these forecasting methods, it is hoped that Coffeeshop Dudukin can develop a more measurable and accurate sales budget, thereby supporting better decision-making in the future.

2. Methodology

Study This use types of secondary data in the form of notes on report sales at Coffeeshop Sit down and research This use approach quantitative descriptive purposeful to describe How implementation budget sale done at Coffeeshop Sit down as well as How budget the used for estimate sales. The quantitative research approach can be defined as a research method based on positivism philosophy, which can be used to study a certain population or sample, collect data using research instruments, analyze quantitative/statistical data, with the aim of testing the stated hypothesis (Prayogi & Kurniawan, 2024). Approach quantitative chosen Because study This involves numerical data and analysis statistics simple in evaluating accuracy planning sales. Research This using quantitative data in the form of sales data Sanger products in the period January 2024 to December 2024. Data sources used in study This namely internal data obtained from notes sales at Coffeeshop Sit down.

This study uses technique analysis in the form of forecasting sales with the method forecasting Trend Moment, Least Square, and Semi Average, as well as count Standard Error Forecasting (SKP) to evaluate the accuracy of each method. Data analysis was performed in a number of stage as following:

i. Sales Data Processing: Sales data arranged in tables and graphs for easily understood trends as well as fluctuations that occur every month.
ii. Forecasting Sales: Sales data 2024 used for count projection sale January 2025 with use three Methods: Trend Moment, Least Square, Semi Average.
iii. Compilation Budget Sales: Results from forecasting will be made into base in compile budget sale For January 2025.
iv. Comparison of Results: Results from third method forecasting compared to see which method gives more stable and realistic results.

3. Results and Discussion

This research uses data collection techniques in the form of observation. The Observation Method is a data collection technique conducted through observation, accompanied by notes on the conditions or behaviors of the target objects (Hasibuan et al., 2023). In this research, observation is conducted by directly examining the sales records owned by Dudukin Coffeeshop, as well as documentation in the form of recording historical data on Sanger product sales for the year 2024. Following is sales data Sanger products from January to December 2024:

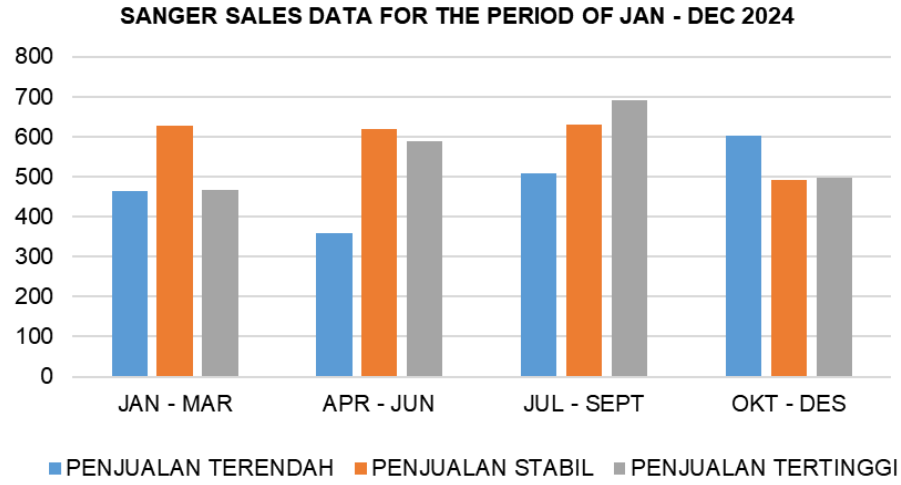

Fig. 2 Sanger product sales data

Trend Moment, also known as the Secular Trend, is a time-series forecasting method that adjusts a trend line using a set of past data and then projects it forward to forecast the future, for short- or long-term forecasting (Amrullah et al., 2020). In another sense, the Trend Moment method is a simple and effective way to calculate sales forecasts, making it time-efficient to implement in a company (Fakhta Tri Nasution & Ridho Lubis, 2022). Steps for calculating the Trend Moment method:

i. Determine the value of Y is from results sale with period the time that has passed determined
ii. Determine the value of the X parameter is from 0 and sorted in accordance with Y value
iii. Determine the value of XY is with multiply X value and Y value
iv. Determine the value of X2 is with squaring X value

Determine Forecasting Sale using the Trend Moment Method:

$$Y = a + b\,X \quad (1)$$

$$\sum Y = na + b\sum X \quad (2)$$

$$\sum XY = a\sum X + b\sum X2 \quad (3)$$

Then input its value into the equality formula above so that the result:

$$6{,}546 = 12\ a + 66\ b \quad (4)$$
$$36{,}846 = 66\ a + 506\ b \quad (5)$$

Next, to find the a/b value using the elimination method, first multiply equation 1 by 11 and equation 2 by 2 so that the value of a in the second equation matches the b value, which is 5.90, and is equal to 513.05. Furthermore, the values of a and b are applied to the Trend Moment method for sales from January 2024 to December 2024 (refers to Table 1).

$$Y = a + b\ X \quad (6)$$
$$Y = 513.05 + 5.90\ (X) \quad (7)$$

Table 1. X, Y, XY, XY2 values and estimates the trend moment method

No	Month	X	Y	XY	X2	TM
1	January – 24	0	464	0	0	574.4
2	February – 24	1	628	628	1	568.51
3	March – 24	2	466	932	4	562.62
4	April – 24	3	360	1080	9	556.73
5	May – 24	4	620	2480	16	550.84
6	June – 24	5	588	2940	25	544.95
7	July – 24	6	509	3054	36	539.06
8	August – 24	7	630	4410	49	533.17
9	September - 24	8	691	5528	64	527.28
10	October – 24	9	602	5418	81	521.39
11	November - 24	10	492	4920	100	515.5
12	December - 24	11	496	5456	121	509.61

The Least Squares method is a technique for predicting a price using past data to guide future predictions (Ghulam et al., 2022). The least-squares method determines the best-fitting linear regression line by minimizing squared errors. Least Squares Method Calculation steps:

i. Determine the value of Y from the results of sales within a specific period based on the elapsed time.
ii. Determine the value of X for the period data, since the period is 12 months (even number), the X values start from -11, -9, -7, -5, -3, -1, 1, 3, 5, 7, 9, 11.
iii. Calculate the value of XY by multiplying the X value by the Y value.
iv. Calculate the value of X^2 by squaring the X value.

After the values of a and b are known, the result is substituted into equation (6), so the equality method least square method becomes Y = 545.5 + 2.95 (X).

Table 2. X, Y, XY, XY2 values and estimates least square method

NO	MONTH	X	Y	XY	X2	LS
1	January – 24	-11	464	-5104	121	513.05
2	February - 24	-9	628	-5652	81	518.95
3	March – 24	-7	466	-3262	49	524.85
4	April – 24	-5	360	-1800	25	530.75
5	May – 24	-3	620	-1860	9	536.65
6	June – 24	-1	588	-588	1	542.55
7	July – 24	1	509	509	1	548.45
8	August – 24	3	630	1890	9	554.35
9	September-24	5	691	3455	25	560.25
10	October – 24	7	602	4214	49	566.15
11	November - 24	9	492	4428	81	572.05
12	December - 24	11	496	5456	121	577.95

The Semi-Average Method involves dividing data into two parts, then calculating the average of each part to serve as a base trend line. Semi-Average Method Calculation Steps:

1. Divide the data into two groups, each containing an even number of data points.
2. Determine the base period
3. Assign a period number x = 0 to the base period.
4. Calculate the semi-total, which is the total sales for each group.
5. Find the semi-average for each group by dividing the semi-total appropriately.

Table 3. Three mark calculation in estimation semi average method

No	Month	Sale	Group	X	Semi Total	Semi Average	Year Trends
1	January - 24	464		-5			
2	February - 24	628		-3			
3	March – 24	466	I	-1	3.126	521.00	521 + 8.16 (X)
4	April – 24	360		1			
5	May – 24	620		3			
6	June – 24	588		5			
7	July – 24	509		7			
8	August - 24	630		9			
9	September – 24	691		11			
10	October - 24	602	II	13	3.420	570.00	570 +8.16 (X)
11	November – 24	492		15			
12	December - 24	496		17			

Based on previous calculations using the trend method, least squares, and semi-average, the company can select the most appropriate method for compiling the sales forecast budget. To determine which method is best to apply in the company, these methods—trend, least squares, and semi-average—are then evaluated using the Standard Error of Forecasting (SKF). SKF is one of the key criteria for comparing sales forecast results. The smallest SKF value indicates that the forecast closely approximates the actual situation. Formula standard error forecasting:

$$(SKF) = \sqrt{\Sigma} (X-Y)\ 2/n \quad (8)$$

Where Y represents actual sales (realization), X is the sales forecast, and n is the number of periods analyzed. The calculation of SKF = 95.21 sales at Dudukin Coffeeshop using the trend moment method is as follows:

Table 4. SKF sales table use method trend moment

No	Month	Sales (Y)	Sales Forecast (X)	X - Y	(X - Y) 2
1	January – 24	628	574.4	-53.60	2,872.96
2	February – 24	466	568.51	102.51	10,508.30
3	March – 24	360	562.62	202.62	41,054.86
4	April – 24	620	556.73	-63.27	4,003.09
5	May – 24	588	550.84	-37.16	1,380.87
6	June – 24	509	544.95	35.95	1,292.40
7	July – 24	630	539.06	-90.94	8,270.08
8	August – 24	691	533.17	-157.83	24,910.31
9	September – 24	602	527.28	-74.72	5,583.08
10	October – 24	492	521.39	29.39	863.77
11	November – 24	496	515.5	19.50	380.25
12	December - 24	422	509.61	87.61	7,675.51
		6,504			108,795.49

Calculation of SKF sales at Dudukin Coffee Shop using the least squares method as follows:

Table 5. SKF sales using the least square method

No	Month	Sale (Y)	Sales Forecast (X)	X - Y	(X-Y) 2
1	January – 24	628	513.05	-114.95	13,213.50
2	February - 24	466	518.95	52.95	2,803.70
3	March - 24	360	524.85	164.85	27,175.52
4	April - 24	620	530.75	-89.25	7,965.56
5	May - 24	588	536.65	-51.35	2,636.82
6	June - 24	509	542.55	33.55	1,125.60
7	July - 24	630	548.45	-81.55	6,650.40
8	August - 24	691	554.35	-136.65	18,673.22
9	September -24	602	560.25	-41.75	1,743.06
10	October - 24	492	566.15	74.15	5,498.22
11	November - 24	496	572.05	76.05	5,783.60
12	December - 24	422	577.95	155.95	24,320.40
		6,504			117,589.63

$$SKF = \sqrt{\Sigma (X-Y)2\ n} = \sqrt{117,589,\ 63:12} = 98.99$$

Calculation of SKF sales at Dudukin Coffeeshop using the semi-average method as follows:

Table 6. SKF sales use semi average method

No	Month	Sale (Y)	Sales Forecast (X)	X - Y	(X - Y) 2
1	January - 24	628	480.15	-147.85	7,924.76
2	February - 24	466	496.49	30.49	3,125.53
3	March - 24	360	512.83	152.83	30,966.41
4	April - 24	620	529.17	-90.83	5,746.81
5	May - 24	588	545.51	-42.49	1,578.93
6	June - 24	509	561.85	52.85	1,899.96
7	July - 24	630	627.19	-2.81	255.54
8	August - 24	691	643.53	-47.47	7,492.19
9	September - 24	602	659.87	57.87	- 4,324.05
10	October - 24	492	676.21	184.21	5,413.93
11	November - 24	496	692.55	196.55	3,832.73
12	December - 24	422	708.89	286.89	25,134.43
		6,504			89,047.18

$$SKF = \sqrt{\Sigma (X-Y)2\ n} = \sqrt{89.047,18:12} = 86.14$$

As for the results from SKF using third method is presented in form table as following:

Table. 7 SKF comparison of trend moment, least square and semi average methods

No	Method	SKF
1	Trend Moment	95.21
2	Least Square	98.99
3	Semi Average	86.14

From the comparison of the sizes of the SKF values shown in the table above, we can see that among the methods used, the trend method has an SKF of 95.21, the least squares method has an SKF of 98.99, and the semi-average method has an SKF of 86.14. Therefore, one can conclude that the semi-average method is preferable because it has a higher SKF value compared to the trend method and the semi-average method. After calculating forecasted sales and the forecast standard error (SKF), Coffeeshop Dudukin can use the semi-average method as its sales budget for the upcoming year. Based on the semi-average

method, the budgeted sales for Sanger products from January to March 2025 can be estimated, with the highest expected demand leading to an anticipated income of Rp. 31,140,000 and total sales of 2,076 cups.

4. Conclusion

Based on the results of the study on the implementation of sales budgeting at Coffeeshop Sit Down using forecasting methods such as Trend Moment, Least Square, and Semi Average, it can be concluded that Coffeeshop Sit Down has not yet developed a system to compile sales budgets based on historical data and trend analysis. Therefore, sales planning remains simple and unstructured. Based on forecasting results from Sanger's 2024 sales data, the following results were obtained:

i. 1. Trend Moment Method estimates sales from January to March 2025 at 1,491 cups.
ii. 2. Least Square Method estimates sales from January to March 2025 at 1,767 cups.
iii. 3. Semi Average Method estimates sales from January to March 2025 at 2,076 cups.

Among these methods, the Semi Average Method provides the highest and most descriptive sales forecast, showing a strong mathematical approach to identifying sales trends. Therefore, this method is most appropriate for compiling the sales budget for Sanger products from January to March 2025. The estimated sales budget for this period is 2,076 cups, which corresponds to a revenue of Rp. 31,140,000 (assuming a selling price of Rp. 15,000 per cup).

Abstract

This study analyses the influence of online media and marketplaces on product sales at CV Alkena Store. Online media includes digital platforms such as Facebook and Instagram, while marketplaces include Shopee, Bukalapak, and Tokopedia. The research question in this article is: Do online media and marketplaces have a positive and significant impact on product sales at CV Alkena Store? The purpose of this article is to determine the extent to which online media and market trends influence product sales growth at CV Alkena Store. This study aims to analyze the influence of online media and marketplaces on product sales at CV Alkena Store. By utilizing advances in digital technology and increased internet access, CV Alkena Store carries out marketing strategies through online media and marketplace platforms to increase sales. This study found that online media and marketplaces can increase product visibility, expand customer reach, and increase customer trust through review and rating systems. In addition, this study also found that the use of online media and marketplaces can help companies increase product sales more effectively and efficiently. However, some challenges need to be overcome, such as tight competition on marketplace platforms and high online marketing costs. Therefore, this study can provide insight for companies on how to utilize online media and marketplaces to increase product sales and overcome existing challenges. Thus, this study can help companies improve their marketing and product sales performance in the digital era. This study can also contribute to the development of digital marketing theory and online marketing strategies, as well as provide recommendations for other companies that want to increase product sales through online media and marketplaces. In addition, this study can also help raise awareness of the importance of utilizing digital technology. The quantitative method with the Slovin formula is used to determine the sample with a significance value of 10%. The number of respondents/samples is 98 customers from a population of 4,000. The results show a significant correlation between online media and marketplaces with sales, with a contribution of 71.7%.
Keywords: Social Media; Marketplace; Sales.

1. Introduction

The development of digital technology has changed the way companies market their products. CV Alkena Store, as a company engaged in the retail sector, carries out marketing strategies through online media and marketplaces to increase sales. Online media and marketplace platforms have become two major forces in modern marketing strategies. The growth of increasingly digitally connected consumers and the ability to make purchases online has made digital marketing one of the key elements in today's company marketing strategies. According to Anugrah (2023) online media or social media is a digital marketing tool that can reach all groups and is easily accessible. Online media refers to digital platforms that allow users to access and interact with content online via the internet. With online media, users can access news, entertainment, education, and other information quickly and easily.

According to Lestari & Patrikha (2022) Market place can be said to be a collection of many shops that sell. Marketplace offers various features that support the buying and selling process, such as product catalogues, secure payment systems, product reviews and ratings, and logistics services. According to Hidayah (2023) Marketplace is a platform that provides a place and means for sellers to gather. Then offer products or goods, which can be services, to be sold to potential consumers or customers. According to Sopali (2022), marketplace is a site whose main service is social networking services, including Shopee, Bukalapak, Tokopedia, and others. According to Lestari & Patrikha (2022) Marketplace can be said to be a collection of many shops that sell. Marketplace offers various features that support the buying and selling process, such as product catalogs, secure payment systems, product reviews and ratings, and logistics services.

According to Sumayati & Yatimatun (2021), the definition of sales is the purchase of something (goods or services) from one party to another party by getting money in return from that party. Sales are a source of company income; the greater the sales, the greater the income the company receives. According to Ana et al. (2021), sales is a science that can provide its own influence for sellers, to invite potential consumers to be interested in buying products. It can be concluded that sales is the process of giving something to other people/buyers with the aim of obtaining money as compensation or payment. The phenomenon of online media in this study was when Alkena Store started operating as an online store and utilizing social media platforms such as Facebook and Instagram. In 2020, the use of online media in Indonesia increased rapidly. As a result of the report Datareport (2020), 160 million people in Indonesia, or 59% of the total population, use social media, and 175.4 million people use the internet which is equivalent to 64% of the total population in 2020. So, the owner took advantage of the opportunity to sell on online media.

The marketplace phenomenon in this study was when the owner of CV Alkena Store saw the great development in the use of marketplaces in Indonesia, and realized this great potential and then decided to expand their marketing strategy by selling their goods on various marketplace platforms. As a result of the report from Databoks (2020), Shopee led as the largest site visitor, reaching 96.5 million. By using online media and marketplaces, he can increase the visibility of his products and take advantage of the promotional features provided by the marketplace platform, thereby expanding customer reach and increasing customer trust through the review and rating system in the marketplace.

Marketplace is an online platform that connects sellers and buyers to conduct transactions for buying and selling products or services. Marketplace platforms, such as Shopee, provide access to millions of potential consumers worldwide. Companies can leverage existing marketplace infrastructure to market their products without having to build their own sales platform. Features such as advanced product search, customer reviews, and product recommendations allow companies to increase product visibility and influence consumer purchasing decisions. Although online media marketing and marketplace presence offer many opportunities for CV Alkena Store, some challenges need to be overcome. These challenges include intense competition on marketplace platforms, potentially high online marketing costs, and difficulties in building brand awareness and consumer trust online. This phenomenon is an important background for further research on how online media and marketplaces can influence product sales at CV Alkena Store.

2. Methodology

2.1 Basic Research Framework

According to Sugiyono & Hadi (2021), the research method is basically a scientific way to obtain data with certain goals and uses. Based on this, there are four keywords that need to be considered, namely the scientific method, data, goals, and uses. The scientific method

means that research activities are based on rational, empirical, and systematic scientific characteristics. Based on this explanation, it can be concluded that the research method is a scientific method used to obtain data in accordance with research studies with certain goals and uses.

2.2 Research Identification

According to Abubakar (2021), these variables consist of two types, namely independent variables and dependent variables:

i. Independent variables, these variables are often called stimulus variables, predictors, or antecedents. Often also referred to as free variables. Independent variables are variables that cause changes or the emergence of dependent variables (bound).
ii. The independent variables (free) in this study are online media (X1) and marketplace (X2).
iii. Dependent Variable, this variable is often called the output variable, the criteria, and the constant. It is also often referred to as the bound variable. The bound variable is a variable that is influenced or that is the result, because of the existence of the independent variable.

The Dependent Variable (bound) in this study is Product Sales (Y).

2.3 Operational Definition of Research Variables

The operational definition of research variables can be seen in the following table.:

Tabel 1. Operational Definition and Indicators of Research Variables

Variable	Definition	Indicator	Measurement Scale
Online Media (X1)	Online media or social media is a digital marketing tool that can reach all groups and is easily accessible.	1. Interesting and Entertaining Content 2. Consumer and Seller Interaction 3. Consumer Interaction 4. with Consumers Ease of Searching Product Information 5. Ease of Communication of Information to the Public 6. Level of Trust in Online Media	Likert
Marketplace (X2)	Marketplace is a platform that provides a place and means for sellers to gather. Then offer products or goods, which can be services, to be sold to potential consumers or customers.	1. Facilitate transactions 2. Bring together sellers and buyers 3. Provide infrastructure	Likert

Variable	Definition	Indicator	Measurement Scale
Product Sales (Y)	Sales is one of the functions in marketing, where the goal is for the company to make a profit so that the company's operational activities continue to run.	1.Achieving sales volume 2. Gaining profit 3.Supporting company growth	Likert

2.4 Population

According to Abubakar (2021) population is all data sources or research subjects or sources from which data will be obtained. The population in this study is all customers of CV Alkena Store who have purchased products through online media and marketplaces in the last 3 months.

2.5 Sample

According to Abubakar (2021) explains that a sample is part of the research population or a representative of the population being studied. Then, research using a population or sample, also greatly depends on the ability of the researcher himself, for example from the ability of the researcher's manpower, funds, and time. The population to be taken is active customers with CV Alkena Store in the last 3 months, the number of customers is 4,000. Determining the number of samples (respondents) the author uses the formula from Slovin, namely as follows:

$$n = \frac{N}{1+Ne^2} \quad (1)$$

Where :
N = Sample
N = total population
E = Estimated error rate with a significance level (10%) based on this formula, the following sample numbers are obtained:

$$n = \frac{4000}{1 + 4000(0.1)^2}$$

$$n = 97.5 \; rounded \; up \; to \; 98$$

In this study, the percentage of sampling error rate of 10% as the error limit in sampling, so based on the formula, the number of calculations from the population of 4,000 customers, the sample in this study amounted to 97.5 respondents which was rounded up to 98 respondents. According to (Hikmawati., 2020) explains that research data sources consist of:

a. Primary Data Sources

Primary data sources require data or information from the first source, usually we call it respondents. The primary data taken by researchers is from questionnaires to obtain their perceptions and experiences using online media and marketplaces and their impact on product sales.

b. Secondary Data Sources

Secondary data sources use materials that are not from the first source as a means of obtaining data or information to answer the problems being studied. In addition to primary data, the data sources used by researchers are secondary data sources, secondary data is obtained through various sources, namely books, the internet, and other research journals related to the topic being researched by the author.

The data collection technique in this study is by using a questionnaire. According to (Hikmawati., 2020:83) a questionnaire is a data collection technique carried out by giving a set of questions or written to respondents to be answered. The type of data source in this study is primary data. Analysis of research measuring instruments is a method used by a researcher to determine the extent to which a variable affects another variable. The purpose of the data analysis method is to interpret and draw conclusions from several collected data. Data processing uses a computer program, namely SPSS version 25.00. SPSS is a computer program that functions to help process statistical data correctly and quickly.

3. Results and Discussion

In the analysis of research data, researchers will present data obtained from online shop customer responses. In this study, a pre-test was conducted on a random customer respondent who had shopped in online media and marketplaces as many as 30 people. After that, the questionnaire was distributed to CV Alkena Store customers, with a total of 98 respondents, to obtain the original results. In the questionnaire, there are 24 statements, of which 12 are about online media, 6 are about marketplaces, and 6 are about product sales. There are 5 choices in the questionnaire, namely strongly agree, agree, less agree, disagree and strongly disagree.

Table 2. Online Media Validity Test Results (X1)

Statement To -	r	Test Results
1	0,757	Valid
2	0,913	Valid
3	0,787	Valid
4	0,756	Valid
5	0,754	Valid
6	0,639	Valid
7	0,889	Valid
8	0,73	Valid
9	0,808	Valid
10	0,827	Valid
11	0,838	Valid
12	0,685	Valid

Based on the table above, the online media variable is declared valid.

Table 3. Marketplace Validity Test Results (X2)

Statement To -	r	Test Results
1	0,606	Valid
2	0,863	Valid
3	0,856	Valid
4	0,856	Valid
5	0,78	Valid
6	0,859	Valid

According to the table above, it is evident that the marketplace variable value is declared valid.

Table 4. Sales Validity Test Results (Y)

Statement To -	r	Test Results
1	0,864	Valid
2	0,892	Valid
3	0,835	Valid
4	0,828	Valid
5	0,840	Valid
6	0,859	Valid

Based on the table above, the Sales variable is declared valid.

Table 5. Online Media Reliability Test Results (X1)

Cronbach's Alpha	N of Items
0.943	12

Based on the table above, it can be seen that the value of the online media variable is indicated as reliable.

Table 6. Marketplace Reliability Test Results (X2)

Cronbach's Alpha	N of Items
0.892	6

Based on the table above, it is evident that the marketplace variable value is considered reliable.

Table 7. Sales Reliability Test Results (Y)

Cronbach's Alpha	N of Items
0.924	6

Based on the table above, it is evident that the sales variable is considered reliable.

According to Ibrahim et al., (2018) the data normality test is to determine whether the data population is normally distributed or not. If the data is normally distributed, then a parametric statistical test can be used. Meanwhile, if the data are not normally distributed, a nonparametric statistical test is used. According to Ibrahim et al., (2018)"The linearity test is a test that will ensure whether the data we have is in accordance with the linear line or not. The linearity test is used to confirm whether the linear nature between two variables identified in theory is in accordance with the existing research results or not. According to Hidayah (2021) the classical assumption test is a test carried out to determine whether there are classical assumption problems in the Ordinary Leas Square (OLS) linear regression model. According to Hidayah (2021), to obtain an efficient and unbiased examination value, also known as BLUE (Best Linear Unbiased Estimator) from a multiple linear regression equation, the classical assumption test consists of: normality test, multicollinearity test, and heteroscedasticity test.

According to Sukardi as cited in Gunawan (2023), correlation refers to a study involving the collection of data to ascertain whether a relationship exists, as well as the strength of that relationship, between two or more variables. It is important to note that correlation does not establish causation; rather, it merely indicates the presence or absence of a relationship between the examined variables. Additionally, Indriastuti (2019) states that the coefficient of determination is significant as it represents the proportion of influence that the independent variable exerts on the dependent variable. In other words, the value of the coefficient of determination, or R-squared, is useful for predicting and quantifying the contribution of variable X to variable Y, expressed as a percentage.

Indriastuti (2019) states that this regression analysis aims to assess how strongly variables affect the dependent variable (Y). To examine the impact of each independent variable, specifically online media (X1) and marketplace (X2), on product sales (Y), a simple linear regression is applied. According to Yahya (2023), a hypothesis is a statement or assumption proposed by researchers as a temporary answer to research questions. A hypothesis helps test the truth of a proposed theory, generate new ideas for developing existing theories, and broaden understanding of the phenomena being studied. Additionally, the hypothesis is used to examine the influence of independent variables on dependent variables.

Table 8. Partial Test Results (T-Test)

Model		Unstandardized Coefficients		Standardized Coefficients	t	Sig.
		B	Std. Error	Beta		
1	(Constant)	9.081	.415		21.864	.001
	Media online	.305	.009	.946	35.476	.001
	Marketplace	.031	.015	.054	2.029	.045

$$Y = 9.081 + 0.305 (X1) + 0.031(X2)$$

The online media variable is 35,476 with a significance level of 0.001 because the calculated t value (35,476) is greater than the t table (1.66) and the resulting sig value of 0.001 is less than 0.05. Therefore, the HO is rejected, and the HI is accepted. Online media has a partial and significant effect on sales. The marketplace variable is 2,029 with a significance level of 0.045 because the calculated t value (2,029) is greater than the t table (1.66), and the resulting sig value of 0.045 is less than 0.05. Therefore, the HO is rejected, and the HI is accepted. The marketplace has a significant impact on sales.

Table 9. Simultaneous Test Results (F-Test)

Model		Sum of Squares	df	Mean Square	F	Sig.
1	Regression	172.694	2	86.347	883.704	.001[b]
	Residual	9.283	95	.098		
	Total	181.977	97			

From the test results, the calculated F value was 883.704 with a significance of 0.001. Therefore, the significance value is less than 0.05 (0.001 < 0.05), so the hypothesis that "Online Media and Marketplace jointly influence product sales at CV Alkena Store" is accepted.

Based on the regression coefficient, the t statistic for the online media variable is 35,476, while the t table value is 1.66, so 35,476 > 1.66. Additionally, with a significance value of 0.001 (which is less than 0.05) and the t table value, H1 is accepted and H0 is rejected. Rejecting H0 indicates that online media has a positive and significant effect on product sales at CV Alkena Store. This suggests that CV Alkena Store's online media plays an important role in efforts to boost employee productivity. Similarly, the t statistic for the marketplace variable is 2.029, compared to the t table value of 1.66, so 2.029 > 1.66. With a significance value of 0.045 (less than 0.05) and the t table value, H1 is accepted and H0 is rejected. Rejecting H0 shows that the marketplace has a positive and significant impact on product sales at CV Alkena Store. This indicates that the marketplace is crucial in efforts to increase product sales. From the test results, the calculated F value is 883,704, with a significance level of 0.001. Since this value is smaller than 0.05 (0.001 <0.05), it can be concluded that online media and marketplaces jointly influence product sales at CV Alkena Store.

4. Conclusion

Based on the study results, the researcher concludes that: Partially, online media has a significant effect on product sales at CV Alkena Store. Partially, the marketplace also significantly impacts product sales at CV Alkena Store. Additionally, both online media and the marketplace together have a significant effect on product sales at CV Alkena Store. According to the determination coefficient test, the R square value was 71.7%, while the remaining 28.3% was influenced by other factors not included in the model. There is a significant positive correlation between online media and sales, with an r value of 0.536 indicating a strong and positive relationship. Likewise, the marketplace shows a significant positive correlation with sales, with an r value of 0.288 indicating a weak but significant relationship.

Abstract

In a competitive business world, price and product quality are two important factors that influence purchasing decisions. This research was conducted to determine the influence of price and product quality on consumer purchase decisions at Cafe Mie and You. This study uses a quantitative approach with a survey method, where data is obtained through the distribution of questionnaires to Cafe Mie and its consumers, totalling 79 respondents. The analysis technique used is multiple linear regression to test the influence of independent variables (price and product quality) on dependent variables (purchase decisions). The results of this study show that both price and product quality have a positive and significant effect on consumer purchase decisions, both partially and simultaneously. These findings suggest that competitive pricing strategies and improved product quality can be important factors in driving purchasing decisions.
Keywords: Price; Product quality; Purchase decision.

2. Introduction

The level of competition in Indonesia is very tight, as the company is always trying to increase market share and reach new customers. Marketing is a comprehensive, integrated and planned activity, carried out by an organization or institution in an effort to be able to accommodate market demand by creating products with selling value, determining prices, communicating, delivering, and exchanging valuable offers for consumers, clients, partners, and the general public (Indrasari, 2019).

Price is one of the elements of a marketing mix strategy. Because price is considered to be one of the determining factors for the company's sustainability, a price strategy is not the only way to overcome various problems in running a company (Haque, 2020). Price is often associated with product quality; price itself is an element of the marketing mix that earns revenue or also the easiest element in the scope of marketing to be adjusted, channels and even product features (Cahyono et al., 2020), The price has a positive effect on the purchase decision on the Shopee marketplace in Mojokerto has been proven. Shows on Shopee marketplace prices with quality according to consumer needs, and provide many discounts and promotions (Ilmiyah & Krishernawan, 2020).

Price is the amount of money (plus some products if possible) required to obtain a certain number of combinations and products and services (Gunarsih et al., 2021). Product quality refers to the extent to which a product can meet or exceed consumer expectations. Product quality includes characteristics such as durability, aesthetic appearance, ease of use, reliability, and the suitability of the product with the promised specifications.(Eka Murti Hartono & Sumantri Indra Wicaksana, 2023), Product quality is a totality that includes the characteristics and properties of the product or service that affect the level of consumer trust

in the product or service and how long that trust can last (Chaerunnisa et al., 2023). Product Quality is the quality that includes efforts to meet or exceed customer expectations that include products, services, people, processes, and the environment (Scott, 2021).

Decision-making as a form of consumer behaviour is a form of psychological process that occurs in a human being. This means that even though it is not visible, decisions can be inferred from observable behaviours that decisions have been made, so that it can be concluded that a psychological "decision-making" event has occurred. The consumer's mind has been described as a black box, which shows the interaction of stimuli, consumer characteristics, decision-making processes, and consumer responses (Tri Nuryani et al., 2022). A quality product can definitely meet and satisfy the needs of a person who uses the product. Purchasing decisions are a process in which consumers get to know the problem, seek information about a particular product or brand, and evaluate how well each of these alternatives can solve the problem, which then leads to a purchase decision (Hafidh Fauzi, 2021), Purchase discretion is the behaviour that consumers engage in seeking, evaluating, and spending on a product or service that is expected to satisfy their needs (Wicaksono et al., 2023).

Table 1. Caffe Mie and You sales data in 2023

Month	Sum
March	157.850.430
April	211.693.003
May	197.674.734
June	109.386.857
July	80.534.680
August	94.650.786
September	100.912.635
December	97.642.400

Based on the sales data in Table 1 above, the sales of Caffe Mie and You are erratic or stable, sometimes increasing and sometimes decreasing from month to month. Sales from March to May remain steady, but sales from June to December experience a sharp decline. Caffe Mie and You need to consider this to understand consumer or public preferences when visiting. Therefore, the author explores whether the pricing of products at Caffe Mie and You aligns with their quality and whether the quality, especially taste, influences customers' interest in purchasing.

3. Methodology

This research method is quantitative. Quantitative methods rely on objective measurements and statistical analysis of sample data collected through various instruments such as questionnaires, servers, tests, or other research tools to verify or test the hypotheses proposed in the study. Quantitative research is a research method based on the philosophy of positivism, used to research a specific population or sample, collect data using research instruments, and analyze quantitative or statistical data, with the aim of testing the hypothesis that has been formulated (Melpiana & Sudarajat, 2022). The data collection technique used is a questionnaire, by providing a set of questions and written statements to respondents to provide responses according to the information needed (Novi Rudiyanti et al., 2025). A sample is a part of the population that is the source of data in the study, where the population is part of the number of characteristics possessed by the population. If the population is large and it is not possible to study everything in the population, for example, due to limited funds, energy, and time, then the study can use samples taken from the population (Asia et al., 2023).

Then, to obtain high-quality research data, classical assumption testing is also carried out, consisting of a normality test, a Mult consistency test, and a heteroscedasticity test. To answer the research questions, this study also uses hypothesis testing, specifically a T-test. This T

test will show how much influence independent variables have on dependent variables. The Partial Test (t-test) aims to determine the influence of each independent variable on the bound variable. The decision-making criterion in this test according to (Ghozali, 2016) is that if the p value < 0.05, then Ha is accepted. Conversely, if the p value is ≥ 0.05 then Ha is rejected (Selvia et al., 2022).

4. Results and Discussion

Table 2. Age Characteristics of Respondents

Customer's Age	Sum	Presentation
16-19	33	41,7%
20-24	38	48,1%
25-30	8	10,2%
Total	79	100%

From Table 2 above, respondents who bought were 16-19 years old, accounting for 33 of the total respondents. Respondents who bought were aged 20-24 years old, as 38 people out of the total respondents. Respondents who bought were aged 25-30 years old as 8 people out of the total respondents. Thus, the dominant age groups among respondents who made purchases were 20-24 and 16-17 years old.

Table 3. Kolmogorov-Smirnov Test Sample Test Results

Normal Parameters, b	Mean	,0000000
	Std. Deviation	3,18521046
Most Extreme Differences	Absolute	,082
	Positive	,082
	Negative	-,082
Test Statistic		,082
Asymp. Sig. (2-tailed)		,200c, d

In Table 3 above, it can be seen that the results of the Kolmogorov-Smirnov normality tester prove that the value of the significant level produced is greater than 0.05, which is 0.200, so it can be concluded that the statistical tester of normality is classified as a normal distribution.

Table 4. Linearity Test Results

			Sum of Squares	Df	Mean Square	F	Sig.
Purchase Decision * Price	Between Groups	(Combined)	1322,397	16	82,650	7,477	,000
		Linearity	1133,642	1	1133,642	102,558	,000
		Deviation from Linearity	188,755	15	12,584	1,138	,343
		Within Groups	685,324	62	11,054		
		Total	2007,722	78			

Based on Table 4 above, the linearity coefficient is 0.343 > 0.05, indicating that Price has a linear relationship with the Purchase Decision.

Table 5. Correlation test results

		Price	Product Quality	Purchase Decision
Price	Pearson Correlation	1	,689**	,751**
	Sig. (2-tailed)		,000	,000
	N	79	79	79
Product Quality	Pearson Correlation	,689**	1	,665**

	Sig. (2-tailed)	,000		,000
	N	79	79	79
	Pearson Correlation	,751**	,665**	1
Purchase Decision	Sig. (2-tailed)	,000	,000	
	N	79	79	79

Based on Table 5 above, the significant value (2-Tailed) is 0.000, which is less than 0.05, indicating a relationship. Therefore, it can be concluded that Price has a moderate relationship with the Purchase Decision. Similarly, the significance value (2-Tailed) for Product Quality is 0.000, which is also less than 0.05, indicating a relationship. Hence, it can be concluded that Product Quality has a moderate relationship with the purchase decision.

Table 5 Determination Coefficient Test Results

Type	R	R Square	Adjusted R Square	Std. Error of the Estimate
1	,778a	,606	,595	3,227

Based on the table above, it can be concluded that the variables Price and Product Quality account for 60.6% of the Purchase Decision variable.

Table 6. Multiple Linear Regression Test Results

Type		Unstandardized Coefficients		Standardized Coefficients	t	Sig.
		B	Std. Error	Beta		
1	(Constant)	2,540	2,623		,968	,336
	Price	,535	,095	,558	5,621	,000
	Product Quality	,330	,117	,280	2,819	,006

In the table above, it is known that in the unstandardized coefficients of part B, a multiple linear regression equation is obtained, namely with the following formula:
Purchase Decision = 2.540 + 0.535 Price + 0.330 Product Quality. Based on the above equation, it can be described as follows:

a. Constant = 2.540 indicates the value of the constant. If the value of the free variable X1, i.e., Price, and the value of X2, Product Quality, are both 0, then customer loyalty will increase by 2.540.
b. The coefficient X1b1 = 0.535 shows that the Price variable (X1) has a positive effect on the Purchase Decision of 0.535. This means that for every 1-unit increase in Price (X1), the Price to the Purchase Decision will increase by 0.535.
c. The coefficient X2b2 = 0.330 indicates that the Product Quality (X2) variable has a positive impact on the Purchase Decision, with an effect size of 0.330. This means that for every 1-unit increase in Product Quality (X2), the likelihood of the Purchase Decision increases by 0.330.

Based on Table 6, the t-value for the price variable is 5.621 with a significance level of 0.000. Since the p-value is below 0.05, the null hypothesis is rejected. The results of the t-test confirm that price has a statistically significant effect on product quality. This supports the research hypothesis and aligns with the existing literature on price as a purchasing decision.

Based on the normality test, the results of the research conducted by the researcher indicate that the Kolmogorov-Smirnov values for Price and product quality are 0.200, indicating that the data are normally distributed (p-value> 0.05). Based on the linearity test, Price shows a linear relationship (p-value = 0.343 > 0.05), and Product Quality shows a linear relationship (p-value = 0.040 < 0.05). Based on the correlation test carried out, the correlation value between Price is 0.000 and product quality is 0.000, which means that Price and product quality have a moderate correlation relationship in the purchase decision. The results of the determination coefficient test indicated that the R Square value was 0.606, indicating that the

variables Price (X1) and Product Quality (X2) accounted for 60.6% of the variance in Purchase Decision (Y).

Based on the results of the multiple linear regression test carried out, it showed that the value of the constant was 2.540, which showed a positive influence on the independent variables (X1 and X2). Meanwhile, the value of the regression coefficient of the price of the variable X1 is 0.535, which means that if the variable X1 increases by 1 unit, then Y will increase by 0.535 or as much as 53.5%. The value of the coefficient of the Product Quality regression of the variable X2 is as large. 0.330 This means that if the variable X2 increases by 1 unit, then Y will increase by 0.330 or 33%.

4. Conclusion

Based on the research results, the study concluded that Price (X1) and Product Quality (X2) influence the purchase decision (Y) at Caffe Mie and You Lubuk Pakam. Both price and product quality significantly affect consumer purchasing decisions at these cafes. The t-test results confirmed that each variable, individually and collectively, has a positive and significant impact on purchase decisions. Therefore, it can be concluded that a strong pricing strategy and high product quality are essential for influencing consumer choices at the cafe.

Abstract

This study aims to examine the influence of product quality and service quality on customer loyalty at Oddete Resto, Medan. The method used is quantitative. The number of respondents is 97 customers of Oddete Resto, Medan. The basis for the selection of this sample is the non-probability sampling method using accidental sampling techniques. The magnitude of the influence of product quality and service quality on customer loyalty can be seen from the results of the determination test percentage between product quality (X1) and service quality (X2) to customer loyalty (Y) is 94%. This proves that product quality and service quality influence customer loyalty by 94% and the rest is influenced by other factors that are not examined.
Keywords: Product quality; Service quality; Customer loyalty.

1. Introduction

Intense business competition, characterized by many companies producing similar products, can lead to a decrease in sales volume. To survive and succeed, companies must engage in marketing that builds a strong company image. Customer loyalty is essential for business continuity, and it is significantly influenced by product quality and service quality. Good products and services can increase customer satisfaction and loyalty, while failures in these areas can lead to a decrease in loyalty. Customer loyalty is defined as a deep-seated commitment to consistently repurchase or re-subscribe to a product or service in the future, despite situational influences or marketing efforts from competitors that might cause behavioural changes. Product quality is considered one of the main factors in a company's competitiveness and is defined by the physical condition, function, and nature of a product that aims to meet and satisfy consumer needs. Service quality, on the other hand, is the company's ability to meet customer expectations, and it is perceived as good when the service received aligns with what was expected.

Customer loyalty is a deep-seated customer commitment to re-subscribe or repurchase selected products or services consistently in the future, even though situational influences and marketing efforts have the potential to cause behavioural changes (Gultom et al., 2020). The research conducted by Christopher dan Lauren (Sasongko, 2021) loyalty is the availability of customers to continue to subscribe to a company in the long term, by buying and using its goods and services repeatedly, and voluntarily recommending the company's products to others. Product quality is one of the main things that is considered in the company. Quality is one of the important policies in increasing the competitiveness of the main product to provide satisfaction to consumers that exceeds or is at least equal to the quality of competitors' products (Santoso, 2019). The research conducted by (Othman et al., 2022), Product quality is the physical condition, function, and nature of a product, either goods or services, based on

the expected level of quality, such as durability, reliability, accuracy, ease of operation, product repair and other product attributes with the aim of meeting and satisfying consumer or customer needs.

Service quality is the company's expertise to meet customer expectations, and also if the service received or that has been experienced is as expected, so that the quality is perceived as good and can satisfy customers (Cesariana et al., 2022). Oddete Resto Cafe Vegan Vegetarian, inaugurated on May 1, 2019, is known for its healthy vegan-vegetarian menu and cozy atmosphere. However, interviews with customers revealed issues such as prices not matching the quality of the food and drinks, excessive use of MSG, long waiting times, and menu-recording errors. This dissatisfaction could lead loyal customers to seek alternatives. Therefore, this study aims to investigate the influence of product quality and service quality on customer loyalty at Oddete Resto.

The vegan-vegetarian cafe serves food and drinks without animal products, using ingredients such as vegetables, fruit, grains, and legumes. Since its inauguration, Oddete Resto Cafe Vegan Vegetarian has succeeded in providing a good experience through the dishes and atmosphere offered.Based on the issues circulating about the phenomenon that occurred, the author conducted interviews with several customers at Oddete Resto, Medan. From the results of interviews conducted by the author at Oddete Resto Cafe Vegan Vegetarian, Medan that the price given is not in accordance with the expectations of the food or drink received, for example, the taste quality of food and drinks is normal, but too much MSG is given. And the service provided to customers is also not appropriate, for example, a very long waiting time, and an error in recording the customer's menu. This phenomenon can make customers feel dissatisfied and cause loyal customers to look for other substitutes.Based on the background above, the author is interested in finding out "Is there an influence of product quality, service quality on customer loyalty at Oddete Resto, Medan?".

2. Methodology

According to Waruwu (2023), research methods are procedures and schemes used in research. Researchers conducted research using quantitative research methods. According to Priadana, M.S. & Sunarsi S.Pd., M.M., CHt (2021), the quantitative research type is a systematic investigation of a phenomenon by collecting data that can be measured using statistics, mathematics, or computing. This research was conducted at Oddete Resto Cafe Vegan Vegetarian, located at Jl. Bakaran Batu No.19 AA, Sei Rengas Permata, Kec. Medan Area, Medan City. The research period started in March 2024 and ended in June 2024.

According to Sugiyono (Ulfa, 2021), states that basically a research variable is something in the form of anything that is determined by the researcher to study so that information about it is obtained, then conclusions are drawn. In this study, there are three variables used, namely two independent variables and one closed variable. Researchers use two independent variables (free), namely Product Quality (X1) and Service Quality (X2), and the dependent variable (bound) is Customer Loyalty (Y).

According to (Suriani et al., 2023), population is the entire object or subject of research that has certain characteristics to be studied and conclusions drawn. In this study, the population used by researchers is all customers who have made purchases at Oddete Resto Cafe Vegan Vegetarian, Medan. Because the population is too large to be taken entirely in the study, the researchers used the Accidental Sampling technique, which is a form of sampling based on chance. Where, anyone who happens to meet the researcher and is considered suitable as a data source, will become a research sample. In calculating the number of samples using nonprobability sampling techniques with an accidental sampling approach, researchers used the Lameshow formula as follows:

$$n = \frac{(1.96)^2 x 0.5 x 0.5}{(0.1)^2} = 96.04 \quad (1)$$

Table 1. Definition operational

No.	Variabel	Definisi	Indikator	Skala Pengukuran
1.	Product Quality (X1)	"Quality is an overall evaluation process to consumers for the improvement of the performance of a product" Mowen (Arianto & Difa, 2020).	1. Performance 2. Features 3. Reliability 4. Conformance 5. Durability 6. Serviceability 7. Aesthetics 8. Perceived quality	Likert
2.	Service Quality (X2)	"Service quality is a form of assessment of the level of service provided by the bank to customers in accordance with their expectations." Harahap & Amanah (Meilani & Sugiarti, 2022).	1. Tangible 2. Reliability 3. Responsiveness 4. Assurance 5. Empathy	Likert
3.	Customer Loyalty (Y)	"Customer loyalty is a customer's commitment to a brand, store or supplier based on a very positive attitude and is reflected in consistent main purchases." Tjiptono (Putra, 2021)	1. Repeat Purchases 2. Habitual Consumption of the Brand 3. Great Love for the Brand 4. Fixation on the Brand 5. Belief that a Certain Brand is the Best 6. Recommendation of the Brand to Others.	Likert

In accordance with the results of the calculation, the results of the minimum sample size required in the study was 96.04 respondents, and the authors increased it to 97 respondents. The data collection methods in this study are:
a) Interview: Data collection techniques carried out through face-to-face and direct questioning and answers between researchers and sources.
b) Observation: Observation data collection methods not only measure the attitudes of respondents but can also be used to record various phenomena that occur. Observation data-collection techniques are suitable for research aimed at studying human behavior, work processes, and natural phenomena.
c) Questionnaire/questionnaire: Data collection methods are carried out by giving a set of questions or written statements to respondents to answer.

In this study using a Likert scale as a measuring tool in a survey. The Likert scale is a technique commonly used in questionnaires to measure respondents' attitudes, opinions, or perceptions of something.

Table 2. Likert scale score

Positive Statement	Score	Negative Statement	Score
Strongly Agree (SA)	5	Strongly Agree (SA)	5
Agree (A)	4	Agree (A)	4
Neutral (N)	3	Neutral (N)	3
Disagree (D)	2	Disagree (D)	2
Strongly Disagree (SD)	1	Strongly Disagree (SD)	1

3. Results and Discussion

Based on the results of the research conducted on 97 respondents through the distribution of questionnaires to Oddete Resto, Medan customers. The total number of respondents used was 97, categorized by gender as shown in the following table:

Table 3. Description of respondent characteristics by gender

Gender	Total (Person)	Percentage
Male	48	49.5%
Female	49	50.5%
Total	97	100%

Based on the table, it is evident that out of the 97 respondents, they can be divided into two categories based on gender. There are 48 males, which accounts for 49.5% of the total, and 49 females, representing 50.5%. This indicates that most of the research participants are female**.** According to (Prasetyo et al., 2019) validity testing is carried out by correlating the scores of each question item using product moment correlation techniques. To find out whether a question item is considered valid, the value of the validity coefficient will be seen compared to the cut off value. The interpretation of the validity coefficient is considered valid if the validity coefficient is> 0.30 so that the items are considered valid, otherwise if the validity coefficient is less than 0.30 (<0.30) then the items are invalid. According to (Duli, 2019, p. 106), reliability is a test tool to determine the extent to which the measurement results remain consistent when measuring two or more times against the same symptoms using the same measuring instrument. The level of reliability of a research construct/variable can be seen from the Cronbach Alpha (α) statistical results. A variable is said to be reliable if it provides a Cronbach alpha value> 0.60. The more the alpha value approaches 1, the more reliable the data reliability value is.

From the calculations using SPSS 26, as seen in the Pearson correlation column between the product quality, service quality and customer loyalty variables, it is considered valid if the corrected item is more than 0.3. Based on the results of the reliability testing conducted in this study, each indicator that has passed the validity test will be processed using Cronbach Alpha. A statement will be considered reliable if the Cronbach Alpha value is > 0.6. Questionnaires were distributed for a pre-test to 30 respondents outside the sample, namely Oddete Resto, Medan. The analysis was carried out to determine the validity of each question using SPSS 26, where the validity and reliability results for product quality, service quality and customer loyalty can be observed in the details below. Based on the Table 4, it is known that there are 16 statement items in the product quality (X1) and service quality variable (X2) that are considered valid because the corrected item values are > 0.3, it is known that there are 15 statement items in the customer loyalty variable (Y) that are considered valid because the corrected items values are > 0.30.

Table 4. Result of Validity and Reliability Test Product Quality, Service Quality and Customer Loyalty

No.	Corr. Items	Cronb. Alpha	No.	Corr. Items	Cronb. Alpha	No.	Corr. Items	Cronb. Alpha
X1	0.363	0.821	X1	0.875	0.886	Y1	0.582	0.831
X2	0.383		X2	0.513		Y2	0.555	
X3	0.573		X3	0.415		Y3	0.432	
X4	0.433		X4	0.424		Y4	0.603	
X5	0.613		X5	0.727		Y5	0.488	
X6	0.710		X6	0.609		Y6	0.600	
X7	0.391		X7	0.809		Y7	0.538	
X8	0.554		X8	0.782		Y8	0.401	

X9	0.375	X9	0.718	Y9	0.557
X10	0.396	X10	0.394	Y10	0.475
X11	0.702	X11	0.380	Y11	0.692
X12	0.498	X12	0.654	Y12	0.736
X13	0.763	X13	0.520	Y13	0.771
X14	0.725	X14	0.697	Y14	0.366
X15	0.391	X15	0.691	Y15	0.363
X16	0.602	X16	0.640		

It can be concluded that the questionnaire statement items in the product quality variable are considered reliable because 0.821>0.60; it can be concluded that the questionnaire statement items in the service quality variable are considered reliable because 0.886>0.60; and it can be concluded that the questionnaire statement items in the customer loyalty variable are considered reliable because 0.831>0.60. According to Widarjono (Duli, 2019), the normality test aims to determine whether the residual values are normally distributed or not. This test can be conducted using a histogram test, normal P-Plot test, Chi-Square test, Skewness and Kurtosis, or Kolmogorov-Smirnov test. Before we proceed with the actual analysis, the research data must undergo a test for the normality of its distribution. Good data is characterized by a normal distribution. The basis for decision-making in the normality test is as follows: if the significance value is greater than α = 0.05, then the data is considered normally distributed. Conversely, if the significance value is less than α = 0.05, then the data is not normally distributed.

Table 5. Result of Normality Test

One-Sample Kolmogorov-Smirnov Test		
N		97
Normal Parameters[a,b]	Mean	.0000000
	Std. Deviation	.97243826
Most Extreme Differences	Absolute	.067
	Positive	.067
	Negative	-.054
Test Statistic		.067
Asymp. Sig. (2-tailed)		.200[c,d]

Based on the results of the normality test, it is observed that the significance value is 0.200>0.05. Therefore, it can be concluded that the residual values follow a normal distribution. According to (Kambono & Marpaung, 2020), the multicollinearity test aims to test the correlation between independent variables in regression. A good regression model should be free from such correlation. Multicollinearity can be seen from the Variance Inflation Factor (VIF) and Tolerance values, where VIF < 10.00 and Tolerance > 0.10 indicate the absence of multicollinearity.

Table 6. Result of Multicollinearity Test

Model		Collinearity Statistics	
		Tolerance	VIF
1	Product Quality	.208	4.801
	Service Quality	.208	4.801

The table above shows that the tolerance and VIF values for product quality and service quality meet the tolerance criteria (0.208> 0.10) and VIF criteria (4.801 < 10.00), so the regression model is free from multicollinearity and suitable for use. According to Widarjono (Duli, 2019,

p. 122), the heteroscedasticity test assesses whether the residual variances differ across observations. The decision-making basis for the Heteroscedasticity test is: If the significance >α=0.05, no heteroscedasticity occurs; if <α=0.05, heteroscedasticity occurs. A good regression model should be free from heteroscedasticity.

Table 7. Result of Heteroscedasticity Test

Model		Unstandardized Coefficients		Standardized Coefficients	t	Sig.
		B	Std. Error	Beta		
1	(Constant)	1.590	.695		2.286	.024
	Product Quality	-.009	.028	-.070	-.311	.756
	Service Quality	-.008	.030	-.059	-.262	.794

The table above shows the significance value of product quality 0.756>0.05 and service quality 0.794 > 0.05, so the regression model is free from heteroscedasticity and is suitable for use.

3.1 Result of Correlation Coefficient Test

According to (Qomusuddin & Siti, 2021), correlation analysis is the analysis of the relationship between two or more variables, specifically between independent variables and dependent variables.

Table 8. Result of Correlation Coefficient Test

		Product Quality	Service Quality	Customer Loyalty
Product Quality	Pearson Correlation	1	.890**	.932**
	Sig. (2-tailed)		.000	.000
	N	97	97	97
Service Quality	Pearson Correlation	.890**	1	.942**
	Sig. (2-tailed)	.000		.000
	N	97	97	97
Customer Loyalty	Pearson Correlation	.932**	.942**	1
	Sig. (2-tailed)	.000	.000	
	N	97	97	97

The results show a Pearson correlation between product quality (X1) and customer loyalty (Y) of 0.932, and between service quality (X2) and customer loyalty (Y) of 0.942. The two asterisks signify a strong relationship, and the positive correlation value indicates that improving product and service quality increases customer loyalty. The coefficient of determination is data to determine how much the percentage of the direct influence of the independent variable is getting closer to the dependent variable or it can be said that the use of the model is justified, according to Sugiyono (Julhendri Sinaga et al., 2020).

Table 9. Result of Coefficient Determination Test

Model	R	R Square	Adjusted R Square	Std. Error of the Estimate
1	.970[a]	.940	.939	.983

a. Predictors: (Constant), Service Quality, Product Quality
b. Dependent Variable: Customer Loyalty

Based on the table above, it shows the R Square value of 0.940, meaning that product quality (X1) and service quality (X2) affect customer loyalty (Y) by 94% at Oddete Resto, Medan. According to (Qomusuddin & Siti, 2021, p. 82), multiple linear regression analyses the effect of two or more independent variables (X) on the dependent variable (Y). The multiple linear regression model is described by the following equation:

$$Y = a + \beta 1.X1 + \beta 2\,.X2 \quad (2)$$

Table 10. Result of Multiple Linear Regression Test

Model		Unstandardized Coefficients		Standardized Coefficients	t	Sig.
		B	Std. Error	Beta		
1	(Constant)	9.935	1.113		8.930	.000
	Product Quality	.377	.045	.464	8.390	.000
	Service Quality	.457	.047	.533	9.628	.000

The regression test results show that Constant (α) = 9,935. This indicates that if product quality (X1) and service quality (X2) = 0, customer loyalty increases by 9,935. The coefficient X1b1 = 0,377 means that every increase of 1 unit of product quality increases loyalty by 0,377. The service quality coefficient X2b2 = 0,457 means that a 1-unit increase in service quality increases customer loyalty by 0,457. Simultaneous Test (F Test) tests whether the independent variables together have a significant effect on the dependent variable (Mardiatmoko, 2020). With the decision: If the sig value is <0.05 or F count> F table, then there is an effect of variable X simultaneously on variable Y. If the sig value is> 0.05 or F count < F table, then there is no effect of variable X simultaneously on variable Y.

F table = F (k; n-k) F table = F (4; 95)

F table = F (4; 97-2) Thus, the F table value is 2,47

Table 11. Result of Hypothesis (F-Test)

ANOVA[a]

Model		Sum of Squares	df	Mean Square	F	Sig.
1	Regression	1422.703	2	711.352	736.575	.000[b]
	Residual	90.781	94	.966		
	Total	1513.485	96			

The test results show the significance of the effect of X1 and X2 on Y of 0.000 <0.05 and F count 736.575> 2.47, so that X1 and X2 simultaneously affect Y. According to (Mardiatmoko, 2020) Partial Test (T test) is used to determine whether the independent variable regression model partially has a significant effect on the dependent variable. With the decision: If the sig value <0.05 or t count> t table then there is an influence of variable X on variable Y. If the sig value is> 0.05 or t count < t table then there is no influence of variable X on variable Y.

t table = t (α/2 ; n-k-1) t table = t (0,025 ;94)

t table = t (0,05/2 ; 97-2-1) Thus the t table value is 1.986.

Table 12. Result of Hypothesis (t-Test)

Model		Unstandardized Coefficients		Standardized Coefficients	t	Sig.
		B	Std. Error	Beta		
1	(Constant)	9.935	1.113		8.930	.000
	Product Quality	.377	.045	.464	8.390	.000
	Service Quality	.457	.047	.533	9.628	.000

The table above shows significant probabilities for X1, X2, and Y (0.000 < 0.05), and the t-counts for product quality (X1) (8.390) and service quality (X2) (9.628) exceed the t-table (1.986). So, product quality (X1) and service quality (X2) affect customer loyalty (Y).

4. Conclusion

Based on the findings, it is concluded that both product and service quality have a significant, positive effect on customer loyalty at Oddete Resto. The study found that 94% of customer loyalty is influenced by these two factors, highlighting their critical importance for the restaurant's business continuity.

Abstract

Coffee shops have evolved from simple beverage providers into modern, comfortable spaces with fast internet and workspaces that support productivity and creativity. This quantitative study, using an associative strategy at Cafe Senorita Coffee.21 Medan found that product quality and customer experience significantly affect purchase decisions. The correlation value (r) of 0.493 indicates a strong relationship between the variables and purchasing decisions. The R-squared value of 0.228 shows a partial effect of 22.8%. Both the t-test and F-test confirmed a significant influence: the t-test showed a significant probability for product quality and customer experience, and the F-test indicated a simultaneous significant effect with a value of 0.000.
Keywords: Product quality; Customer experience; Purchase decision.

1. Introduction

Coffee shops have become a symbol of modern society's lifestyle shift. In the digital era, they've transformed beyond places to drink coffee, now offering high-quality beverages, a relaxed atmosphere, and modern facilities like fast internet and workspaces. This evolution meets not only the need for caffeine but also social and environmental needs that support creativity and productivity. Coffee shops have evolved from a simple roadside shop to a more sophisticated space offering quality coffee, a relaxed atmosphere, and modern amenities. These places not only satisfy customers' caffeine needs but also provide a supportive social environment in which to work or relax. A customer's decision to buy from a coffee shop often depends on factors such as the quality of the coffee, the comfort of the space, and the level of customer service. Ultimately, customers choose places that align with their lifestyle and provide a satisfying experience. According to Tjiptono (2019), a purchase decision is the final stage of a process where consumers recognize a problem, seek information, and evaluate alternatives.

According to Tjiptono(2019), a purchasing decision is a process in which consumers recognize their problems, seek information about certain products or brands and evaluate how well each alternative can solve their problems, which then leads to a purchasing decision, while according to Arfah(2022) purchasing decisions area thought process in which an individual evaluates various options and makes a choice on a product from among many choices. Anggraini et al. (2022) state that product quality can be measured by its longevity can last a long time so that we can trust our products. From a marketing perspective, we can see that a quality measure encompasses perceptions of a buyer's quality and the quality of the product, while Darma (2021) suggests that overall product quality has characteristics and a nature that affect its ability to satisfy consumers. The better the quality of our products, the newer variants we make so that consumers are interested in our products. Customer experience is a response given by customers based on personal experience which is the result of an interaction either directly or indirectly, while Hidayat (2021) argues that a good customer

experience can meet customer needs and create trust in customer memory so that it can form feelings of pleasure, attachment, and strong emotional feelings towards the company.

Cafe Senorita Coffee.21, located in Medan since 2019, is a popular vegetarian cafe known for its unique combination of Western flavors and sustainable values. Despite its popularity, the cafe faces problems, including customer complaints about product quality (e.g., coffee that is too sweet or food that is too bland) and a poor customer experience due to long waiting times. These issues can cause customers to consider other cafes with a better taste and service experience. The sales data from 2023 also show fluctuating sales, reinforcing the need to investigate factors influencing consumer purchase decisions.

*Cafe*Senoritacoffee.21 has succeeded in creating a unique experience for consumers and is also one of the most popular coffee shops in Medan. This is evident from the number of sales that occurred throughout 2023. However, even though it is quite popular, this is not far from several problems that occurred when Cafe Senoritacoffee.21 was in production. Based on information obtained by the author from the cafe employees, there were complaints from customers regarding the quality of the coffee products served, being too sweet, and the food served being too bland. Several customers who have bought at the Senorita coffee.21 cafe also complained about the less than satisfactory taste of the coffee. In addition, the customer experience is getting worse because the waiting time for food is too long. These problems cause customers to consider continuing to buy at the Senorita coffee. 21 cafe or choosing another cafe that offers a better taste and service experience.

Table 1. Senoritacoffee.21 sales data 2023

Month	Amount
January	Rp43,013,750
February	Rp32,863,400
March	Rp33,353,750
April	Rp33,532,750
May	Rp39,752,860
June	Rp36,813,000
July	Rp32,537,000
August	Rp27,745,500
September	Rp34,220,899
October	Rp33,603,000
November	Rp34,695,500
December	Rp34,442,500

From the data above, the sales of Cafe Senoritacoffee.21 experienced an increase and a decrease in sales. Cafe Senoritacoffe.21 is very comfortable for a place to relax and comfortable to gather with friends and family or just enjoy a cup of coffee while enjoying a comfortable place.

2. Methodology

According to Janna & Herianto (2021), quantitative data is a research method based on a positivistic approach, research data in the form of numbers that will be measured using statistics as a calculation test tool, related to the problem being studied to produce a conclusion. Positivist philosophy is used in certain populations or samples. The strategy used in this research is to use an associative research strategy. According to Sugiyono (2019) associative research is a research problem formulation that is intended to ask about the relationship between two or more variables. In this study, an associative research strategy was used to identify the extent of the influence of variable X (independent variable) consists

of product quality (X1), and *customer experience*(X2), against variable Y, namely the purchasing decision (dependent variable), either partially or simultaneously.

3. Results and Discussion

According to Maryati (2022), the normality test is carried out to test whether the residual variables are normally distributed in a regression model. A good regression model has residual variables that are normally distributed. The normality test in this study used the one Kolmogorov-Smirnov test, using the SPSS 25 program. The data is declared normally distributed if the significance is greater than 0.05.

Table 2. Normality Test Results

N		X1	X2	Y
		100	100	100
Normal Parametersa,b	Mean	43.00	69.33	45.15
	Std. Deviation	4,623	8,019	3,644
Most Extreme Differences	Absolute	,093	,103	,108
	Positive	,067	,092	,092
	Negative	-,093	-,103	-,108
Test Statistics		,093	,103	,108
Asymp. Sig. (2-tailed)		,031c	,010c	,006c

From table 2, it can be seen that the significance value (Asymp. Sig . 2-tailed) of Kolmogorov-Smirnov is (X1) 0.31,, X2, 0.10 and Y, 0.06. Where the value is greater than 0.05, it is concluded that the residual value is normally distributed. According to Maharani et al. (2023), multicollinearity testing aims to test whether the regression model finds a correlation between independent variables.

Table 3. Multicollinearity Test

Model		Unstandardized Coefficients		Standardized Coefficients	t	Sig.	Collinearity Statistics	
		B	Std. Error	Beta			Tolerance	VIF
1	(Constant)	27,707	3,171		8,736	,000		
	X1	,183	,096	,232	1,909	,059	,527	1,899
	X2	,138	,055	,304	2,496	,014	,527	1,899

In the table above, the correlation value for the tolerance value variable (X1) Product quality is 0.527> 0.10 and the VIF value of Product quality is 1.899 <10.00, (X2) Customer Experience has a tolerance value of 0.527> 0.10 and a VIF value of 1.899 <10.00. It can be concluded that this regression model is free from multicollinearity symptoms and is suitable for use. Heteroscedasticity means the variance of disturbance variables is not constant. The heteroscedasticity test is used to test whether the variance of the residuals differs across observations.

Table 4. Heteroscedasticity Test

Model		Unstandardized Coefficients		Standardized Coefficients	t	Sig.
		B	Std. Error	Beta		
1	(Constant)	5,029	1,815		2,770	,007
	X1	-,089	,055	-,222	-1,612	,110
	X2	,019	,032	,084	,612	,542

In the table above, it can be seen that the correlation value for the significant value variable (X1) Product quality is 0.110 > 0.05, and (X2) Customer Experience has a significant value of 0.542 > 0.05. It can be concluded that this regression model is free from heteroscedasticity

symptoms and is suitable for use. The direction is expressed in the form of positive and negative relationships, while the strength or weakness of the relationship is expressed in the magnitude of the correlation coefficient (Purnama, 2023).

Table 5. Correlation Coefficient Test

Model	R	R Square	Adjusted R Square	Std. Error of the Estimate
1	,493a	,243	,228	3,203

From the results above, it can be concluded that the variables product quality (X1), customer experience (X2), and purchasing decisions (Y) are related, as the values show positive correlations. The correlation value (r) is 0.493, which means that product quality and customer experience have a strong relationship to purchasing decisions. Determination analysis (R2) is used to measure how well the model is able to explain the variation of the dependent variable. The determination coefficient value is 0 or 1. A small R2 value means that the ability of the dependent variables is very limited. A value close to 1 means that the independent variables provide almost all the information needed to predict the variation of the dependent variable (Pranatawijaya et al., 2019).

Table 6. Coefficient of Determination Test

Model	R	R Square	Adjusted R Square	Std. Error of the Estimate
1	,493a	,243	,228	3,203

From the table above, the magnitude of the influence of product quality and customer experience on purchasing decisions is 22.8%. Multiple linear regression is used to find the influence of two or more independent variables (X) on the dependent variable (Y). According to [11], multiple linear regression analyzes the effect of two or more independent variables (X) on the dependent variable (Y)

Table 7. Multiple Linear Regression Test

Model		Unstandardized Coefficients		Standardized Coefficients	t	Sig.	Correlations		
		B	Std. Error	Beta			Zero order	Partial	Part
1	(Constant)	27,707	3,171		8,736	,000			
	X1	,183	,096	,232	1,909	,059	,441	,190	,169
	X2	,138	,055	,304	2,496	,014	,464	,246	,220

In the table above, it is known that in the Unstandardized Coefficients section B, the multiple linear regression equation is obtained using the following formula:

Purchase decision = 27.707 + 0.183 Product quality + 0.138 customer experience

Based on the equation above, it can be explained as follows:
a) Constant (α) = 27.707 shows the constant value. If the value of the independent variable X1, namely product quality, and the value of the variable X2, namely customer experience, are 0, then customer loyalty will increase by 27.707.
b) Coefficient X1b1 = 0.183 shows that the product quality variable (X1) has a positive effect on purchasing decisions by 0.183. This means that for every 1 unit increase in product quality (X1), the product quality on purchasing decisions will increase by 0.183.
c) The coefficient X2b2 = 0.138 shows that the customer experience variable (X2) has a positive effect on purchasing decisions by 0.138. This means that for every 1 unit increase in

customer experience (X2), the customer experience on purchasing decisions will increase by 0.138.

Basis for decision making:

a) If the sig value < 0.05, or t count > t table, then there is an influence of variable X on variable Y.

b) If the sig value > 0.05 or t count < t table, then there is no influence of variable X on variable Y.

Table 8. T-test

Model		Unstandardized Coefficients		Standardized Coefficients	t	Sig.
		B	Std. Error	Beta		
1	(Constant)	27,707	3,171		8,736	,000
	Product Quality	,183	,096	,232	1,999	,059
	Customer Experience	,138	,055	,304	2,496	,014

Based on the results of the table above, it can be seen that the significant probability figure for the Product quality variable (X1) is 0.005 < 0.05 and the customer experience variable (X2) is 0.000 < 0.05, the calculated t value for the product quality variable (X1) is 1.999 > 1.98552 t table, the calculated t value for the customer experience variable (X2) is 2.496 > 1.98552 t table so it can be concluded that there is an influence between variable X1 on variable Y and X2 has an influence on variable Y. The Simultaneous Test (F Test) tests whether the independent variables together have a significant effect on the dependent variable (Tua & Andariyani, 2022). Basis for decision making:

a) If the sig value < 0.05, or F count > F table, then there is a simultaneous influence of variable X on variable Y.

b) If the sig value > 0.05 or F count < F table then there is no simultaneous influence of variable X on variable Y.

Where the F table value is 2.47.

Table 9. F Test

Model		Sum of Squares	df	Mean Square	F	Sig.
1	Regression	319,874	2	159,937	15,594	,000b
	Residual	994,876	97	10,256		
	Total	1314,750	99			

Based on the test results above, it is known that the significance value for the influence of X1 and X2 simultaneously on Y is 0.000 < 0.05, and the calculated F value is 15.594 > F table 2.47, so it can be concluded that there is a simultaneous influence of X1 and X2 on Y.

From the analysis carried out, the following research results were obtained by the researcher:

1. The results of the correlation coefficient test can be concluded that the variables of product quality (X1), customer experience (X2), and purchasing decisions (Y) are related because the values show positive results. The correlation value (r) is 0.493 which means that product quality and customer experience have a strong relationship to purchasing decisions.
2. The results of the determination coefficient test show that the R Square value is 0.228, which means that the partial influence of the product quality variables (X1) and customer experience (X2) on the purchasing decision variable (Y) is 22.8%.Senorita coffee 21.
3. Test results (T)seen that the number significant probability of product quality variable (X1) 1.999 > 1.98552 t table, calculated t value of customer experience variable (X2) 2.496 > 1.98552 t table so it can be concluded that there is an influence of variable X1 on variable Y, and X2 has an influence on variable Y.

4. Test results (F)It is known that the significance value for the influence of X1 and X2 simultaneously on Y is 0.000 < 0.05 and the calculated F value is 15.594 > F table 2.47, so it can be concluded that there is a simultaneous influence of X1 and X2 on Y.

4. Conclusion

Based on the analysis, the research concludes that product quality (X1) and customer experience (X2) influence purchasing decisions (Y) at Cafe Senorita Coffee.21 Medan. Relationship between Product Quality and Customer Experience with Purchasing Decisions:

i. The results of the correlation coefficient test show that there is a positive relationship between product quality and customer experience with purchasing decisions, with a correlation value (r) of 0.493. This means that both variables have a fairly strong relationship with purchasing decisions at Cafe Senorita Coffee.21 Medan.
ii. Partial Influence of Product Quality and Customer Experience on Purchasing Decisions : Based on the R Square value of 0.228, it is known that product quality and customer experience partially influence purchasing decisions by 22.8%. This shows that most of the variability in purchasing decisions can be explained by product quality and customer experience.
iii. The Simultaneous Influence of Product Quality and Customer Experience on Purchasing Decisions: The F test results show a significance value of 0.000, which is smaller than 0.05, and the calculated F value is 15.594, which is greater than the F table of 2.47. This indicates that there is a significant influence of product quality and customer experience simultaneously on purchasing decisions. In other words, product quality and customer experience simultaneously influence consumer purchasing decisions at Cafe Senorita Coffee.21 Medan.

This conclusion confirms that both product quality and customer experience play an important role in influencing consumer purchasing decisions at Cafe Senorita Coffee.21 Medan, both partially and simultaneously. This study provides valuable insights for cafe management to continue improving product quality and customer experience, to encourage better customer purchasing decisions.

THE INFLUENCE OF SERVICE QUALITY AND PRODUCT QUALITY REGARDING PURCHASING DECISIONS AT VEGETARIAN THANKSGIVING MEDAN VEGETARIAN

John Nelson, Dewi Anggraini*

International Marketing Management Study Program, Polytechnic Cendana, 20153 Medan, North Sumatra, Indonesia

*Corresponding author e-mail address: dewifar.27@gmail.com

Abstract

Product quality is defined as the standard of goods and products offered to consumers to fulfill their needs and desires. Service quality refers to the actions and activities of businesses to ensure customer satisfaction. This study was conducted to determine if service quality and product quality collectively influence purchasing decisions at Syukur Vegetarian Restaurant in Medan. Using a quantitative method, data was collected from 96 customers through a non-probability sampling method. The determination test showed that the influence of service quality (X1) and product quality (X2) on purchasing decisions (Y) is 49.1%. This indicates that these two factors have a significant influence on purchasing decisions, with the remaining influence coming from other factors not examined in this study.
Keywords: Service quality; Product quality; Buying decision.

1. Introduction

The food service industry is experiencing rapid growth, from small cafes to large-scale restaurants. For a business to succeed in a competitive market, it must offer high-quality products with competitive value and efficient service. It is important for businesses to understand consumer behavior and purchasing decisions, especially in the restaurant sector. A purchasing decision is a process in which an individual chooses from various alternatives, representing the first step in the decision-making process. According to Tjiptono, a purchasing decision is part of consumer behavior, which involves the acquisition and identification of products and services.

Service quality is defined as the level of excellence expected and controlled to meet customer desires. It can also be seen as a system that provides what the public needs, whether organized by the government or private companies. Product quality is a primary concern for producers. It shows the level of a brand's or product's expertise in performing its role and meeting expectations. According to Kothler & Amstrong in (Marbun et al., 2022) Purchasing decisions are problem solving by individuals by choosing behavioural alternatives and are considered the most appropriate action in purchasing by taking the first step of the decision making process.

Meanwhile, according to Tjiptono in (Cahya et al., 2021)states that purchasing decisions are part of consumer behavior. Consumer behavior is an action that is directly related to the acquisition and identification of products and services, including the decision-making process before and after the action.According to Tjiptono in(Sari & Suprajang, 2020)states that "Service quality is the level of excellence expected and control over that level of excellence to meet customer desires." Tourism service quality is an attraction that includes the uniqueness of the spatial layout (landscape) and beauty.

According to Fandy in (Saefullah, 2022) Service quality is a system that provides something that the public needs, organized by the government or private companies; organizations that

provide something to the public or do something for the government; businesses whose work is doing something for customers but not producing goods; certain skills or assistance that someone can offer; and the condition or position of being a servant or helper. According to Tjiptono & Chandra in (Putri et al., 2021) explains that product quality is something that is offered to consumers which can be in the form of goods or services to meet the needs and desires of customers which can then be used or felt by customers.

Meanwhile, according to Assauri in (Cesariana et al., 2022) Product quality is the main important thing that needs attention from producers/industry. Quality is the main equipment to achieve product position. Quality shows the level of expertise of a brand or product in performing its role and expectations. Product quality can be seen from the size of how long the product lasts, so that it can be trusted by consumers. Syukur Vegetarian Restaurant, established in 2013 in Medan, is known for its vegetarian dishes made from plants, vegetables, and nuts. Although the restaurant is popular, interviews with customers in April revealed some shortcomings.

Customers complained about long waiting times during peak hours and that the food was not properly cooked, affecting its taste and texture. This has led to an interest in researching the influence of service quality and product quality on purchasing decisions at the restaurant. Although Syukur restaurant is famous and serves quality and healthy vegetarian food, there are still some shortcomings in both the quality and product quality.Some customers complain about the food ordering system as well as the taste of the food itself. During peak hours, customers experienced long waiting times and in some cases the food was not properly cooked, affecting the taste and texture. This information was obtained by researchers through interviews conducted in early April.

2. Methodology

According to Hoy & Adam in the book (Hasibuan et al., 2022) Quantitative research is a systematic scientific study of the parts and phenomena and their relationships. According to (Balaka, 2022) Quantitative Research Method is a research method that uses data, namely numbers that are emphasized on objective measurement of results accompanied by statistical analysis/numbers used in statistical analysis from an objective scale to measure units of analysis called variables.

3. Results and Discussion

Normality test is conducted to determine whether the data taken from the population is normally distributed or not. Normality testing in this study uses Kolmogorov-Smirnov. Data are considered normally distributed if the p-value is > 0.05.

Table 1. Results Normality Test

		Unstandardized Residual
N		96
Normal Parametersa,b	Mean	.0000000
	Std. Deviation	2.80370655
Most Extreme Differences	Absolute	.074
	Positive	.074
	Negative	-.072
Test Statistics		.074
Asymp. Sig. (2-tailed)		.200c,d

Based on the normality test results, the p-value is 0.062 > 0.05, indicating that the residuals are normally distributed.

The Heteroscedasticity Test is carried out to determine whether the data taken from the population shows symptoms of heteroscedasticity or not. According to Suharjo in (Puspa et al., 2021)The heteroscedasticity test is to determine whether in the regression model there is inequality of variance from the residual of one observation to another.

Table 2. Heteroscedasticity Test Results

Model		Unstandardized Coefficients		Standardized Coefficients	t	Sig.
		B	Std. Error	Beta		
1	(Constant)	4.054	2,914		1,391	.168
	Quality of Service	.034	.055	.082	.613	.541
	Product Quality	-.066	.058	-.153	-1.144	.255

In the table above, it can be seen that the correlation value for the significant value variable of service quality0.541 > 0.05 and product quality has a significant value of 0.255 > 0.05. It can be concluded that this regression model is free from heteroscedasticity symptoms and is suitable for use. According to Nugraha in (Fariz Hidayatullah, 2024) the assumption that must be met in regression analysis is the absence of a relationship between independent variables, which is then referred to as multicollinearity. Multicollinearity testing is carried out with a value *Variance Inflation Factor (*VIF) > 10, whereas if the tolerance value > 0.10 and the VIF value < 10 then it is stated that there is no multicollinearity.

Table 3. Multicollinearity Test Results

Model		Collinearity Statistics	
		Tolerance	VIF
1	Quality of Service	.595	1,681
	Product Quality	.595	1,681

In the table above, it can be seen that the correlation value for the service quality tolerance value variable is 0.595> 0.10, and the service quality VIF value is 1.681 <10.00. Product quality has a tolerance value of 0.595> 0.10 and a VIF value of 1.681 <10.00. It can be concluded that this regression model is free from multicollinearity symptoms and is suitable for use. In the context of mathematics, the abilities to solve problems and to communicate mathematically are two skills that are fundamentally linked and cannot be separated in either learning or everyday application.

Table 4. Correlation Coefficient Test Results

		Quality of Service	Product Quality	Buying decision
Quality of Service	Pearson Correlation	1	.636**	.648**
	Sig. (2-tailed)		.000	.000
	N	96	96	96
Product Quality	Pearson Correlation	.636**	1	.618**
	Sig. (2-tailed)	.000		.000
	N	96	96	96
Buying decision	Pearson Correlation	.648**	.618**	1
	Sig. (2-tailed)	.000	.000	
	N	96	96	96

Based on the SPSS “Correlations” output table above, the Pearson correlation between the product quality variable (X1) and customer trust (Y) is 0.000, and the Pearson correlation between the social media marketing variable (X2) and customer trust (Y) is 0.000. The two

asterisks indicate that there is a strong relationship between the product quality variable (X1) and customer trust (Y) and the social media marketing variable (X2) and customer trust (Y). A positive correlation value means that if product quality and social media marketing increase, customer trust will also increase. The coefficient of determination is a value that shows the extent of the contribution of influence given by the independent variable to the dependent variable.

Table 5. Results of the Test of the Determination Coefficient of X1 Against Y

Mode	R	R Square	Adjusted R Square	Std. Error of the Estimate
1	.648 a	.420	.414	3.008

Based on the table above, the R Square value is 0.414, this means that the partial influence of the service quality variable (X1) on the Purchasing Decision variable (Y) is 42% at Syukur Vegetarian, Medan.

Table 6. Results of the X2 Determination Coefficient Test Against Y

Model	R	R Square	Adjusted R Square	Std. Error of the Estimate
1	.618a	.381	.375	3.107

Based on the table above, the R Square value is 0.618. This means that the influence of the product quality variable (X2) on the Purchasing Decision variable (Y) is 38.1% at Syukur Vegetarian, Medan.

Table 7. Results of the Test of the Determination Coefficient of X1 and X2 Against Y

Model	R	R Square	Adjusted R Square	Std. Error of the Estimate
1	.701a	.491	.480	2,834

Based on the table above, the R Square value is 0.491. This means that the influence of the product quality variable (X2) on the Purchasing Decision variable (Y) is 49.1% at Syukur Vegetarian, Medan. Multiple linear regression functions to find the influence of two or more independent variables (X) on the dependent variable (Y).

Table 8. Multiple Linear Regression Test Results

Model		Unstandardized Coefficients		Standardized Coefficients	t	Sig.
		B	Std. Error	Beta		
1	(Constant)	17,310	4,870		3,554	.001
	Product Quality	.347	.097	.344	3,591	.001
	Quality of Service	.412	.092	.429	4.471	.000

In the table above, it is known that in the Unstandardized Coefficients section B, the multiple linear regression equation is obtained using the following formula:
Customer loyalty = 17,310 + 0.347 service quality + 0.412 customer satisfaction
Based on the equation above, it can be explained as follows:

a) The constant (α) = 17.310 shows the constant value, if the value of the independent variable X1, namely service quality and the value of the variable X2, namely customer satisfaction, is 0, then customer loyalty will increase by 17.310.
b) The coefficient X1b1 = 0.412 shows that the service quality variable (X1) has a positive effect on customer loyalty of 0.412. This means that for every 1 unit increase in service quality (X1), the service quality on customer loyalty will increase by 0.412.

c) The coefficient X2b2 = 0.347 shows that the customer satisfaction variable (X2) has a positive effect on customer loyalty of 0.347. This means that for every 1 unit increase in customer satisfaction (X2), customer satisfaction with customer loyalty will increase by 0.437.

In (Novian et al., 2023) the basis for decision making in a joint test (f-test), if the sig value (significance) < 0.05 then the independent or free variables simultaneously influence the dependent or dependent variables, whereas if the sig value (significance) > 0.05 then the independent or free variables simultaneously do not influence the dependent or free variables. Basis for decision making:

a) If the sig value < 0.05, or F count > F table, then there is a simultaneous influence of variable X on variable Y.
b) If the sig value > 0.05 or F count < F table then there is no simultaneous influence of variable X on variable Y.

F table = F(k;nk)
F table = F(4;96-2)
F table = F (4 ; 94)
Where the F table value is 2.47

Table 9. F Test Results

Model		Sum of Squares	df	Mean Square	F	Sig.
1	Regression	719,716	2	359,858	44,815	.000b
	Residual	746,773	93	8,030		
	Total	1466.490	95			

Based on the test results above, it is known that the significance value for the influence of X1 and X2 simultaneously on Y is 0.000 < 0.05 and the calculated F value is 44.815 > F table 2.47, so it can be concluded that there is a simultaneous influence of X1 and X2 on Y. In (Novian et al., 2023)The basis for decision making in a partial test (t-test), if the sig value (significance) < probability 0.05 then there is an influence between the independent variable and the dependent variable, while if the sig value (significance) > probability 0.05 then there is no influence between the independent variable and the dependent variable. Can be done with the following formula:

Basis for decision making:

a) If the sig value < 0.05, or t count > t table, then there is an influence of variable X on variable Y.
b) If the sig value > 0.05 or t count < t table then there is no influence of variable X on variable Y.

t table = t (α/2 ; nk-1)
t table = t (0.05/2 ; 96-2-1)
t table = t (0.025 ;93)
Where the t table value is 1.98580.

Table 10. T-Test Results

Model		Unstandardized Coefficients		Standardized Coefficients	t	Sig.
		B	Std. Error	Beta		
1	(Constant)	17,310	4,870		3,554	.001
	Product Quality	.347	.097	.344	3,591	.001
	Quality of Service	.412	.092	.429	4.471	.000

Based on the results of the table above, the significant probability figures for the service quality variable (X1) are 0.000 <0.05. The product quality variable (X2) is 0.001 <0.05. The customer satisfaction variable is 0.000 <0.05, the calculated t value for the service quality variable (X1) is 4.471> 1.98580 t table, the calculated t value for the customer satisfaction variable (X2) is 3.591> 1.98580 t table so it can be concluded that there is an influence between the X1 variable on the Y variable and X2 has an influence on the Y variable. From the analysis carried out, the following research results were obtained by the researcher:

a) Based on the results of the normality test, the significance value is known.0.062 > 0.05then it can be concluded that the residual values are normally distributed.
b) The results of the multicollinearity test show that the correlation value for the service quality tolerance value variable is 0.966 > 0.10 and the service quality VIF value is 1.035 < 10.00, customer satisfaction has a tolerance value of 0.966 > 0.10 and a VIF value of 1.035 < 10.00. It can be concluded that this regression model is free from multicollinearity symptoms and is suitable for use.
c) The results of the multicollinearity test show that the correlation value for the service quality tolerance value variable is 0.595 > 0.10 and the service quality VIF value is 1.681 < 10.00, customer satisfaction has a tolerance value of 0.595 > 0.10 and a VIF value of 1.681 < 10.00. It can be concluded that this regression model is free from multicollinearity symptoms and is suitable for use.
d) The results of the heteroscedasticity test show that the correlation value for the significant value variable of service quality is 0.541 > 0.05 and customer satisfaction has a significant value of 0.255 > 0.05. It can be concluded that this regression model is free from heteroscedasticity symptoms and is suitable for use.
e) Service quality variable (X1) and product quality (X2) influences purchasing decisions (Y) has a positive relationship and Pearson correlation between the service quality variable (X1) and purchasing decisions (Y) of 0.000, and the Pearson correlation value between the product quality variable (X2) and purchasing decisions (Y) of 0.030.
f) The results of the determination coefficient test show that the R Square value is0.414, this means that the influence of the service quality variable (X1) simultaneously on the purchasing decision variable (Y) is 42% at Syukur Vegetarian, Medan.
g) The results of the determination coefficient test show that the R Square value is 0.618, which means that the influence of the product quality variable (X2) simultaneously on the purchasing decision variable (Y) is 38.1% at Syukur Vegetarian, Medan.
h) The results of the determination coefficient test show that the R Square value is 0.923, which means that the influence of the service quality variables (X1) and product quality (X2) simultaneously on the Purchase Decision variable (Y) is 49.1% at Syukur Vegetarian, Medan.
i) The results of the F test show that the significance value for the influence of X1 and X2 simultaneously on Y is 0.000 < 0.05 and the calculated F value is 44.815 > F table 2.47, so it can be concluded that there is a simultaneous influence of X1 and X2 on Y.

4. Conclusion

Based on the research finding, the author concludes that:

a) The percentage between service quality (X1) and purchasing decisions (Y) is 42%. This proves that service quality influences purchasing decisions by 42% and the remaining is influenced by other factors not examined in this study.
b) The percentage between product quality (X2) and purchasing decisions (Y) is 38.1%. This proves that customer satisfaction affects customer loyalty by 38.1% and the remaining is influenced by other factors not examined in this study.
c) The percentage between service quality (X1) and product quality (X2) on purchasing decisions (Y) is 49.1%. This proves that service quality and product quality influence purchasing decisions by 49.1% and the remaining is influenced by other factors not examined in this study.

THE INFLUENCE OF PRODUCT QUALITY, SERVICE QUALITY, AND PURCHASING DECISIONS AT CAFE LIMA SATU

Elsa Ayunda Kisuanto, Sutarno Sutarno*

International Marketing Management Study Program, Polytechnic Cendana, 20153 Medan, North Sumatra, Indonesia

*Corresponding author e-mail address: Sutarno123@gmail.com

Abstract

This study aims to determine the extent to which product and service quality influence purchasing decisions at Cafe Lima Satu. The method employed in this study is an associative quantitative approach, used to measure relationships between variables. The study involved 71 respondents selected using accidental sampling, a technique in which participants are chosen based on availability and willingness to respond. The results showed that Product Quality and Service Quality together explained 93.4% of the variance in Purchasing Decisions, as indicated by the coefficient of determination. This indicates that these two factors influence most customer purchasing decisions at the cafe. The remaining 6.6% is attributed to other factors not captured in the model, such as price, promotion, location, or individual customer characteristics. This study confirms that factors such as taste quality, product presentation, and the comfort and service provided by employees significantly influence customer purchasing decisions. Thus, management should continue to maintain and enhance product and service quality to sustain and attract consumer interest. The findings also demonstrate that the model employed in this study is both strong and relevant.
Keywords: Product quality; Service quality; Purchasing decisions.

1. Introduction

As urban lifestyles become increasingly fast-paced busier, consumers tend to prefer food options that are convenient and readily accessible. The demand for high-quality food products is rising, pushing businesses to offer superior products at competitive prices. In a competitive market, consumers benefit from a wider range of choices as businesses strive to deliver high quality offerings that attract and retain customers. One noTable player in the vegetarian café industry is Cafe Lima Satu, which specializes in plant-based food and beverages. The café presents a unique concept, catering to health-conscious individuals who prioritize vegetarian or vegan diets. However, beyond the provision of high-quality food, two key factors significantly influence customer purchase decisions in the food and beverage industry: product quality and service quality.

Product quality includes taste, menu variety, and the use of high-quality ingredients in vegetarian meals. Meanwhile, service quality encompasses aspects such as customer service, speed of service, and the availability of menu information. While these factors are essential, there is limited research on how they impact purchasing decisions at Cafe Lima Satu. Given the importance of these elements, this study aims to analyze the influence of product quality and service quality on consumer purchase decisions at Cafe Lima Satu. Understanding these relationships enables businesses to enhance their offerings and develop a competitive advantage in the increasingly dynamic café industry. According to Tjiptono, (Maulidya et al., 2021) product quality is everything that a producer can offer for the attention, demand, search, purchase, use and consumption of the market as a fulfilment or desire of the market concerned.

According to Arianto, (Putra et al., 2023) “Service quality can be defined as focusing on meeting needs and requirements, as well as on timeliness to meet customer expectations”. Customer or consumer expectations must be met as they are the key conditions for service quality to be considered good. Purchasing decisions are problem-solving activities in which individuals select the most appropriate course of action from two or more alternatives. According to the Firmansyah decision-making process (as cited in Octavia et al., 2023) these decisions involve a series of stages before arriving at the final choice. It can be concluded that purchasing decisions are one of the stages of consumer behaviour that underlie consumers making purchasing decisions before post-purchase behaviour and how individuals, groups and organizations choose, buy, use and how goods or services satisfy their needs and wants.

Therefore, it is important for Cafe Lima Satu to pay attention to product quality and service quality to improve customer purchasing decisions and retain existing customers.
According to the information obtained from a customer identified as “G” stated that the service at Cafe Five was perceived as less friendly, making customers feel uncomforTable when making purchases.” Meanwhile, a customer identified as “Y” stated that Cafe Lima Satu guarantees a 100% vegetarian composition, which is very helpful for individuals who adhere to vegetarianism.

2. Methodology

The research method used in this study is quantitative methods. According to Sugiyono, as cited in (Abyan & Rohana, 2022) the quantitative approach is a research method based on the philosophy of positivism. It involves studying specific populations or samples often using random sampling techniques with data collected through research instruments and analyzed statistically. This study aims to test a previously established hypothesis. To achieve this, the author employs an associative quantitative research method, which is used to examine the relationship between two or more variables through statistical analysis.

Table 1. Definition Operational

Variable	Definition	Indicator	Measurement Scale
Product Quality (X1)	According to Nasution (2005), the definition of product quality is the alignment between products, synergized teams, processes and work and the company environment which ultimately exceeds customer expectations.	• Performance • Reliability • Design • Durability and robustness • Perceived quality • Additional features	Likert
Service Quality (X2)	The definition of service quality can be interpreted as an effort to fulfill the needs and desires of consumers and the accuracy of their delivery in balancing consumer expectations. Quoted from (Anim & Putu, 2020).	• Physical evidence • Reliability • Guarantee • Empathy • Responsive day	Likert
Purchasing decision (Y)	The definition of a purchasing decision is a decision process taken by consumers in assessing a product they want to buy. Quoted from (Barus et al., 2021).	• Problem recognition • Information search • Evaluation of alternatives • Purchase decision • Post-purchase behavior	Likert

According to Sudaryono (Ana, 2022), a population is defined as the generalization area consisting of objects or subjects that possess certain qualities and characteristics determined for research, from which conclusions can be drawn. In this study, the population comprised all customers who made purchases at Café Lima Satu, although the exact number was unknown. When a population is too large to study in its entirety due to time, resource, or cost constraints, researchers may use a sample drawn from the population. In this study, the researchers employed the Accidental Sampling technique, a non-probability sampling method in which respondents are selected based on chance, that is, anyone who happens to meet the researcher and is deemed suiTable as a data source is included as a sample.

The following are commonly used research data collection techniques: tests, interviews, observations, questionnaires, surveys, and document analysis. According to Sujarweni (2018: 120), (Nafis et al., 2021) a questionnaire is a method of collecting data by providing respondents with written questions or statements to which they respond. In this study, a closed questionnaire was employed. In this type of questionnaire, answer choices are predetermined, and respondents are required only to select the option that best represents their response. In this study, the researcher used Likert scale as the measuring tool. The Likert scale is a technique commonly used in questionnaires to measure respondents' attitudes, opinions, or perceptions of something.

Table 2. Score Likert

Description	Symbol	Score
Strongly Agree	SA	5
Agree	A	4
Neutral	N	3
Disagree	D	2
Strongly Disagree	SD	1

3.0 Results and Discussion

The number of respondents in this study was 71 people, categorized by gender as shown in the following Table. Based on Table 3, it can be concluded that 71 respondents are namely male 29 people (40.85%) and female 42 people (59.15%). This showed that most of the respondents are female respondents.

Table 3. Description of characteristics of research subjects based on gender

No.	Gender	Tota (Person)	Percentage
1.	Male	29	40,85%
2.	Female	42	59,15%
	Total	71	100%

According to Sugiyono, (Sugiono et al., 2020), validity can be interpreted as the level of accuracy of the measuring instrument in measuring the intended concept. According to Widiyanto, (Hakim et al., 2021) validity refers to the extent to which a questionnaire accurately measures the variables under study. A valid instrument ensures that the data collected are appropriate for measuring the intended constructs. There are two commonly used methods for testing validity. The first is the Pearson correlation, and the second is the correlated item–total correlation.

Table 4. Result of validity and Reliability

No. X1	Corr. Items	Cronb. Alpha	No. X2	Corr. Items	Des	Cronb. Alpha	No. Y	Corr. Items	Cornb. Alpha
X1	0,679		X1	0,676	Valid		Y1	0,66	
X2	0,557		X2	0,768	Valid		Y2	0,765	

X3	0,654		X3	0,657	Valid		Y3	0,554	
X4	0,688	Reliable	X4	0,677	Valid	Reliable	Y4	0,735	Reliable
X5	0,558	0,804	X5	0,676	Valid	0,860	Y5	0,656	0,864
X6	0,553		X6	0,653	Valid		Y6	0,653	
X7	0,503		X7	0,68	Valid		Y7	0,688	
X8	0,612		X8	0,696	Valid		Y8	0,59	
X9	0,626		X9	0,644	Valid		Y9	0,745	
X10	0,634		X10	0,632	Valid		Y10	0,737	
X11	1		X11	1	Valid		Y11	1	

Table 4 shows each variable-product quality (X1), service quality (X2), and purchasing decisions (Y)-consists of 10 valid question items with a corrected correlation value of more than 0.3. The three variables meet the reliability criteria with a Cronbach's Alpha value of more than 0.60, especially product quality with a value of 0.804. Thus, the variables of service quality and purchasing decisions are also declared reliable.

According to Ghozali, (Hutapea & Ghozali, 2022) the normality test is carried out to test whether in a regression model, an independent variable and the dependent variable or both have a normal or abnormal distribution. If the distribution results show that the data is normal or close to normal, then the regression model can be considered good. To determine whether the data are normally distributed in SPSS, the Kolmogorov-Smirnov Test can be used. Kolmogorov Smirnov tests with the provisions the significant value> 5% or 0.05% then the data has a normal distribution. If the significant value <0.05% or 5%, then the data has an abnormal distribution.

Table 5. Result of Normality Test

One-Sample Kolmogorov-Smirnov Test		
		Unstandardized Residual
N		71
Normal Parameters[a,b]	Mean	0,0000000
	Std. Deviation	0,82731114
Most Extreme Differences	Absolute	0,099
	Positive	0,082
	Negative	-0,099
Test Statistic		0,099
Asymp. Sig. (2-tailed)		.083[c]

Based on the results of the normality test using the Kolmogorov- Smirnov test on SPSS 25 (Table 5). The significance value (Asymp.Sig) is 0.083> 0.05, it can be concluded that the residual value is normally distributed and can be carried out for further research. According to Duli (2019: 120), the multicollinearity test aims to see whether there is a high correlation between the independent variables in a multiple linear regression model. Multicollinearity occurs when there is a strong relationship between two or more independent variables in the regression model. This symptom can be detected by checking the Variance Inflation Factor (VIF) and Tolerance. If the VIF value is less than 10 and the Tolerance value is greater than 0.1, it can be concluded that there is no multicollinearity in the model.

Table 6. Result of Multicollinearity Test

Model		Collinearity Statistics	
		Tolerance	VIF
1	Product Quality	.182	5.499
	Service Quality	.182	5.499

Based on the test results in the Table above, the tolerance value of product quality and service quality is 0.182 ≥ 0.10 and the VIF value is 5.499 ≤ 10. Therefore, it can be concluded Multicollinearity is not present. According to Ghozali, (Akbar et al., 2023) Heteroscedasticity

can be tested using the Glejser approach in SPSS. If the significance probability value is greater than the confidence level > 0.05, it can be concluded that there is no heteroscedasticity. Vice versa, if the significance probability value is less than the confidence level, namely <0.05, it can be concluded that heteroscedasticity is present in the modal (Ghozali, as cited in Chandra et al., 2023).

Table 7. Result of Heteroscedasticity Test

Model		Unstandardized Coefficients B	Unstandardized Coefficients Std. Error	Standardized Coefficients Beta	t	Sig.
1	(Constant)	-0,135	0,714		-0,189	0,850
	Product Quality	0,06	0,044	0,381	1,363	0,177
	Service Quality	-0,04	0,045	-0,246	-0,881	0,381

Table 7 shows that the product quality sig value is 0.177 > 0.05 and the service quality sig value is 0.381 > 0.05, indicating that there is no heteroscedasticity. According to Sugiyono (2019) and Chandra et al. (2023), the correlation coefficient is a measure of the strength of the relationship between two or more variables. The product-moment correlation coefficient is a correlation technique used to find relationships and prove the hypothesis of a relationship between two variables when the data from the two variables are the same.

Table 8. Result of Correlation Coefficient Test

		Product Quality	Service Quality	Purchase Decision
Product Quality	Pearson Correlation	1	.905**	.964**
	Sig. (2-tailed)		0,000	0,000
	N	71	71	71
Service Quality	Pearson Correlation	.905**	1	.902**
	Sig. (2-tailed)	0,000		0,000
	N	71	71	71
Purchase Decision	Pearson Correlation	.964**	.902**	1
	Sig. (2-tailed)	0,000	0,000	
	N	71	71	71

Based on the Table above, the correlation of Product Quality (X1) is 0.964> 0.5 - <1, the correlation of Service Quality (X2) is 0.902> 0.5 - <1, which indicates that both variables have a strong positive correlation. According to Ghozali (2018: 97), (Rahardjo & Yulianto, 2022) the coefficient of determination (R^2) measures the extent to which a model can explain the variations in the dependent variable. The coefficient of determination (R square or R squared) symbolized by "R^2" shows the magnitude of the contribution of the influence given by the independent variable (X) to the dependent variable (Y). The coefficient of determination or R square is useful for predicting and seeing how much influence the X variables contribute simultaneously (together) to the Y variable.

Table 9. Result of Coefficient Determination

Model	R	R Square	Adjusted R Square	Std. Error of the Estimate
1	.966[a]	0,934	0,932	0,839

Based on Table 9, the coefficient of determination (R^2) of the R-squared value is 0.934, indicating that the effect of the independent variable (X) on the dependent variable (Y) is 93.4%. A Multiple Linear Regression is a statistical model that examines the relationship

between a dependent variable and two or more independent variables (also called predictors). In multiple linear analysis, the dependent variable is influenced by more than one independent variable (Arikunto, Rismawati, 2022).

Table 10. Result of Multiple Linear Regression Test

Model		Unstandardized Coefficients B	Unstandardized Coefficients Std. Error	Standardized Coefficients Beta	T	Sig.
1	(Constant)	5,227	1,112		4,701	0,000
	Product Quality	0,774	0,069	0,817	11,190	0,000
	Service Quality	0,156	0,070	0,163	2,226	0,029

$$Y = 5{,}227 + 0{,}774\ X1 + 0{,}156\ X2 + e \quad (1)$$

Purchasing decisions are influenced by product and service quality. Product quality has a greater impact (0.774) than service quality (0.156). This means that improving product quality is more significant in driving purchases, but service quality still plays a role. Ghozali, (Lestari & Ardini, 2023) states that the t test is used to test the extent to which the independent variable partially affects the dependent variable.

Table 11. Result of Hypothesis (T-Test)

Model		Unstandardized Coefficients B	Unstandardized Coefficients Std. Error	Standardized Coefficients Beta	t	Sig.
1	(Constant)	5,227	1,112		4,701	0,000
	Product Quality	0,774	0,069	0,817	11,190	0,000
	Service Quality	0,156	0,070	0,163	2,226	0,029

Table 11 shows that the significance probability of the Product Quality variable (X1) is 0.000 < 0.05, indicating that it has a significant partial effect on purchasing decisions (Y). Meanwhile, the significance value for the significance of the Service Quality variable (X2) is 0.029 <0.05, indicating that it also partially affects purchasing decisions (Y)

The F test, or Fisher's test, is a statistical method used to test hypotheses on the variability of two or more groups of data. According to Sugiyono, (Santosa, 2020) the F test is examined by using the following formula:

$$F = \frac{R^2/k}{(1-R^2)/(n-k-1)} \quad (2)$$

Table 12. Result of Hypothesis (F-Test)

Model		Sum of Squares	df	Mean Square	F	Sig.
1	Regression	678,962	2	339,481	481,824	.000[b]
	Residual	47,911	68	0,705		
	Total	726,873	70			

Table 12 shows that the significance figure is 0.000 < 0.05, indicating that the variables Product Quality (X1) and Service Quality (X2) simultaneously affect Purchasing Decisions (Y).

4.0 Conclusion

The conclusion of this study is that product quality and service quality have a positive and significant influence on purchasing decisions at Café Lima Satu, both individually and simultaneously. Enhancing product quality to meet customer expectations and improving service quality are likely to encourage increased purchasing decisions. These findings demonstrate that both factors play a crucial role in attracting and retaining customers.

Abstract

This study aims to analyze the Influence of Customer Value and Service Quality on Strawberry Veggie Customer Loyalty. This study uses quantitative methods which can be defined as a research approach based on the philosophy of positivism. In this approach research is conducted on a specific sample often selected using random sampling techniques. Customer value indicators include quality values, emotional values, and social values. The indicators of service quality are reliability, responsiveness, certainty, empathy, and real. Customer loyalty indicators include speaking positively on a brand; recommend it to others and continue to make repeat purchases. Sampling is done using Purposive Sampling with a sample of 97 respondents. The results of the normality test of this study are 0.119 greater than the standard significance 0.05. The results of the coefficient test indicate that there is a relationship between Customer Value and Service Quality on Customer Loyalty, namely 92.9%.The linear regression results show a significance value of 0.000 (< 0.05), indicating that the Customer Value variable (X1) and the Service Quality variable (X2) collectively have a significant effect on Customer Loyalty (Y). The F-test results show a significance value of 0.000 < 0.05, demonstrating that the Customer Value variable (X1) and Service Quality variable (X2) simultaneously have a significant effect on Customer Loyalty (Y).
Keywords: Customer value; Service quality; Customer loyalty.

1. Introduction

Food is a basic human need, and restaurants play an important role in providing it. In response to growing demand, many restaurants now offer vegetarian options, including dishes that use vegeTables as meat substitutes. One example is Strawberry Veggie, which provides a wide variety of vegetarian meals. This restaurant, along with several others in Medan, caters specifically to the needs of vegetarian consumers. According to Kotler, (Brama Kumbara, 2021) customer value is the set of benefits expected by customers from a particular product or service, while total customer cost is the set of expected costs that customers expect to incur in evaluating, obtaining, using and disposing of a product or service

Service quality is the expected level of excellence and control over that level of excellence to meet customer desires. Of course, the embodiment of the service must also be presented as best as possible which is closely related to quality assurance or the good quality presented according to (Kasinem 2020). According to Sambodo Rio Sasongko (2021), customer loyalty is a deeply held commitment to repurchase or continue supporting a preferred product or service in the future, even when situational factors or marketing efforts might encourage switching. In the context of food consumption, many customers make purchases, although some may not always choose the available menu options, as menus often change daily.

Strawberry Veggie Cemara Asri is a restaurant that provides vegetarian food. Established in 2017, it is located at Jalan Strawberry Medan Estate, Percut Sei Tuan District, Deli Serdang Regency, North Sumatra. By improving the quality of service, the restaurant aims to attract more customers and encourage repeat visits. However, some customers have complained

about delays in food service. Based on this issue, this study aims to examine the influence of customer value and service quality on customer loyalty at Strawberry Veggie.

2. Methodology

According to Sugiyono (Andini and Lestari, 2021), quantitative research methods can be defined as research approaches based on the philosophy of positivism. These methods are used to study specific populations or samples, typically selected using random sampling techniques. Data are collected using research instruments and analyzed quantitatively/statistically, with the aim of testing predetermined hypotheses. Whitney (Kartina, 2021) stated that “the descriptive method is the search for facts with the correct interpretation.” Therefore, the descriptive method involves examining facts from the object of study and emphasizes data collection in the form of words or statements. In this study, a descriptive research strategy was employed to determine the extent of the influence of the independent variables Customer Value (X1) and Service Quality (X2) on the dependent variable, Customer Loyalty (Y), both partially and simultaneously.

According to Sugiyono (Purwanto, 2019), research variables are anything the researcher determines to be studied, enabling the collection of information and the drawing of conclusions. In this study, the variables consist of independent and dependent (bound) variables. According to Sugiyono, independent variables are variables that affect or cause the emergence of dependent variables (Kusmiyati Kusmiyati & Nera Marinda Machdar, 2023). The independent variables in this study are Customer Value (X1) and Service Quality (X2). According to Sugiyono, dependent variables are those influenced or determined by independent variables (Kusmiyati Kusmiyati & Nera Marinda Machdar, 2023). In this study, the dependent variable is Customer Loyalty (Y). According to Arikunto,(Syahidin, Syafii, and Sirojuzilam 2022) The operational definition of the variables are as follows:

a. Customer Value can be defined as the ratio between how much the customer earns and how much the customer gives, the customer benefits and incurs costs. According to Sheth, (Brama Kumbara, 2021) customer value is divided into three important components; quality value, social value, emotional value.
b. Service Quality: Service quality is a form of effort to meet the needs and desires of consumers and the accuracy of its delivery in balancing consumer expectations. Tjipto, (Lestari and Iskandar 2021) defines service quality as a form of effort in realizing the needs, desires of buyers, and the accuracy of product delivery in order to keep up with buyers' expectations. There are five indicators of service quality; reliability, responsiveness, assurance, empathy, physical evidence
c. Customer Loyalty: Purchase decisions refer to consumers’ judgments in deciding to buy products or services by considering and evaluating alternatives among various options. According to Bastian (as cited in Ayuningtyas, Santoso, and Winahyu, 2023), customer loyalty indicators include: speaking positively about the product or service, recommending it to others, and making repeat purchases.

Sugiyono,(Yuzairi and Aguss, 2022) defined population as a general domain like objects or subjects with certain qualities and characteristics that are determined by researchers to be investigated and concluded. The population in this study consists of Strawberry veggie customers although the exact number is unknown. According to the researchers, the restaurant receives an average of approximately 30 visitors per day. Sugiyono (Haribowo et al., 2022) defines Purposive Sampling as: "A technique for determining samples with certain considerations”. The sample in this study was selected using the purposive sampling technique because not all potential respondents met the criteria established by the researcher. This technique involves selecting samples based on specific considerations or criteria that must be fulfilled, which are as follows:

a. Consumers must be at least 18 years old ensuring that they can understand the content of the questionnaire.
b. Consumers must have seen and understood Strawberry veggie products.
c. Consumers must have purchased Strawberry veggie products at least once per month
.

Data in this study were collected through the distribution of questionnaires, a method in which respondents complete structured questions. The questions were designed to address the research objectives. The researcher distributed the questionnaires from April 20, 2024, to June 20, 2024, between 11:00 AM and 3:00 PM WIB. A total of 97 respondents successfully completed the questionnaire, in accordance with the predetermined sample size. According to Sugiyono (as cited in Idris, Sugiarto, and M. Saleh, 2019), the Likert scale is used to measure individuals' or groups' attitudes, opinions, and perceptions regarding social phenomena. In this study, the questionnaire employed a Likert scale to collect data.

Table 1. Statement for answers

No.	Statement	Score
1.	Strongly Agree	5
2.	Agree	4
3.	Neutral	3
4.	Disagree	2
5.	Strongly Disagree	1

3. Results and Discussion

Rahmawan and Hidayat (2020) mentioned that "the normality test is a test with the aim of testing whether in the regression model, the disruptive or residual variable has a normal distribution". In this study, the researcher has tested the normality of the data using the Kolmogorov-Smirnov test. The data is normally distributed, if the significance > 0.05.

Table 2 Normality Test Results

		Unstandardized Residual
N		97
Normal Parameters[a,b]	Mean	.0000000
	Std. Deviation	1,98194948
Most Extreme Differences	Absolute	.081
	Positive	.064
	Negative	-.081
Test Statistic		.081
Asymp. Sig. (2-tailed)		.119[c,d]

Based on the results of the normality test using the Kolmogorov–Smirnov test, the significance value was 0.119 (> 0.05), indicating that the residuals are normally distributed. Ghozali, (Rahmawan and Hidayat, 2020) stated that the Linearity Test aims to determine whether two variables have a significant linear relationship. The researcher uses SPSS 22 to conduct a Test for Linearity with a significance of 0.05, with the stipulation that if the Sig. deviation from linearity value > 0.05, then there is a linear relationship between the free variable and the bound variable. On the other hand, if the value of Sig. deviation from linearity < 0.05, then there is no linear relationship between the independent variable and the bound variable.

Table 3. Customer Value Linearity Test Results (X1)

			Sum of Squares	df	Mean Square	F	Sig.
Customer Loyalty* Customer value*	Between Groups	(Combined)	5081.546	31	163.921	44.967	.000
		Linearity	4794.912	1	4794.912	1315.347	.000
		Deviation from Linearity	286.635	30	9.554	2.621	.001
	Within Groups		236.948	65	3.645		
	Total		5318.495	96			

Based on Table 3, the Sig. The value deviation from linearity is 0.001 < 0.05, indicating that there is no linear relationship between the free variable (X1) and the bound variable (Y).

Table 4. Service Quality Linearity Test Results (X2)

			Sum of Squares	df	Mean Square	F	Sig.
Customer Loyalty * Service Quality	Between Groups	(Combined)	5005.614	30	166.854	35.197	.000
		Linearity	4831.621	1	4831.621	1019.196	.000
		Deviation from Linearity	173.993	29	6.000	1.266	.213
	Within Groups		312.881	66	4.741		
	Total		5318.495	96			

Based on Table 4, the value of Sig. deviation from linearity is 0.213, which is greater than 0.05. Therefore, there is a linear relationship between the free variable (X2) and the bound variable (Y). According to Ghozali, (Rahmawan and Hidayat 2020) "multicollinearity testing aims to test whether the regression model finds correlation between independent variables". Researcher uses SPSS 22 to determine the results of the multicollinearity test with the condition of decision-making if the tolerance value is ≥ 0.10 and VIF is ≤ 10, then multicollinearity does not occur.

Table 5. Multicollinearity Test Results

Model		Unstandardized Coefficients		Standardized Coefficients	t	Sig.	Collinearity Statistics	
		B	Std. Error	Beta			Tolerance	VIF
1	(Constant)	2.574	.811		3.175	.002		
	Customer Value	.392	.075	.453	5.231	.000	.101	9.947
	Service Quality	.462	.076	.523	6.043	.000	.101	9.947

Based on the test results of Table 5, the tolerance value of customer value and service quality is 0.101 ≥ 0.10 and the VIF value is 9.947 ≤ 10 showing there is no multicollinearity. According to Ghozali (2018), “the heteroscedasticity test is used to examine whether there is a variance disparity in the residuals of one observation compared to another in a regression model.” In this study, the scatter plot method in SPSS 22 was used to assess heteroscedasticity. Suppose the scatter plot shows no clear pattern and the points are evenly distributed above and below zero on the y-axis. In that case, it indicates that heteroscedasticity is not present, as illustrated in the scatter plot below:

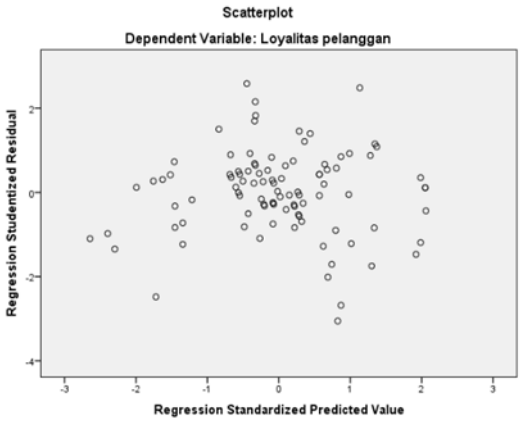

Fig. 1. Heteroscedasticity Test Results

Based on the test results, which meet the previously stated requirements, it can be concluded that heteroscedasticity is absent. To measure the degree of relationship between variable X and variable Y, the researcher calculates the correlation coefficient with the conditions and criteria According to (Lind, Douglas.A., Wathen 2019) the criteria for the strength of the relationship between two variables are as follows:

i. If the correlation value is -1, then the negative correlation is perfect.
ii. If the correlation value is <-1 - <-0.5, then there is a strong negative correlation.
iii. If the correlation value is -0.5, then there is a moderate negative correlation.
iv. If the correlation value is >-0.5 <0, then there is a weak negative correlation.
v. If the correlation value is 0, then there is no correlation.
vi. If the correlation value is >0 -<0.5, then there is a weak positive correlation value.
vii. If the correlation value is 0.5, then there is a moderate positive correlation value.
viii. If the correlation value is >0.5 - <1, then there is a strong positive correlation value.
ix. If the correlation value is 1, then there is a perfect positive correlation value

Table 6. Correlation Test Results

		Customer value	Quality of service	Customer loyalty
Customer value	Pearson Correlation	1	.948**	.950**
	Sig. (2-tailed)		.000	.000
	N	97	97	97
Service Quality	Pearson Correlation	.948**	1	.953**
	Sig. (2-tailed)	.000		.000
	N	97	97	97
Customer Loyalty	Pearson Correlation	.950**	.953**	1
	Sig. (2-tailed)	.000	.000	
	N	97	97	97

Based on the Table above, the correlation of Customer Value (X1) is 0.950 > 0.5 - <1, is the same as the correlation of Service Quality (X2) of 0.953 > 0.5 - <1, showing that both have a strong positive correlation value. According to Sugiyono (Indrawan and Kaniawati Dewi, 2020), the product moment correlation coefficient is a technique used to measure the relationship between two variables and to test the hypothesis regarding their correlation, provided that the data for both variables are of the same type. Researcher used SPSS 22 to determine the results of the determination coefficient test (R^2) with a determination coefficient value between 0 (zero) to 1 (one). A value close to 1 (one) means that the independent variable (X)

provides almost all the information needed to predict the variation of the dependent variable (Y).

Table 7. Determination Coefficient Test Results

Model	R	R Square	Adjusted R Square	Std. Error of the Estimate
1	.964[a]	.929	.928	2.003

Based on Table 8, the value of the determination coefficient (R^2) is 0.929, which means that the influence of the independent variable (X) on the dependent variable (Y) is 92.9%. According to Anwar (2018), the t-test is used to assess the potential of each variable and to determine whether the independent variable (X) is individually related to the dependent variable (Y). Researcher uses SPSS 22 to determine the results of the T-test with the condition of decision-making if the significance < α 0.05. Customer Value Variable (X1) partially affects Customer Loyalty(Y) Service Quality Variable (X2) partially affects Customer Loyalty (Y)

Table 8. T Test Results

Type		Unstandardized Coefficients		Standardized Coefficients	t	Sig.
		B	Std. Error	Beta		
1	(Constant)	2.574	.811		3.175	.002
	Customer Value	.392	.075	.453	5.231	.000
	Service Quality	.462	.076	.523	6.043	.000

T test from Table 9 shows that the probability number of significance of the Customer Value variable (X1) is 0.002 < 0.05 indicates that it is partially affecting Customer Loyalty (Y). Meanwhile, the probability of significance of the Service Quality variable (X2) is 0.000 < 0.05 means that it can partially affect Customer Loyalty (Y). (Anwar 2018)"The F test is used to determine the potentials of the whole of the independent variable (X) whether the two independent variables have a simultaneous effect on the bound variable (Y)". Researcher uses SPSS 22 to determine the results of the F test with the condition of decision-making if the significance of < α = 0.05 then the variables Customer Value (X1) and Service Quality (X2) simultaneously affect Customer Loyalty (Y).

Table 9. F Test Results

Model		Sum of Squares	df	Mean Square	F	Sig.
1	Regression	4941.395	2	2470.697	615.873	.000[b]
	Residual	377.100	94	4.012		
	Total	5318.495	96			

The results of the F test from Table 10 the significance number is 0.000 < 0.05 demonstrate that the variables Customer Value (X1) and Service Quality (X2) simultaneously affect Customer Loyalty (Y). Based on the data analysis conducted by the researcher, the results are as follows:

a. The results of the linearity test indicated that if the significance value for deviation from linearity (Sig.) is greater than 0.05, there is a linear relationship between the independent variable and the dependent variable.*

b. The results of the linearity test showed that if the Sig. deviation from linearity value > 0.05, there is a linear relationship between the free variable and the bound variable.
c. The results of the correlation test showed that the correlation value of Customer Value (X1) and the correlation of Service Quality (X2) > 0.5 - <1, then both had a strong positive correlation value.
d. The results of the determination coefficient test showed that the value of the determination coefficient 〖(R〗^2) of the value of R square is 0.929 which means that the influence of the independent variable (X) on the dependent variable (Y) was 92.9%.
e. The results of the multiple linear test showed that the significance value of < 0.05 indicates that the variables Customer Value (X1) and Service Quality (X2) together had an effect on the Customer Loyalty variable (Y). A regression equation of Y=2.574+0.392X_1+0.462X_2+ε. That is, every time 1 unit of the Customer Value variable (X1) increases, the value of the Customer Loyalty variable (Y) will increase by 0.392 units. Each time 1 unit is added variable Quality of Service (X2), the value of the Customer Loyalty variable (Y) will increase by 0.462 units.
f. The results of the T test showed that the significance probability number is <0.05 thus the variables Customer Value (X1) and Service Quality (X2) partially affected Customer Loyalty (Y).
g. The results of the F test show that the significance number is <0.05 variables Customer Value (X1) and Service Quality (X2) simultaneously affect Customer Loyalty (Y).

4. Conclusion

Based on the test results and analysis, customer value, service quality, and customer loyalty collectively affect customer behavior at Strawberry Veggie. Furthermore, purchase decisions of Strawberry Veggie customers are influenced by service quality and customer loyalty to the tune of 92.9%, while the remaining 7.1% is affected by other factors not included in the model.

THE EFFECT OF COMMUNICATION AND WORK DISCIPLINE ON EMPLOYEE PERFORMANCE AT PT. CIPTAMANDIRI AGUNG JAYA AT MAHA VIHARAMAITREYA MEDAN

Acia Acia[1]*, Weny Weny[2]

[1]International Marketing Management Study Program, Polytechnic Cendana, 20153 Medan, North Sumatra, Indonesia

[2]Company Management Study Program, Polytechnic Cendana, 20153 Medan, North Sumatra, Indonesia

*Corresponding author e-mail address: estindo@gmail.com

Abstract

The purpose of this study is to examine the influence of communication and discipline on employee performance at PT. Cipta Mandiri Agung Jaya, specifically in the Maha Vihara Maitreya environment. Communication is an essential medium in the workplace, while discipline refers to an individual's willingness to comply with and adhere to applicable regulations and norms. Primary data were collected through questionnaires distributed to 97 respondents. The analysis was conducted using the correlation coefficient with the help of SPSS 25. The results of the regression analysis are as follows: Employee Performance (Y) = 7.603 + 0.437X1 + 0.510X2, indicating that every one-unit increase in communication (X1) contributes to a 0.437 increase in employee performance, and every one-unit increase in discipline (X2) contributes to a 0.510 increase. The F-test results show a significance value of 0.000 (< 0.05), indicating that communication and discipline simultaneously have a significant effect on employee performance.
Keywords: Communication; Discipline; Employee performance.

1. Introduction

Communication and discipline are key factors that determine the progress or decline of a company. In organizations with employees who are responsible and highly disciplined, work is performed efficiently and reliably. Effective communication also plays a crucial role in preventing misunderstandings that could lead to losses for the company or organization. To ensure effectiveness, regulations enforcing employee discipline must be clearly established. For these rules to function properly, leaders must set a strong example, as they serve as guides for their subordinates. A leader who demonstrates discipline and provides proper direction can foster high levels of employee performance, ultimately benefiting the organization.

Employees play a critical role in the success of a company. Consistent and diligent employees help the organization achieve its vision and mission more efficiently. However, managing employees can be challenging, especially in large organizations, as each employee has unique thoughts, feelings, status, desires, and backgrounds. Improving communication, work discipline, and work supervision within a company is expected to enhance employee performance, leading to greater job satisfaction and commitment. This, in turn, contributes to the overall advancement of the company and the improvement of the quality of employees' work.

2. Methodology

Quantitative research is a form of research that uses numerical data collection and analytical techniques to test hypotheses, draw conclusions and understand the relationships between the variables being studied. According to scientific sources, quantitative research is generally considered to be an impartial and systematic scientific methodology for collecting measurable data, conducting statistical analysis and drawing conclusions from the resulting data analysis. Quantitative research is a research methodology that uses scientific techniques to collect numerical data, conduct statistical analysis, and draw conclusions based on the findings. The use of quantitative research methodology allows researchers to test hypotheses objectively, draw broader generalizations about the population, and provide strong empirical data to support their conclusions. Through the use of this methodology, scholars are able to understand the relationships between the variables being studied, resulting in a more methodical and reliable understanding of the phenomena being studied (Amruddin et al., 2022).

The indicators contained in quantitative research include:

a. Research variables are ideas, events, or characteristics whose values may fluctuate during a study. Variables can be further divided into dependent variables that are influenced or assessed in the study, and independent variables that influence or are used to predict other factors. For example, physical exercise is an independent variable, and mental health is a dependent variable in a study on the impact of physical exercise on mental health;
b. The research plan or technique used to collect and examine data to provide answers to research questions is known as research design. Depending on the purpose of the research and the type of data collected, the research design may be an experiment, survey, case study, or correlation study. The accuracy and reliability of the research findings will be ensured by an appropriate research design;
c. The methods and tools used to collect information from research participants are called data collection techniques. Some methods that are often used to collect data are surveys, observations, interviews, and secondary data collection. The reliability and validity of the data obtained will be guaranteed by using a methodology that is in accordance with the research objectives and population characteristics; and
d. The process of analyzing research findings and presenting them in an easy-to-understand format, such as Tables, graphs, or reports, is called the interpretation and presentation of results. In order for readers or stakeholders to understand and apply research findings, research results must be presented clearly and accurately (Sena Wahyu [2].

According to Sugiyono (2020), the formulation of problems in a study can be grouped into three forms: descriptive, comparative, and associative. The method that will be used by the author is a quantitative research method with an associative form. A questionnaire is a data collection technique that is carried out by giving a set of written questions or statements to respondents to answer where the Likert scale is used to measure the attitudes, opinions, and perceptions of a person or group of people on social phenomena (Marpaung et al., 2021).

3. Results and Discussion

3.1 Normality Test Results

For statistical analysis, data from each variable must be normally distributed. Before conducting hypothesis testing, a normality test is performed. In this study, the Kolmogorov–Smirnov test using SPSS 25 was employed to assess normality. Data are considered normally distributed if the significance value is greater than 0.05.* According to Ghozali at (Fenny Krisna Marpaung et al., 2021), the normality test aims to test whether in the regression model, the interfering variables or residuals have a normal distribution.

Table 1. Normality Test Results
Kolmogorov-Smirnov Normality Test Results

		Unstandardized Residual
N		96
Normal Parametersa,b	Mean	.0000000
	Std. Deviation	2.62844551
Most Extreme Differences	Absolute	.066
	Positive	.057
	Negative	-.066
Test Statistics		.066
Asymp. Sig. (2-tailed)		.200c,d

a. Test distribution is Normal.
b. Calculated from data.
c. Lilliefors Significance Correction.
d. This is a lower bound of the true significance.

Source: Data processed using SPSS 25 (2024)

From Table 1 the significance value for the variables Communication (X1), Discipline (X2) and Employee Performance (Y) is 0.200 and greater than 0.05, indicating that the data can be distributed normally.

3.2 Multicollinearity Test Results

According to Hidayatullah (2024), the assumption that must be met in regression analysis is the absence of a relationship between independent variables, which is then referred to as multicollinearity. Multicollinearity testing is carried out with a value Variance Inflation Factor (VIF) > 10, whereas if the tolerance value > 0.10 and the VIF value < 10 then it is stated that there is no multicollinearity.

Table 2. Results of Multicollinearity Test Coefficients

Model		Collinearity Statistics	
		Tolerance	VIF
1	COMMUNICATION	.970	1,031
	DISCIPLINE	.970	1,031

Based on the output results of the Table above, it can be seen that the regression model does not have a multicollinearity problem because the VIF value is less than 10 and/or the tolerance value is more than 0.01.

3.3 Heteroscedasticity Test Results

According to Suharjo in Puspa et al. (2021), the heteroscedasticity test is to determine whether in the regression model there is inequality of variance from the residual of one observation to another.

Table 3. Heteroscedasticity Test Results

Model	Unstandardized Coefficients		Standardized Coefficients		t	Sig.
	B	Std. Error	Beta			
1	(Constant)	8.146	3.262		2.498	.015
	X1	-.086	.057	-.170	-1,494	.139
	X2	-.045	.045	-.115	-1.009	.316

Based on Table 3, the regression model does not have a heteroscedasticity problem because the significance value of the Communication (X1) and Discipline (X2) variables is greater than 0.05.

3.4 Determination Test Results

The coefficient of determination (KD) functions to determine the magnitude of the contribution of the independent variable to the dependent variable.

Table 4. Results of Determination Coefficient Test

Model	R	R Square	Adjusted R Square	Std. Error of the Estimate
1	.746a	.556	.546	2,657

The formula for testing the coefficient of determination (R2) is as follows.

KD = R2 X 100%
KD = (0.746)2 X 100%
KD = 56.304%

From the Table 4, it shows that the magnitude of the influence of Communication (X1) and Discipline (X2) on Employee Performance (Y) is 56.304%.

3.5 Multiple Linear Regression Test Results

Table 5. Multiple Linear Regression Results

Model		Unstandardized Coefficients		Standardized Coefficients		
		B	Std. Error	Beta	t	Sig.
1	(Constant)	7,603	3.468		2.192	.031
	COMMUNICATION	.437	.057	.542	7,724	.000
	DISCIPLINE	.510	.058	.615	8,765	.000

Y = a + b1X1 + b2X2
Y = 7.603 + 0.437X1 + 0.510X2

The explanation of the equation above is as follows:

i. If Communication and Discipline improve, Employee Performance will be 7,603.
ii. The Communication Coefficient (X1) is 0.437, which means that if communication improves or gets better, it can increase employee performance by 0.437.
iii. The regression coefficient of discipline (X2) is 0.510, which means that if discipline increases or adds one unit, it can increase employee performance by 0.447.

3.6 Partial Test Results (T-Test)

In Novian et al. (2023), the basis for decision making in a partial test (t-test) is if the sig value (significance) < probability 0.05 then there is an influence between the independent variable and the dependent variable, while if the sig value (significance) > probability 0.05 then there is no influence between the independent variable and the dependent variable.

Table 6. Partial Test (T Test)

Model		Unstandardized Coefficients		Standardized Coefficients		
		B	Std. Error	Beta	t	Sig.
1	(Constant)	7,603	3.468		2.192	.031
	COMMUNICATION	.437	.057	.542	7,724	.000
	DISCIPLINE	.510	.058	.615	8,765	.000

The provisions in the partial test (T test) are as follows: If the significance value is <0.05 then there is an influence of the independent variable on the dependent variable. If the significance value > 0.05 then there is no influence of the independent variable on the dependent variable. Based on the output Table 6 above, it can be seen that the significance value of the communication variable is 0.000, which means it is less than 0.05, so communication has an effect on employee performance and H01 is rejected. The significance value of the discipline variable is 0.000, which means it is less than 0.05, so discipline has an effect on customer satisfaction and H02 is rejected.

3.7 Simultaneous Test Results (F Test)

In Novian et al. (2023), the basis for decision making in a joint test (f-test) is if the sig value (significance) < 0.05 then the independent or free variables simultaneously influence the dependent or dependent variables, whereas if the sig value (significance) > 0.05 then the independent or free variables simultaneously do not influence the dependent or free variables.

Table 7. Simultaneous Test Results (F Test)

Model		Sum of Squares	df	Mean Square	F	Sig.
1	Regression	821,629	2	410,815	58,211	.000b
	Residual	656,329	93	7,057		
	Total	1477.958	95			

The provisions in the simultaneous test (F test) are as follows: If the significance value < 0.05 then the hypothesis is accepted. If the significance value > 0.05 then the hypothesis is rejected. Based on Table 7, the significance value is 0.000<0.05 so it can be concluded that communication and discipline simultaneously have an influence on employee performance.

The results of data processing, obtained results, namely based on the validity test, for the variables of communication and discipline on employee performance, all statements are accepted/valid. Based on the results of the reliability test, the reliability coefficient of the instrument (cronbachalfa) of the communication variable is 0.711, the reliability coefficient of the instrument (cronbachalfa) of service quality is 0.771, and the reliability coefficient of the instrument (cronbachalfa) of customer satisfaction is 0.628. The value of the reliability coefficient of the instrument (cronbachalfa) of all variables is greater than 0.600, this proves that the questionnaire used is reliable or can be relied on. Based on the normality test used, it shows that the Kolmogorov Smirnov value for communication and discipline on employee performance is 0.200, which means that the data is normally distributed (greater than 0.05). Based on the multicollinearity test, this study shows that the VIF value is less than 10 and/or the tolerance value is more than 0.01, so it can suggest that the processed data regression model does not have multicollinearity problems.

The results of the heteroscedasticity test show that there is no heteroscedasticity problem because the significance value of each independent variable is greater than 0.05. Based on

the correlation coefficient test conducted, it shows that the correlation coefficient value between communication and discipline on employee performance is 0.746, which means that communication and discipline on employee performance have a strong correlation relationship. The results of the determination coefficient test value are 56.304%, which means that communication and discipline towards employee performance, product quality and service quality have an influence of 56.304% on employee performance. The results of the multiple linear regression test produced a regression model equation Y = 7.607 + 0.347 (X1) + 0.447 (X2), which means that every increase of 1 unit of communication can increase discipline by 0.347 times and an increase of 1 unit of communication will increase employee performance by 0.510 times. The partial test results (T test) show that the significance value of communication and discipline is less than 0.05, so it can be concluded that Ha1 and Ha2 are accepted. Likewise, the results of the simultaneous test (F test) are accepted. Likewise, the results of the simultaneous test (F test) show that communication and discipline have an influence on customer satisfaction simultaneously.

4. Conclusion

Based on the data analysis and discussion presented in the previous chapter, researchers can draw several conclusions. Employee discipline positively influences performance in achieving company goals at PT. Cipta Mandiri Agung Jaya, Maha Vihara Maitreya, Medan. This is supported by a strong positive correlation between discipline and employee performance, with a correlation coefficient of 0.746. Furthermore, the coefficient of determination indicates that discipline accounts for 97.4% of the variation in employee performance, while the remaining 2.6% is influenced by other factors not examined in this study.

Abstract

The purpose of this research is to find out whether there is an influence of product quality and service quality on purchasing decisions at the Brade Sprayer Shop. The research method is quantitative, with data collected via questionnaires and a Likert scale. The sample in this study was 30 respondents. Sampling uses an incidental technique, which is a sample determination based on chance. Data analysis uses simple regression tests and correlation coefficients and uses SPSS 25 for data processing. The research results show that there is a significant influence between product quality and service quality on purchasing decisions at the Brade Sprayer Shop
Keywords: Product quality; Service quality; Purchasing decisions.

1. Introduction

The development of agriculture in the 24th year has grown very rapidly where vegetables and fruits are so fresh and beautiful, with the quality of sprayer products it has made it easier for farmers to eliminate pests that inhibit the growth and productivity of the plant, Sprayer is a tool or equipment used by farmers in order to eradicate and control pests and plant diseases (Adolph, 2016). This sprayer has undergone various changes, the first is the backpack sprayer model, this model is still relatively manual to use it so that it produces relatively low spray pressure, especially when the operator is tired of moving the backpack sprayer pump lever (Jamaluddin et al., 2014). Until finally the sprayer creates the latest sprayer product quality that greatly helps farmers without having to spray manually, with the portable power sprayer it is very easy to use because this item has used a high-quality GP160 SD1 engine and has extraordinary reliability, so it is suitable for long-term use, besides this machine is very fuel efficient and oil consumption.

Purchasing decisions are decisions to evaluate different products/brands on the market to choose and then buy the product/brand (Citra, 2024) , Meanwhile, according to Tjiptono in Fatkhurrahman (n.d.), purchasing decisions are a division of consumer behavior. Consumer behavior is an action that is directly related to the acquisition and identification of products and services, including the decision-making process before and after the action. Brade Sprayer Store was established in 2018, which is a store that only provides agricultural aids in the form of sprayers with various types and models, namely, Hand Sprayer, Backpack Sprayer, Portable Power Sprayer, Foggers, Tractor Sprayer, Aerial Sprayer, Manual Knapsack Sprayer, Electric Knapsack Sprayer with various models and types can be adjusted to the needs of farmers. Even though the Brade Sprayer Store is quite well-known for the quality of its sprayer products among farmers, there are still some shortcomings in the quality of the

Brade Sprayer Store's products, which makes customers or buyers a little hesitant in planning to purchase the product.

In addition, there are customers who provide suggestions and criticisms about the quality of the product, which often results in failure in the sprayer head, causing it to jam and not be able to be used. The quality of service at the Brade Sprayer store is very good, in terms of communication, very friendly and polite, and the delivery service is on time. This information was obtained by researchers based on interviews conducted in early May.

2. Methodology

2.1 Understanding Purchasing Decisions

According to Indrasari (Artameviah, 2022) Purchasing decisions are a selection of two or more alternative choices, in other words, choices/alternatives must be available to a person when deciding. According to Kerin and Hartley (Erna, 2022), purchasing decision is a five-stage process that buyers go through in making choices about which products and services to purchase including problem recognition, information search, evaluation of alternatives, purchase decision, and post-purchase behavior. According to Firmansyah in Erna (2022) Explains that there are eight purchasing decision indicators as follows: Decision on product type In every decision regarding the purchase of a product, we must pay attention to which important needs come first and the amount of money we have according to our household income.

Decisions on Product Characteristics Consumers decide to buy a mobile phone product with a certain form (size, quality, pattern, etc.). Decisions about brands Consumers decide which brand to take. Companies must understand how consumers choose a brand. The five conditions below drive branding decisions. Products will be easily recognized if they use a brand or brand mark. The product is perceived to have the highest value for its price. Quality and standards are easy to maintain. Demand for general product classes is large enough to support regional, national and international chains. Mass development is critical to the success of the brand to support advertising and administrative overhead costs. There are economies of scale.

According to Sugiyono (Agustian et al., 2019), states that basically a research variable is something in the form of anything that is determined by the researcher to study so that information about it is obtained, then conclusions are drawn. In this study, there are three variables used, namely two independent variables and one closed variable. Researchers use two independent variables (free), namely Product Quality (X1) and Service Quality (X2), and the dependent variable (bound) is Customer Loyalty (Y). In this study using a Likert scale as a measuring tool in a survey. The Likert scale is a technique commonly used in questionnaires to measure respondents' attitudes, opinions, or perceptions of something.

Table 1. Likert Scale Score

Positive Statement	Mark	Negative Statement	Mark
Strongly Disagree (STS)	1	Strongly Disagree (STS)	1
Disagree (TS)	2	Disagree (TS)	2
Hesitant (Neutral)	3	Hesitant (Neutral)	3
Agree (S)	4	Agree (S)	4
Strongly Agree(SS)	5	Strongly Agree (SS)	5

Source: Sugiyono (Wahyuddin 2022)

The author used an associative quantitative research method in this study. The author wanted to understand the relationship between two or more variables using statistics. According to

Sugiyono (Nasution, 2022), an associative strategy is applied to examine the relationship between two variables, namely a causal relationship.

3. Results and Discussion

3.1 Result of Multicollinearity Test

According to Pangow et al. (2024), the multicollinearity test aims to test the correlation between independent variables in regression. A good regression model should be free from such correlation. Multicollinearity can be seen from the Variance Inflation Factor (VIF) and Tolerance values, where VIF < 10.00 and Tolerance > 0.10 indicate the absence of multicollinearity.

Table 2. Multicollinearity Test Results

Model		Collinearity Statistics	
		Tolerance	VIF
1	Quality of Service	.595	1,681
	Product Quality	.595	1,681

The table above shows that the tolerance and VIF values for product quality and service quality meet the tolerance criteria of 0.595>0.10 and VIF 1,681<10.00, so the regression model is free from multicollinearity and is suitable for use.

3.2 Results of Heterocesdasticity Test

According to Widarjono in Nafiudin et al. (2021), the heteroscedasticity test tests whether there is an inequality of residual variance between observations. The decision-making basis for the Heteroscedasticity test is: If the significance > α=0.05, no heteroscedasticity occurs; if < α=0.05, heteroscedasticity occurs. A good regression model should be free from heteroscedasticity.

Table 3. Results of the Heteroscedasticity Test

Model		Unstandardized Coefficients		Standardized Coefficients	t	Sig.
		B	Std. Error	Beta		
1	(Constant)	4.054	2.914		1.391	.168
	Kualitas Pelayanan	.034	.055	.082	.613	.541
	Kualitas Produk	-.066	.058	-.153	-1.144	.255

The table above shows the significance value of product quality 0.168>0.05 and service quality 0.541 > 0.05, so the regression model is free from heteroscedasticity and is suitable for use.

3.3 Results of Correlation Coefficient Test

According to Sugiyono in Marpaung et al. (2021), the correlation coefficient is a strong relationship number between two or more variables. The product-moment correlation coefficient is a correlation technique used to find relationships and prove the hypothesis of a relationship between two variables if the data from the two variables or are the same. In simple terms, correlation can be interpreted as a relationship.

Table 4. Correlation Coefficient Test Results

		Total_X2	Total_X1	Total_Y
Total_X2	Pearson Correlation	1	.700**	.593**
	Sig. (2-tailed)		.000	.001
	N	30	30	30
Total_X1	Pearson Correlation	.700**	1	.602**
	Sig. (2-tailed)	.000		.000
	N	30	30	30
Total_Y	Pearson Correlation	.593**	.602**	1
	Sig. (2-tailed)	.001	.000	
	N	30	30	30

Based on the SPSS "Correlations" output table above, it is known that the Pearson correlation value between the service quality variable (X1) and the purchasing decision (Y) is .001, and the Pearson correlation value between the product quality variable (X2) and the purchasing decision (Y) is 0.000. The two asterisks indicate that there is a strong relationship between the service quality variable (X1) and the purchasing decision (Y) and the product quality variable (X2) and the purchasing decision (Y). A positive correlation value means that if the service quality and product quality increase, the purchasing decision will also increase.

3.4 Result of Coefficient Determination

The coefficient of determination is a value that shows the extent of the contribution of influence given by the independent variable to the dependent variable. According to Ghozali in Ardista (2021), The determination coefficient test (Adjusted R^2) aims to measure the extent to which the calculation is able to explain the variation in the dependent variable.

Table 5. Results of Determination Coefficient Test

Model Summary				
Model	R	R Square	Adjusted R Square	Std. Error of the Estimate
1	.746a	.556	.546	2,657

The formula for testing the coefficient of determination (R2) is as follows.

$$KD = R2 \times 100\%$$
$$KD = (0.746)2 \times 100\%$$
$$KD = 56.304\%$$

From the calculation results above, it can be seen that the magnitude of the influence of Communication (X1) and Discipline (X2) on Employee Performance (Y) is 56.304%.

3.5 Multiple Linear Regression Test Results

According to Qomusuddin and Siti (2021), multiple linear regression analyzes the effect of two or more independent variables (X) on the dependent variable (Y). The following equation describes the multiple linear regression model:

Table 6. Multiple Linear Regression Test

		Unstandardized Coefficients		Standardized Coefficients		
Model		B	Std. Error	Beta	t	Sig.
1	(Constant)	10,282	2,921		3,521	.002
	Total_X2	.271	.166	.335	1,635	.114
	Total_X1	.186	.104	.368	1,793	.084

The regression test results show that Constant (α) = 10,282. This indicates that if product quality (X1) and service quality (X2) = 0, customer loyalty increases by 10,282.
The coefficient X1b1 = 0,271 means that every increase of 1 unit of product quality increases loyalty by 0,271. The service quality coefficient X2b2 = 0,186 means that every increase of 1 unit of service quality increases customer loyalty by 0,186.

3.6 The Results of Hypothesis (F-Test)

Simultaneous Test (F Test) tests whether the independent variables together have a significant effect on the dependent variable (Mardiatmoko, 2020). With the decision: If the sig value is < 0.05 or F count > F table then there is an effect of variable X simultaneously on variable Y. If the sig value is > 0.05 or F count < F table then there is no effect of variable X simultaneously on variable Y

F table = F (k; n-k) F table = F (4; 95)
F table = F (4; 97-2) Where the F table value is 2,47

Table 7. Results of Hypothesis (F-Test)

Model		Sum of Squares	df	Mean Square	F	Sig.
1	Regression	164.082	1	164.082	38.645	.000b
	Residual	118.885	28	4.246		
	Total	282.967	29			

The test results show the significance of the effect of X1 and X2 on Y of 0.000 <0.05 and F count 164.082> 2.47, so that X1 and X2 simultaneously affect Y

3.7 The Results of Hypothesis (T-Test)

According to (Mardiatmoko, 2020) Partial Test (T test) is used to determine whether the independent variable regression model partially has a significant effect on the dependent variable. With the decision: If the sig value <0.05 or t count> t table then there is an influence of variable X on variable Y. If the sig value is> 0.05 or t count < t table then there is no influence of variable X on variable Y.

t table = t (α/2 ; n-k-1) t table = t (0,025 ;94)
t table = t (0,05/2 ; 97-2-1) Where the t table value is 1.986.

Table 8. Results of Hypothesis (T-test)

Model		Unstandardized Coefficients		Standardized Coefficients		
		B	Std. Error	Beta	t	Sig.
1	(Constant)	10.282	2.921		3.521	.002
	Total_X1	.186	.104	.368	1.793	.084
	Total_X2	.271	.166	.335	1.635	.114

The table above shows significant probabilities for X1, X2, and Y (0.000 <0.05), and the t-counts of product quality (X1) (3.521) and service quality (X2) (1.635) exceed the t-table (1.986). So, product quality (X1) and service quality (X2) affect customer loyalty (Y).

4. Conclusion

Based on the results of the research conducted by the author, the author concludes that:The percentage between service quality (X1) and purchasing decision (Y) is 42%. This proves that service quality influences purchasing decision by 42% and the rest is influenced by other factors that are not studied. The percentage between product quality (X2) and purchasing decision (Y) is 38.1%. This proves that customer satisfaction influences customer loyalty by

38.1% and the rest is influenced by other factors that are not studied. The percentage between service quality (X1) and product quality (X2) and purchasing decision (Y) is 49.1%. This proves that service quality and product quality influence purchasing decision by 49.1% and the rest is influenced by other factors that are not studied.

Abstract

This study aims to analyze the influence of service quality and product quality on consumers' purchasing decisions at Tai Wok. In today's increasingly competitive business environment, both service and product quality are considered crucial factors that significantly affect consumer behavior when choosing a product or service. This study targets customers of Tai Wok who have purchased its products and directly experienced the quality of its goods and services.The sampling method used is non-probability sampling with an incidental sampling technique, where respondents were selected based on their availability and willingness to participate by filling out the questionnaire voluntarily. Primary data was collected through the distribution of questionnaires to 50 selected respondents. The data was then analyzed using an F-test (simultaneous test) with the help of SPSS version 26 software to determine the simultaneous effect of service quality and product quality on purchasing decisions. The results of the analysis indicate that service quality and product quality together have a significant influence on consumer purchasing decisions. However, there are also other external factors not examined in this study that may affect consumer choices. This research provides valuable insights for business owners and managers in developing effective marketing strategies, enhancing customer service quality, and improving product offerings to be more competitive in the market and better aligned with customer expectations and needs.
Keywords: Service Quality; Product Quality; Purchase Decision.

1. Introduction

In the modern era, business competition is becoming increasingly intense, particularly in the culinary industry. The culinary business is one of the many businesses that is growing rapidly even during a crisis. This is because food is a fundamental human need that must be fulfilled. The growth of the culinary industry is accompanied by an increasing number of restaurants offering similar foods, with many individuals competing to establish businesses in order to maximize their profits. With the continuous development of technology, it can be observed that while buying and selling transactions were previously conducted directly, people and businesses are increasingly shifting to virtual markets and becoming accustomed to conducting transactions, including sales, purchases, and product marketing, online. The industry, as one of the main sectors of the national economy, plays a strategic role in supporting economic sustainability and growth.

Service quality is the overall features and characteristics of a good or service that influence its ability to satisfy stated or implied needs (Khairani et al., 2019). Service quality is provided by a company to be able to meet the expectations of its consumers. Meanwhile, Fadhilah and Nainggolan (2024) state that service quality is the level of expected excellence and managing that level of excellence to meet customer expectations. Sari and Indra (2024) state that product quality is quality that involves efforts to meet or exceed customer expectations, which includes products, services, people, processes, and the environment. Product quality is also

a constantly changing condition (for example, what is considered high quality today may be worse in the future). Vol and Sandra (2024) state that product quality is known as the capabilities, features, and characteristics of a product or service that depend on its ability to satisfy customer needs. According to Irwan and Wibowo (2021), consumers make purchasing decisions after they identify problems, evaluate, and obtain information about a particular product. Marketers need to have a deeper understanding of the many factors that influence the consumer decision-making process if they are to be successful.

Price, brand image, promotion, and overall product quality are just a few of the factors that influence consumers' views on their purchasing decisions. According to Manoy et al. (2021), purchasing decisions are consumer behavior about how individuals, groups, and organizations select, buy, use goods, services, ideas, or experiences to satisfy their needs and wants. Tai Wok Vegetarian is a culinary business offering Japanese inspired cuisine that combines tradition and innovation in every dish. It provides customization fast food wok dishes, authentic vegetarian ramen, and a dining experience that evokes the atmosphere of Japan. Tai Wok, located near Pasarame at Jl. Asia Baru no. 61, Sei Rengas II, Medan Area District, Medan City, North Sumatra, features a plant-based concept inspired by Taiwanese street food. All menu items are uniquely prepared using a wok with a high-pressure method, which imparts a distinctive smoky aroma to the dishes. Based on this background, the author is interested in conducting a study entitled "The Influence of Service Quality and Product Quality on Purchasing Decisions at Tai Wok Vegetarian Medan."

2. Methodology

This research method is a quantitative method. Research used quantitative methods, namely concrete/empirical, objective, measurable, rational, and systematic. Quantitative methods are also called discovery methods, because with this method it can be discovered and developed as new science and technology with research data in the form of numbers and statistical analysis. According to Sugiyono in Fitria and Barseli (2021), quantitative research is a research method based on the philosophy of positivism. It is used to study a particular population or sample, with sampling techniques typically carried out randomly. Data collection is collected using research instruments, and data analysis is quantitative statistical, with the primary aim of testing the formulated hypothesis. The problem formulation used by the author is associative, which seeks to examine the relationship between two or more variables. This relationship is causal in nature, meaning it involves a cause-and-effect connection. In this study, the independent variables, which influence other variables, are denoted as X_1 and X_2, while the dependent variable, which is influenced, is denoted as Y.

3. Results and Discussion

3.1 Normality Test Results

Normality Test is conducted to determine whether the data taken from a population are normally distributed or not. The normality test in this study uses Kolmogorov-Smirnov. Data are considered normally distributed if the significance value is greater than 0.05. In this study, normality was assessed using the Kolmogorov-Smirnov (KS) nonparametric statistical test. The acceptance criteria are as follows: if the significance value (2-tailed) is ≥ 0.05, the data are considered normally distributed; conversely, if the significance value (2-tailed) is < 0.05, the data are considered not normally distributed (Quaris, 2021).

Table 1. Normality Test Results

One-Sample Kolmogorov-Smirnov Test		
		Unstandardized Residual
N		50
Normal Parametersa,b	Mean	.0000000
	Std. Deviation	1.21673769
Most Extreme Differences	Absolute	.089
	Positive	.046
	Negative	-.089
Test Statistics		.089
Asymp. Sig. (2-tailed)		.200c,d

Based on the results of the normality test, the significance value is 0.200 > 0.05, so it can be concluded that the residual value is normally distributed.

3.2 Linearity Test Results

The significance level is 0.05 and the degrees of freedom of the numerator are n-1 and the degrees of freedom of the denominator are n-1, so if the F count < F table is obtained, it means that the linear data is assisted by using SPSS for Windows Release Version 25 according to Maesarah et al. (2024).

Table 2. Results of Linearity Test of Service Quality

			Sum of Squares	df	Mean Square	F	Sig.
Y * X1	Between Groups	(Combined)	68,525	14	4.895	1,527	.152
		Linearity	34,758	1	34,758	10,843	.002
		Deviation from Linearity	33,766	13	2,597	.810	.646
	Within Groups		112.195	35	3.206		
	Total		180,720	49			

3.3 Heteroscedasticity Test Results

The Heteroscedasticity Test is carried out to determine whether or not the data taken from the population shows symptoms of heteroscedasticity. According to Ghozali in Dona (2023), Heteroscedasticity test is a classical assumption test included in the linear regression model. The purpose of the heteroscedasticity test is to determine whether there is a variance inequality among the residuals in the regression model. If the residuals have equal variance across observations, the data are said to exhibit homoscedasticity; if the variance differs, it is referred to as heteroscedasticity.

Table 3. Heteroscedasticity Test Results

Model		Unstandardized Coefficients B	Unstandardized Coefficients Std. Error	Standardized Coefficients Beta	t	Sig.
1	(Constant)	2.173	1.244		1,747	.087
	X1	-.024	.035	-.103	-.676	.362
	X2	-.010	.019	-.077	-.507	.417

Table 3 showed that the correlation value for the service quality variable is significant, 362> 0.05, and product quality has a significant value.417> 0.05. This indicates that the regression model is free of heteroscedasticity and is suitable for use.

3.4 Multicollinearity Test Results

Multicollinearity tests are carried out to determine whether or not the data taken from the population shows symptoms of multicollinearity. Multicollinearity testing is carried out by looking at the Variance Inflation Factor (VIF) value between independent variables with the tolerance value. The commonly used limits to indicate the presence of multicollinearity are tolerance values < 0.10 and VIF values > 10, while if the tolerance value > 0.10 and VIF value < 10 then it is stated that there is no multicollinearity (Mardiatillah et al., 2021).

Table 4. Multicollinearity Test Results

Model		Unstandardized Coefficients		Standardized Coefficients			Collinearity Statistics	
		B	Std. Error	Beta	t	Sig.	Tolerance	VIF
1	(Constant)	17,994	1,916		9,393	.000		
	X1	.123	.054	.221	2.266	.028	.896	1.116
	X2	.207	.030	.673	6,897	.000	.896	1.116

Table 4 shows that there are no symptoms of multicollinearity, because each independent variable (service quality and product quality) has a VIF < 10 and a tolerance > 0.1.

3.5 Correlation Coefficient Test Results

According to Riadi in Ardista (2021), the Pearson product moment correlation is a parametric statistical test tool used to examine the relationship between two random, homogeneous, and normally distributed samples. In simple terms, correlation can be understood as a measure of the relationship between variables.

Table 5. Correlation Coefficient Test Results

		X1	X2	Y
X1	Pearson Correlation	1	.323*	.439**
	Sig. (2-tailed)		.022	.001
	N	50	50	50
X2	Pearson Correlation	.323*	1	.745**
	Sig. (2-tailed)	.022		.000
	N	50	50	50
Y	Pearson Correlation	.439**	.745**	1
	Sig. (2-tailed)	.001	.000	
	N	50	50	50

Based on the SPSS "Correlations" output table, it is known that the Pearson correlation value between the service quality variable (X1) and the purchasing decision (Y) is .001, and the Pearson correlation value between the product quality variable (X2) and the purchasing decision (Y) is 0.000. The two asterisks indicate that there is a strong relationship between the service quality variable (X1) and the purchasing decision (Y) and the product quality variable (X2) and the purchasing decision (Y). A positive correlation value means that if the service quality and product quality increase, the purchasing decision will also increase.

3.6 Results of Determination Coefficient Test

The coefficient of determination is a value that shows the extent of the contribution of influence given by the independent variable to the dependent variable. According to Ghozali in Ardista (2021), The determination coefficient test (Adjusted R^2) aims to measure the extent to which the calculation is able to explain the variation in the dependent variable.

Table 6. Results of the Determination Coefficient Test

Model Summary				
Model	R	R Square	Adjusted R Square	Std. Error of the Estimate
1	.774a	.599	.582	1.242

Based on the table above, the R Square value is 0.038, demonstrating that the partial influence of the service quality variable (X1) and product quality (X2) on the purchasing decision variable (Y) is 59% at Tai Wok Vegetarian Medan.

3.7 Multiple Linear Regression Test Results

Multiple linear regression is used to find the influence of two or more independent variables (X) on the dependent variable (Y). Multiple linear regression analysis is a linear relationship between two or more independent variables (X) on the dependent variable (Y).$X1$,$X2$,...Xp) with its dependent variable (Y). Usually the data used is on an interval or ratio scale (Maharadja et al., 2021).

Table 7. Multiple Linear Test Results

Model		Unstandardized Coefficients		Standardized Coefficients		
		B	Std. Error	Beta	t	Sig.
1	(Constant)	17,994	1,916		9,393	.000
	X1	.123	.054	.221	2.266	.028
	X2	.207	.030	.673	6,897	.000

Based on the table above, the multiple linear regression equation can be derived from the B values in the Unstandardized Coefficients section using the following formula:

Purchase decision = 17,994 + 0.123 service quality + 0.207 product quality

Based on the equation above, the interpretations are as follows:

a) The constant (α) = 17.994 shows the constant value, if the value of the independent variable X1, namely service quality and the value of variable X2, namely product quality, is 0, then the purchasing decision will increase by 17.994.
b) The coefficient X1b1 = 0.123 shows that the service quality variable (X1) has a positive effect on purchasing decisions by 0.123. This means that for every 1 unit increase in service quality (X1), the service quality on purchasing decisions will increase by 0.123.
c) The coefficient X2b2 = 0.207 shows that the product quality variable (X2) has a positive effect on purchasing decisions by 0.207. This means that for every 1 unit increase in product quality (X2), the product quality on purchasing decisions will increase by 0.207.

From the analysis conducted, the following research results were obtained:

a) Based on the results of the normality test, the significance value is 0.200 > 0.05, so it can be concluded that the residual value is normally distributed.
b) The results of the multicollinearity test shown that the correlation value for the service quality tolerance value variable is 1,000 > 0.10 and the service quality VIF value is 1,000 < 10.00, product quality has a tolerance value of 1,000 > 0.10 and the product quality VIF value is 1,000 < 10.00, indicating that this regression model is free from multicollinearity symptoms and is suitable to be used.
c) The results of the heteroscedasticity test showed that the correlation value for the significant value variable of service quality is 0..362> 0.05 and product quality has

a significant value of 0.471 > 0.05. Thus, this regression model is free from heteroscedasticity symptoms and is suitable to be used.

d) The results of the correlation coefficient test demonstrate that the variables of service quality (X1), product quality (X2), and purchasing decisions (Y) are related because the values show positive results. The correlation value (r) is 0.795 which means that service quality and product quality have a strong relationship to purchasing decisions.
e) The results of the determination coefficient test showed that the R Square value is 0.038, which means that the partial influence of the service quality variable (X1) on the purchasing decision variable (Y) is 3.8% at Tai Wok Vegetarian Medan.
f) The results of the determination coefficient test showed that the R Square value is 0.599, which means that the influence of the product quality variable (X2) simultaneously on the purchasing decision variable (Y) is 59% at Tai Wok Vegetarian Medan.
g) The results of the determination coefficient test show that the R Square value is 0.633, which means that the influence of the service quality variables (X1) and product quality (X2) simultaneously on the purchasing decision variable (Y) is 59% at Tai Wok Vegetarian Medan.
h) The results of the t-test show that the significant probability figure for the service quality variable (X1) is 0.005 < 0.05 and the product quality variable (X2) is 0.000 < 0.05, the calculated t value for the service quality variable (X1) is 2.226 > 1.98552 t table, the calculated t value for the product quality variable (X2) is 6.897 > 1.98552 t table so it can be concluded that there is an influence between variable X1 on variable Y and X2 has an influence on variable Y.
i) The results of the F test show that the significance value for the influence of X1 and

4. Conclusion

Based on the results of this study, it can be concluded that service quality has a positive and significant effect on purchasing decisions at Tai Wok Vegetarian Medan. This suggests that an improvement in service quality is likely to lead to an increase in purchasing decisions. Similarly, product quality also has a positive and significant influence on purchasing decisions at Tai Wok Vegetarian. This indicates that improving product quality is likely to result in higher purchasing decisions. Furthermore, service quality and product quality together have a simultaneous influence on purchasing decisions at Tai Wok Vegetarian Medan. The study found that the percentage of influence between service quality and product quality on purchasing decisions is 59%. This means that these two variables account for 59% of the variation in purchasing decisions, while other unexamined factors influence the remaining portion.

Abstract

The purpose of this study is to examine and analyze the influence of Service Quality and Customer Trust on Customer Loyalty among Shopee Users in Medan City. This study employs a quantitative research method. The population of this study is unknown, so the author uses the Lemeshow formula to determine the sample size, which is 97 samples. The partial test results on Service Quality (X1) show that the t-count value (2.751) > t-table value (1.985) with a significance level of 0.007 < 0.05, Therefore, it can be concluded that there is a significant positive partial effect of Service Quality on Customer Loyalty on Shopee in Medan City. Meanwhile, for Customer Trust (X2), it shows the t-count value (3.717) > t-table (1.985) with a significant level of 0.000 < 0.05. Therefore, it can be concluded that there is a significant positive partial effect between Customer Trust and Customer Loyalty on Shopee in Medan City. The simultaneous test results show the F-count value (12.328) > F-table value (3.09) with a significance level of 0.000 < 0.05. Therefore, it can be concluded that there is a significant effect between Service Quality and Customer Trust simultaneously on Customer Loyalty.

Keywords: Service quality; Customer trust; Customer loyalty.

1. Introduction

Changes and developments in the field of technology have a significant impact on various sectors that follow the global economy, from an industrial economy to a service economy. One of the technological developments is online sales applications, which are currently popular, such as Shopee. With the increasing development of technology, the need for online stores has also increased.

A company will succeed if it is oriented towards consumer desires, aiming to satisfy consumers. Companies that want to grow and gain a competitive advantage must provide quality products or services and good customer service, which will lead to customer loyalty. Loyal customers will provide many benefits to the company, such as repeat purchases and recommendations to friends.

Service quality is a crucial factor that companies must consider to gain customer loyalty. Service quality is the key to a company's success, especially in the retail sector. The quality of service depends on the producer's ability to meet consumer expectations consistently. Satisfied consumers will create loyalty, drive word-of-mouth recommendations, and even improve the company's image in the eyes of consumers. Therefore, service quality must be the company's primary focus.

Customer trust is also an essential factor that companies must consider to gain customer loyalty. Usually, good experiences and information will build consumer trust in a product or service, because the experience formed in the consumer's memory can create a sense of trust if the experience is enjoyable and satisfying.

Currently, the use of the Shopee application in Medan city is very widespread, almost everyone uses the Shopee application. However, there are problems with the Shopee

application, where every Shopee user, whether a buyer or seller, experiences problems within Shopee and contacts Shopee's customer service, they will receive very slow responses and a lengthy problem-solving process. Additionally, there are frequent issues with lost items during the use of certain courier services, which makes consumers feel distrustful. This leads to consumer disappointment, resulting in decreased customer loyalty.

1.1 Theoretical Framework

Service quality can be defined as focusing on meeting needs and requirements, as well as timeliness in meeting customer expectations (Chandra et al., 2020). Service quality is a central point for companies because it affects customer satisfaction, and customer satisfaction will emerge if the quality of service provided is good (Nurdin, 2019). Based on these definitions, it can be concluded that service quality is a crucial factor in meeting customer needs and expectations, which can have a positive impact on the company. The indicators of service quality according to Kotler & Keller are (Kotler, 2019):

i. Reliability
ii. Responsiveness
iii. Assurance
iv. Empathy
v. Tangible

Customer trust is another essential factor companies must consider to gain customer loyalty. Positive experiences and information build consumer trust. However, in Medan City, Shopee users often face problems like slow customer service responses and lost items, which can lead to distrust, disappointment, and decreased customer loyalty. Trust is the foundation of business. A business transaction between two or more parties will occur if each party trusts the other (Syah, 2021). Trust is the foundation of a relationship, and a relationship between two or more parties will occur if each party trusts the other (Rifa'i, 2019). Trust is a descriptive idea that someone has about something (Rahayu & Afrilliana, 2021). Trust is defined as a dimension of business relationships that determines the extent to which people feel they can rely on the integrity of promises offered by others (Haryanto, 2020). Based on these definitions, it can be concluded that trust is a crucial factor in business relationships, where parties must trust each other and rely on the integrity of promises made. The indicators of customer trust according to (Rifa'i, 2019):

i. Ability
ii. Benevolence
iii. Integrity

Customer loyalty is a deep commitment to repurchase or re-transact a product or service consistently in the future, despite situational influences and marketing efforts that may change behavior (Hermanto, 2019). Customer loyalty is demonstrated by regular purchases or a condition where customers are required to make at least two purchases within a certain time frame (Manihuruk, 2023). Based on these definitions, it can be concluded that customer loyalty is a condition where customers commit to repurchasing products or services consistently in the future. The indicators of customer loyalty according to Hermanto are (Hermanto, 2019):

i. Makes regular repeat purchases
ii. Purchases across product and service lines
iii. Refers other
iv. Demonstrates an immunity to the pull of the competition

Customer loyalty, characterized by repeat purchases and customer trust in the products consumed, as well as customers' willingness to recommend the business to their acquaintances, indicates that customers are loyal to the business. However, the quality of service provided must also be maintained and continuously improved to build customer trust (Kristanto, 2022). Customer trust can increase customer loyalty by way of one party's

willingness to accept risk from the actions of another party based on the expectation that the other party will take important actions to benefit the trusting party, and control the actions of the trusted party (Aini, 2020). The conceptual framework of this study is illustrated in the diagram below.

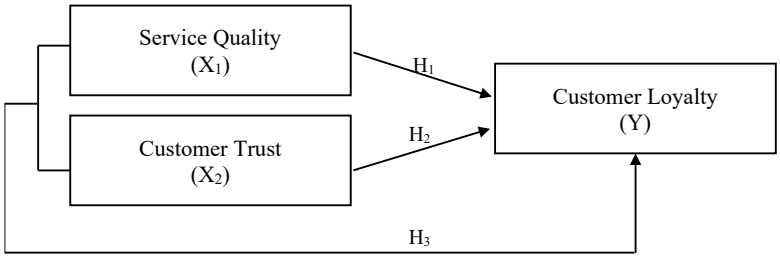

Fig. 1. Conceptual Framework

Based on this framework, the following hypotheses are formulated:
H1: It is suspected that there is an influence of Service Quality on Customer Loyalty of Shopee users in Medan City.
H2: It is suspected that there is an influence of Customer Trust on Customer Loyalty of Shopee users in Medan City.
H3: It is suspected that there is an influence of Service Quality and Customer Trust on Customer Loyalty of Shopee users in Medan City.

2. Methodology

This research employs a quantitative method. Quantitative research methods are based on positivist philosophy and are used to study specific populations or samples. Data collection utilizes research instruments, and data analysis is quantitative/statistical, aiming to test established hypotheses. This study uses the Statistical Program for Social Science (SPSS) version 27 (Sahir, 2021). The researcher spent 3 months conducting this study, which included proposal development and ongoing guidance until the final thesis was completed.
The population in this study consists of all Shopee marketplace consumers in Medan City, North Sumatra, where the exact population size is unknown. "A sample is a part of a population that possesses certain characteristics used for research" (Ghozali, 2021). The sampling technique used is non-probability sampling, specifically accidental sampling. Accidental sampling involves selecting respondents as samples based on chance encounters, where anyone who happens to meet the researcher can be used as a sample if they fit the criteria as a data source (Sugiyono, 2019). Given the unknown population size, the sample size in this study is determined using the Lemeshow formula, which is suitable for cases where the population size is unknown or infinite. The Lemeshow formula is as follows:

$$n = \frac{Z^2(1-P)}{d^2} \quad (1)$$

Where:
n = sample size
Z = Z-score at 95% confidence level = 1,96
P = maximum estimate = 0,5
d = alpha (0,10) or sampling error = 10%

Using the above formula, the sample size calculation is as follows:

$$n = \frac{1{,}96^2 . 0{,}5\ (1 - 0{,}5)}{0{,}1^2} = 96{,}04 = 97\ respondents$$

In this study, the minimum sample size required is 96.04, which is rounded up to 97 respondents. To collect relevant data for this study, a questionnaire-assisted interview will be conducted. The data collection technique will be carried out through a questionnaire, which will be measured using a Likert scale of 1-5. The Likert scale itself has answers in the form of positive statements, with 5 response options weighted as follows:

i. Strongly Disagree (score 1).
i. Disagree (score 2).
ii. Neutral (score 3).
iii. Agree (score 4).
iv. Strongly Agree (score 5).

3. Results and Discussion

3.1 Reliability Test

A questionnaire is considered reliable if the Cronbach's Alpha value is greater than 0.6.

Table 1. Reliability Test

Variable	Cronbach's Alpha	N of Items
Service Quality	0,803	10
Customer Trust	0,706	8
Customer Loyalty	0,727	8

Based on the table above, both the independent and dependent variables have Cronbach's Alpha values above 0.6, indicating acceptable reliability.

3.2 Classical Assumption Test

The normality test of residuals is used to determine whether the residuals resulting from the regression are normally distributed or not. The results of the normality test are as follows:

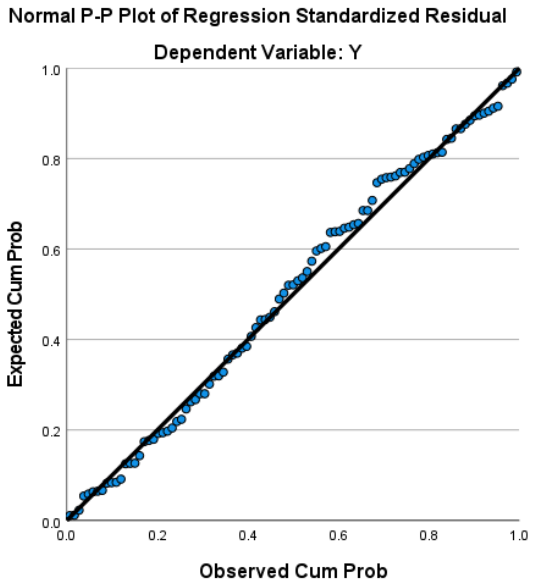

Fig. 2. *Normal P-Plot*

From Figure 2 above, the points are close to the diagonal line, indicating that the data are normally distributed and meet the normality assumption.

Table 2. One-Sample Kolmogorov-Smirnov Test

		Unstandardized Residual
N		97
Normal Parameters[a,b]	Mean	30.6597938
	Std. Deviation	1.99337739
Most Extreme Differences	Absolute	.074
	Positive	.051
	Negative	-.074
Kolmogorov-Smirnov Z		.074
Asymp. Sig. (2-tailed)		.200[a]

Furthermore, based on Table 2 above, the Kolmogorov-Smirnov normality test results show that the significance level is greater than 0.05, specifically 0.200. Therefore, it can be concluded that the normality test results indicate a normal distribution.

3.3 Multicollinearity Test

Based on Table 3 below, it can be observed that the correlation values for the variables Service Quality and Customer Trust have a tolerance value (0.981) greater than 0.1 and a VIF value (1.019) less than 10.

Table 3. Multicollinearity Test Results

Model		Collinearity Statistics	
		Tolerance	VIF
1	(Constant)		
	Service Quality	.981	1.019
	Customer Trust	.981	1.019

Therefore, it can be concluded that there is no multicollinearity issue between the variables Service Quality and Customer Trust.

3.4 Heteroscedasticity Test

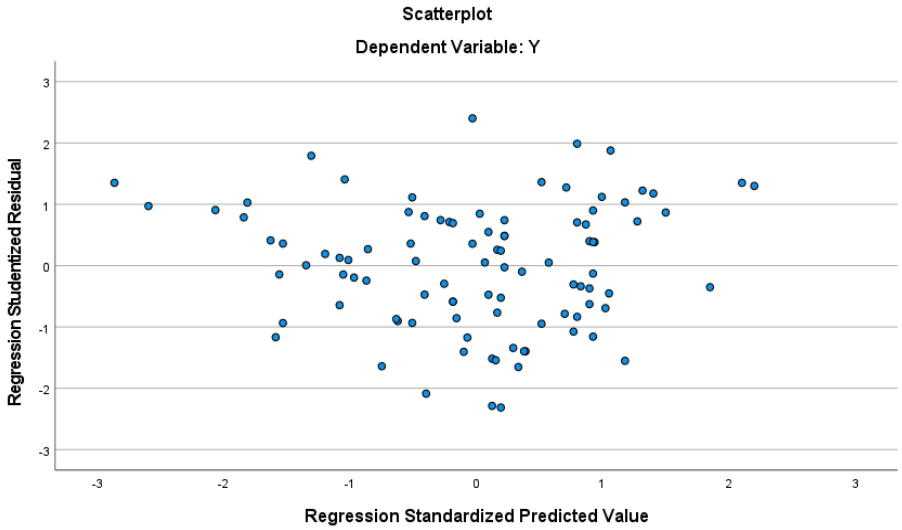

Fig. 3. Scatterplot Graph

From Figure 3 above, it can be seen that the points in the scatterplot are randomly distributed above and below the 0 value on the Y-axis, without forming any specific pattern. This suggests that heteroscedasticity is not present in the data.

3.4 Multiple Linear Regression Analysis

Table 4. Multiple Linear Regression Analysis Results

Model		Unstandardized Coefficients		Standardized Coefficients
		B	Std. Error	Beta
1	(Constant)	9.288	4.498	
	Service Quality	0.252	0.092	0.255
	Customer Trust	0.447	0.120	0.344

Based on Table 4 above, the multiple linear regression equation is formulated as follows:

$$\text{Customer Loyalty} = 9.288 + 0.252\ \text{Service Quality} + 0.447\ \text{Customer Trust} + e$$

The equation can be interpreted as follows: The constant (α) is 9.288, which indicates that if the independent variables Service Quality and Customer Trust are zero, Customer Loyalty will remain constant at 9.288. The coefficient for Service Quality is 0.252, which shows that Service Quality (X1) has a positive effect on Customer Loyalty. This means that for every one-unit increase in Service Quality, Customer Loyalty will increase by 0.252. Finally, the coefficient for Customer Trust is 0.447, indicating that Customer Trust (X2) also has a positive effect on Customer Loyalty. This means that for every one-unit increase in Customer Trust, Customer Loyalty will increase by 0.447.

3.5 Coefficient of Determination Test (R^2)

The results of the coefficient of determination test are presented in the table:

Table 5. Coefficient of Determination Test

Model Summary[b]

Model	R	R Square	Adjusted R Square	Std. Error of the Estimate
1	.456[a]	0.208	0.191	3.933

Based on Table 5, the R Square (R^2) value or coefficient of determination is 0.208, indicating that 20.8% of the variation in Customer Loyalty can be explained by the variables Service Quality and Customer Trust. The remaining 79.2% is influenced by other factors outside of this research model, such as consumer behaviour and product quality. Based on the partial hypothesis testing results, Service Quality (X1) has a significant positive effect on Customer Loyalty for Shopee users in Medan City. The t-count value for Service Quality was 2.751, which is greater than the t-table value of 1.985, and its significance level was 0.007, which is less than 0.05. Similarly, the partial hypothesis testing results for Customer Trust (X2) show a significant positive effect on Customer Loyalty for Shopee users in Medan City. The t-count value was 3.717, exceeding the t-table value of 1.985, and the significance level was 0.000, which is less than 0.05. Furthermore, the simultaneous hypothesis testing using the F-test indicates that both Service Quality and Customer Trust have a significant simultaneous effect on Customer Loyalty. The F-count value was 12.328, which is greater than the F-table value of 3.09, with a significance level of 0.000.

4. Conclusion

The partial test results indicate that Service Quality has a positive and significant influence on Customer Loyalty among Shopee users in Medan City. The partial test results also show that Customer Trust has a positive and significant influence on Customer Loyalty on Shopee in Medan City. Furthermore, the simultaneous test results confirm that Service Quality and Customer Trust together have a positive and significant influence on Customer Loyalty on

Shopee in Medan City. For future research, it's recommended to explore other variables that could influence customer loyalty, such as brand image and customer satisfaction. This would provide a more comprehensive understanding of the factors that drive customer loyalty.This study was limited to a sample of 97 respondents due to constraints in time, effort, and cost. Therefore, future research should aim to increase the number of respondents to better represent the actual situation. This can enhance the generalizability and reliability of the findings.

Abstract

This study aims to analyze the influence of service quality on customer satisfaction in family poultry farming. A quantitative explanatory approach was used, with a survey of 96 poultry farm customers, employing purposive sampling. Data were collected through structured questionnaires based on the SERVQUAL dimensions, then analyzed using descriptive statistics, correlation tests, and simple linear regression. The results showed that service quality had a significant positive effect on customer satisfaction, with a correlation coefficient of 0.775 and a coefficient of determination (R^2) of 0.600. This indicates that 60% of the variation in customer satisfaction is explained by service quality. Regression analysis confirmed a positive influence with a coefficient of 0.593 ($p < 0.000$). These findings support previous studies and reinforce the importance of service-oriented practices such as responsiveness, empathy, and reliability to strengthen satisfaction and loyalty in poultry businesses. The results also highlight that other factors may influence customer satisfaction beyond service quality, which can be explored in future studies. This study contributes to service quality research in the agribusiness context and provides practical insights for poultry farm managers to improve service delivery and build stronger customer relationships.
Keywords: Service quality; Customer satisfaction; Poultry farming.

1. Introduction

The livestock sector, particularly poultry farming, plays a vital role in meeting global food security demands. As consumer demand for chicken products rises, poultry farms must not only focus on product quality but also prioritize delivering excellent service quality to satisfy increasingly demanding customers. Customer satisfaction is an essential aspect for business sustainability (Widodo et al., 2023) and is a feeling that buyers experience when a company's performance meets their expectations (Hadi & Indradewa, 2019). Service quality has been identified as a key determinant of customer satisfaction across various service-based industries (Parasuraman et al., 1988). The SERVQUAL model identifies five dimensions of service quality that influence customer satisfaction: tangibles, reliability, responsiveness, assurance, and empathy (Parasuraman et al., 1988). However, its significance in agribusiness settings like poultry farming has received limited empirical attention (Gronroos, 1984). In the poultry sector, customers frequently interact with farm staff regarding product inquiries, health guarantees, supply reliability, and after-sales support (Rao et al., 2025). Poor service quality in these interactions may negatively affect customer satisfaction, loyalty, and business sustainability (Rao et al., 2025).

This study aims to examine the influence of service quality on customer satisfaction among poultry farm consumers, thereby providing empirical evidence and practical insights for service quality improvements in the livestock sector (Widodo et al., 2023). Several previous studies have shown that service quality affects customer satisfaction, such as the research conducted by Rokmah and Mulyani (2023), Firmawati (2022), and Ramadhan et al. (2019) . However, other research by Dzulfikri and Kusworo (2025) and Syariful and Untung (2020) showed that service quality does not affect customer satisfaction. This is particularly relevant as competition increases and customer expectations rise in agricultural markets. This research seeks to fill that gap by empirically examining the influence of service quality on customer satisfaction among poultry farm consumers. The findings are expected to provide both theoretical contributions to service quality literature in agribusiness and practical insights for poultry farm managers aiming to improve customer-oriented strategies. The research framework is shown in Fig. 1.

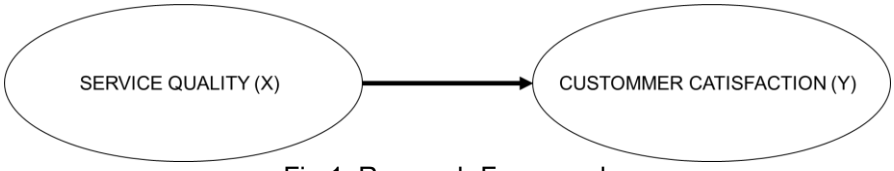

Fig.1. Research Framework

Despite this growing evidence, there is still limited empirical investigation into how service quality impacts customer satisfaction, specifically in the context of poultry farming in developing countries. Most prior studies have focused on industrial or retail service sectors, leaving a research gap in understanding how farm-level service delivery influences satisfaction among poultry farm customers. This is particularly relevant as competition increases and customer expectations rise in agricultural markets. Therefore, this research seeks to fill that gap by empirically examining the influence of service quality on customer satisfaction among poultry farm consumers. The findings are expected to provide both theoretical contributions to service quality literature in agribusiness and practical insights for poultry farm managers aiming to improve customer-oriented strategies.

2. Methodology

This research employed a quantitative approach with an explanatory design to analyze the influence of service quality on customer satisfaction in poultry farming. The study used a survey method by distributing structured questionnaires to poultry farm customers. The population consisted of poultry farm consumers in the research area. Using purposive sampling, 96 respondents were selected based on their experience as regular customers of the poultry farm. A structured questionnaire was developed based on the servqual framework by Parasuraman et al. (1988) , measuring five dimensions of service quality: tangibles, reliability, responsiveness, assurance, and empathy. Customer satisfaction was measured using adapted indicators from previous customer satisfaction research (Nugroho et al., 2021). Responses were recorded on a five-point Likert scale ranging from “strongly disagree” to “strongly agree”. Data analysis was carried out using descriptive statistics, correlation tests, coefficient of determination (R2), and simple linear regression to examine the relationship between service quality and customer satisfaction. Data normality was tested using the Kolmogorov-Smirnov method, and linearity was evaluated through ANOVA. Statistical analysis was performed using SPSS software.

3. Results and Discussion

The normality test result, according to Ghozali (2021), aims to determine the distribution of data within the variables employed in the study. Based on the results of the Kolmogorov-Smirnov normality test, the Asymp. Sig. (2-tailed) value was 0.200, which is greater than 0.05.

This indicates that the data residuals are normally distributed, allowing for the use of parametric statistical analysis. The linearity test showed a significant linear relationship between service quality and customer satisfaction (Vivi, 2019). The deviation from linearity was not significant (Sig. = 0.265), confirming that a linear model can adequately describe the relationship.

Table 1. Normality Test Result

		Unstandardized Residual
N		96
Normal Parameters[a,b]	Mean	.0000000
	Std. Deviation	2.57684055
Most Extreme Differences	Absolute	.055
	Positive	.055
	Negative	-.055
Test Statistic		.055
Asymp. Sig. (2-tailed)		.200[c,d]

This indicates that the data residuals are normally distributed, allowing for the use of parametric statistical analysis. With p > 0.05, the data met the normality assumption, thus supporting the validity of further parametric statistical tests used in the analysis.

3.1 Linearity Test Result

The linearity test is frequently employed as a prerequisite for conducting correlation or linear regression analyses. The criterion for the decision-making process in the linearity test stipulates that if two variables demonstrate a significant value (sig. Deviation from linearity) greater than 0.1, it can be concluded that both variables are linear.

Table 2. Linearity Test Result

				Sum of Squares	df	Mean Square	F	Sig.
Kepuasan Konsumen * Kualitas Pelayanan	Between Groups	(Combined)		1118.758	23	48.642	7.610	.000
		Linearity		948.148	1	948.148	148.341	.000
		Deviation from Linearity		170.609	22	7.755	1.213	.197
	Within Groups			460.201	72	6.392		
	Total			1578.958	95			

The linearity test showed a significant linear relationship between service quality and customer satisfaction, with an F-value of 148.341 and a significance of 0.000 on the linearity component. The deviation from linearity was not significant (Sig. = 0.265), confirming that a linear model can adequately describe the relationship between the two variables.

3.2 Correlation Test Result

The correlation coefficient (R) indicates the strength or weakness of the relationship between two variables. This study adopts Product-Moment correlation analysis.

Table 3. Correlation Test Result

		Gamification	Student Learning Motivation
Kualitas Pelayanan	Pearson Correlation	1	.775**
	Sig. (2-tailed)		.000
Kepuasan Konsumen	Pearson Correlation	.775**	1
	Sig. (2-tailed)	.000	

The findings of this research emphasize the critical role of service quality in influencing customer satisfaction within poultry farming enterprises. The significant positive correlation ($r = 0.775$, $p<0.01$) is consistent with the well-established SERVQUAL theory developed by Parasuraman et al. (1988). The coefficient of determination ($R2=0.600$) demonstrates that service quality alone accounts for a substantial proportion (60%) of the variation in customer satisfaction. The positive and significant regression coefficient also aligns with the results of Ramadhan et al. (2019). These findings have practical implications: poultry farms that emphasize employee training, consistent service delivery, and customer-focused processes will more likely secure customer loyalty (Kotler & Keller, 2019).

3.3 Coefficient of Determination Test Result

Table 4. Coefficient of Determination Test Result

Model	R	R Square	Adjusted R Square	Std. Error of the Estimate
1	.775[a]	.600	.596	2.591

While service quality accounts for a large portion of customer satisfaction, the remaining 40% suggests the potential impact of other elements, such as product quality, price competitiveness, and farm accessibility. This aligns with the framework proposed by Gronroos (1984), who argued that perceived quality comprises technical quality, functional quality, and image.

3.4 Simple Linear Regresion

Table 5. Simple Linear Regresion

Model		Unstandardized Coefficients		Standardized Coefficients	t	Sig.
		B	Std. Error	Beta		
1	(Constant)	.211	1.913		.110	.913
	Kualitas Pelayanan	.593	.050	.775	11.886	.000

The results of the simple linear regression analysis showed that service quality has a positive and significant effect on customer satisfaction, with a regression coefficient of 0.593. The regression equation was Customer Satisfaction = 0.211 + 0.593 × Service Quality. The t-test results confirmed that Service Quality had a statistically significant effect on customer satisfaction, as the p-value was below 0.05; thus, the null hypothesis was rejected (Ghozali, 2021).

3.5 Hypothesis Test Result (t-test)

The findings of this research emphasize the critical role of service quality in influencing customer satisfaction within poultry farming enterprises. The significant positive correlation ($r=0.775$, $p<0.01$) suggests that customers perceive better quality of service as directly enhancing their satisfaction. This is consistent with the well-established SERVQUAL theory developed by Parasuraman et al. (1988), which identifies five key dimensions of service quality—tangibles, reliability, responsiveness, assurance, and empathy—as determinants of customer perceptions and satisfaction. Furthermore, the coefficient of determination ($R2=0.600$) demonstrates that service quality alone accounts for a substantial proportion (60%) of the variation in customer satisfaction. This supports earlier findings in the agribusiness sector, for instance, a study by Anno (2025) on poultry production and marketing strategies.

The positive and significant regression coefficient ($\beta=0.593$, $p<0.000$) also aligns with the results of Ramadhan et al. (2019), who found that service quality has a significant influence on customer satisfaction in broiler chicken companies. This is in line with the view that service

quality is among the most powerful predictors of customer satisfaction in any service-based or product-augmented business. In poultry farming specifically, farmers who invest in more transparent communication, faster response times, and problem-solving capabilities can build higher satisfaction and trust. These findings have practical implications: poultry farms that emphasize employee training, consistent service delivery, and customer-focused processes are more likely to secure customer loyalty. While service quality accounts for a large portion of customer satisfaction, the remaining 40% suggests the potential impact of other elements, such as product quality, price competitiveness, and farm accessibility. This is in line with the framework proposed by Gronroos (1984), who argued that perceived quality is a combination of technical quality, functional quality, and image. Future research can explore these additional factors to develop a more holistic and integrated model of customer satisfaction within poultry farming, strengthening the competitive advantage of livestock agribusiness in an increasingly demanding market.

4. Conclusion

This study empirically demonstrates that service quality has a significant and positive influence on customer satisfaction among poultry farm consumers. The correlation coefficient of 0.775 indicates a strong relationship, while the regression analysis confirms that improvements in service quality meaningfully enhance customer satisfaction. The coefficient of determination shows that service quality accounts for 60% of the variation in customer satisfaction, confirming its critical role in shaping positive customer perceptions. These findings highlight the importance of consistently delivering high-quality services to meet and exceed customer expectations in the poultry farming sector. The results of this research provide valuable insights for poultry farm managers, practitioners, and policymakers. By prioritizing investments in improving service quality —employee responsiveness, communication, reliability, and empathy —poultry farms can substantially increase customer satisfaction and foster stronger loyalty.

Furthermore, the high explanatory power of service quality in predicting customer satisfaction underscores the need for continuous monitoring and evaluation of service quality as part of a strategic customer relationship management plan. Training programs to develop service-oriented skills among farm workers, along with the implementation of standard operating procedures that ensure consistent service delivery, could significantly improve customer experiences. Lastly, while service quality is a key driver, the remaining unexplained variance suggests other factors, such as product quality, pricing strategies, and farm accessibility, may also affect satisfaction. Future initiatives could adopt a more holistic customer-centered strategy, integrating these elements to achieve even higher levels of satisfaction and competitive advantage.

Abstract

Job satisfaction influences employee discipline. Employees who derive satisfaction from their work tend to demonstrate higher levels of discipline, whereas employees whose job satisfaction is not fulfilled are more likely to exhibit lower levels of discipline. Some employees arrive late or engage in activities such as playing games during working hours, which reflects a lack of discipline and hinders the achievement of company goals. Employee job satisfaction must be fostered as effectively as possible in order to enhance morale, dedication, affection for their work, and discipline. Job satisfaction is a positive emotional attitude that reflects an employee's affection for their work. This attitude is influenced by morale, discipline, and work performance. This study was conducted at Agia Sophia Tanjung Anom, Deli Serdang, with the aim of determining the level of employee job satisfaction at Agia Sophia Elementary School. Using a qualitative descriptive method, the study revealed that employees experienced dissatisfaction related to salary, workload, work equipment, the lack of assertiveness from leaders, and the monotonous nature of their tasks.
Keywords: Job satisfaction; Discipline; Time.

1. Introduction

The Indonesian business sector is currently experiencing rapid growth, resulting in increased competition. One way to achieve organizational goals is by developing reliable and high quality human resources, as they are the driving force that enables other company resources to function effectively. Human as an essential element of the company plays an important role in determining the success or failure of a company. One of the key sources of a company's success in achieving high performance is a qualified workforce with adequate work effectiveness. Company goals can be achieved when employees support each other. Therefore, the potential of human resources plays an important role as the primary actor directly involved in the company's success. Employee performances that yield products of good quality and quantity according to established standards contribute to gaining the trust of the community.

Agia Sophia Elementary School (SD) located in Tanjung Anom Deli Serdang is also known as Agia Sophia Orthodox Elementary School (SD). Based on the researcher's observations, some employees arrive late, use their cell phones during working hours, and show little concern for their surroundings. These behaviours reflect a lack of discipline, which in turn affects employee job satisfaction. According to (Mukhtar 2019) "Job satisfaction is an emotional attitude that is pleasant and loves one's job. This attitude is reflected by work morale, discipline, and work performance. This study aims to examine employee job satisfaction at Agia Sophia Elementary School (SD) Deli Serdang. The scope of the research

was limited to employee job satisfaction at Agia Sophia Elementary School (SD) located in Tanjung Anom, Deli Serdang, and the study was conducted from May to July. According to Rahmaoktaviani and Setiawan (2020), research methods are scientific approaches used to obtain data for specific purposes and applications. Research enables humans to utilize its findings, and in general, the data obtained can be applied to understand, address, and anticipate problems.

According to (Suyuti and Siraj 2019), employee job satisfaction must be created as well as possible so that employee morale, dedication, love, and discipline increase. According to (Surur 2022) job satisfaction is a person's general positive attitude towards their organizational life. According to (Pipit Muliyah, Dyah Aminatun, Sukma Septian Nasution, Tommy Hastomo, Setiana Sri Wahyuni Sitepu 2020) job satisfaction is a worker's feelings about various aspects of the work framework. According to (Nitisemito (2019:89) 2021) job satisfaction is a general attitude towards one's job, which shows the difference between the amount they believe they should receive. According to (Yanto, Widodo, and Susetyo 2022) Describes job satisfaction as a positive or negative attitude that individuals have towards their jobs.

According to (Rodríguez, Velastequí 2019) there are various understandings or limitations of job satisfaction. First, the understanding that views job satisfaction as a complex emotional reaction. This emotional reaction is a result of the drive, desire, demands and expectations of employees towards work that are connected to the realities felt by employees, thus causing a form of emotional reaction in the form of feelings of happiness, satisfaction or dissatisfaction. According to (Supriyadi 2021) job satisfaction is meant as an employee's emotional state where there is or is not a meeting point between the value of employee work rewards from the company and the level of reward value desired by the employee concerned. This work reward is either financial or non-financial.

According to (Yanto et al. 2022) describes job satisfaction as a positive or negative attitude that individuals have towards their work. Vecchio (1995) states job satisfaction as a person's thoughts, feelings and tendencies to act, which are a person's attitude towards work. Gibson (2000) states job satisfaction as the attitude that workers have about their work. Job Satisfaction Theory seeks to explain why some individuals are more satisfied with their jobs than others. It also aims to provide a basis for understanding the processes underlying employees' perceptions of job satisfaction. Among the prominent theories of job satisfaction are the Two-Factor Theory and the Value Theory. According to Apriasty & E. Simbolon (2022), factors influencing job satisfaction include both challenging work and monotonous tasks, with the latter often serving as a source of dissatisfaction reflected in high levels of boredom.

2. Methodology

The research design adopted in this study is a discourse analysis within a qualitative approach. Data were collected through participant observation and structured interviews. The analysis was conducted using the Miles and Huberman interactive model, which consists of three stages: data reduction, data display, and conclusion drawing.nThe data sources used in this study are internal, consisting of information originating from within the company that pertains to all organizational activities. The data collection methods used in this study is as follows:

a. Observation
b. Interview

This research was conducted at Agia Sophia Deli Serdang Elementary School (SD) located in Tanjung Anom with the following stages:

i. researcher determines the topic
ii. researcher identifies the problem and formulates the issues being faced

iii. researcher collected data related to the research by interviewing employees of SD Agia Sophia Tanjung Anom
iv. Compile the interview results and process the data using the data analysis method to obtain findings
v. Formulate overall research conclusions and provide useful suggestions for SD Agia Sophia Tanjung Anom

Agia Sophia Elementary School, also known as Agia Sophia Orthodox Elementary School, is an educational institution operated by the Indonesian Orthodox Faith Foundation, legally recognized as Yayasan Sahabat Iman Orthodox Indonesia. Established on July 17, 2000, the school embodies the values and teachings of the Orthodox Christian faith within the Indonesian education system. It is located in Tanjung Anom, Deli Serdang, and is one of the few elementary schools in Indonesia affiliated with the Orthodox tradition, fostering both academic growth and spiritual development grounded in Orthodox values. Towards the end of the 1999/2000 school year, a student asked the teacher:

"When we graduate from this kindergarten, which school will we attend?' The teacher shared this question with the Foundation administrators, who then discussed how best to respond. Driven by their strong conviction and determination, the Foundation administrators founded Agia Sophia Elementary School. On July 17, 2000, the first grade officially began, with Ir. ATB. Gultom, SE serving as Principal and Mrs. Surya Surlita Situmorang as the first-grade teacher. In the 2000/2001 school year, the combined enrolment of Kindergarten and Elementary School totalled 50 students.

"To create students who are intelligent, skilled, responsible, healthy, noble in character, faithful, and devoted to God Almighty." This is the core vision guiding the school's long-term, medium-term, and short-term goals. The vision motivates the school community to continually strive to realize it sustainably and achieve the school's objectives.

3. Results and Discussion

Based on the observations, the researcher concluded that several challenges exist in the workplace. There are recurring delays in salary payments, accompanied by employee dissatisfaction over compensation that is perceived as not proportional to the work performed. Despite these issues, employees generally manage to complete their tasks effectively and in line with their respective skill sets. However, many have expressed concerns about an excessive workload, often feeling burdened by the volume of tasks assigned. Additionally, complaints have been raised regarding the lack of sufficient office equipment needed to support their daily responsibilities. While the leader maintains a friendly and approachable relationship with employees, there appears to be a lack of firmness in implementing disciplinary measures when necessary.

Furthermore, there are instances where employees are required to take on tasks beyond their designated roles, contributing to feelings of overload and role ambiguity. Based on the results of interviews and observations, there is a consistent finding regarding employee dissatisfaction with salaries at Agia Sophia Elementary School, Tanjung Anom. Employees reported that their compensation does not align with the work performed, which was confirmed during observations. Additionally, in positions that match their job roles, employees are able to complete their tasks effectively, indicating that their skills are well-suited to their assigned responsibilities.

4. Conclusion

Employee job satisfaction at Agia Sophia Elementary School, Tanjung Anom, is generally positive in terms of job placement and the work environment. A supportive and comfortable

atmosphere enables staff to perform their duties effectively, and job placements that align with individual expertise contribute to the production of high-quality work. However, satisfaction is notably lower when it comes to salary, with employees expressing concerns that their compensation is not commensurate with the workload. This dissatisfaction is further compounded by instances where employees are assigned tasks beyond their official job descriptions, resulting in additional burdens and interfering with their primary responsibilities. Satisfaction also varies depending on job position and access to work-related resources, with some staff members needing to rely on personal equipment to fulfil their duties. Although the school's leadership is generally viewed as wise and approachable, a lack of firmness in enforcing discipline and the repetitive nature of certain tasks may negatively affect overall job satisfaction for some employees.

It is recommended that the school provide fair and appropriate salaries that reflect the workload and clearly define the responsibilities associated with each role to prevent the assignment of double duties. This aligns with Hasibuan (2007) theory, which emphasizes balanced compensation and workload management. Additionally, the school should pay closer attention to the individual needs of employees, particularly in ensuring access to adequate equipment and recognizing differences in tolerance for monotonous work. Providing the necessary tools and offering recognition or rewards can significantly boost motivation and performance. Finally, leadership should balance wisdom with firmness to ensure employees follow established rules and reduce the likelihood of repeated mistakes, thereby fostering a more disciplined and effective work environment.

THE INFLUENCE OF INFORMATION TECHNOLOGY, INFLUENCERS, AND CUSTOMER RELATIONSHIPS ON ATTRACTING VISITORS TO THE BEAUTY IN THE POT MEDAN RESTAURANT

Roma Ruli Ana Sihotang*, Cece

Marketing Management Department, Sukma School of Management, 20219 Medan City, North Sumatra, Indonesia

*Corresponding author e-mail address: romaruliana84@gmail.com

Abstract

This study aims to determine the influence of Information Technology, Influencers, and Customer Relationship on visitor interest in the Beauty in the Pot Restaurant in Medan. The method used in this study is quantitative descriptive with data collection techniques in the form of observation and distribution of questionnaires to individuals who have visited or are interested in the restaurant. Data analysis was conducted using SPSS version 25. The results of the study indicate that the three independent variables contribute 45.5% to visitor interest, while the remaining 54.5% is influenced by other variables not examined in this study. Additionally, the results also indicate a desire among customers to enhance their ability to utilize technology as a means of obtaining relevant information about the restaurant. Therefore, optimal use of digital media, collaboration with suitable influencers, and effective customer relationship management are crucial strategies for attracting visitor interest.
Keywords: Information Technology; Influencer; Customer Relationship; Visitor Interest

1. Introduction

In the digital era, the application of technology in marketing has significantly changed customer engagement strategies. Especially among the millennial generation, platforms such as Instagram and TikTok have become powerful tools to promote brands and influence consumer behaviour (Kapoor & Kapoor, 2021). The increasing number of new social media users has made businesses shift their marketing focus from traditional media to digital media to take advantage of the prevalence of social media which plays an important role in building brand awareness and direct interaction with consumers. Instagram, as one of the most popular social media platforms, has become an effective marketing tool with a visual format that allows companies to display their products in the form of attractive images and videos. The development of digital technology has changed the marketing landscape in various industries, including the hospitality industry. Marketing strategies that previously used traditional methods are now shifting to a digital approach, especially through the use of social media. (Kapoor and Kapoor, 2021). Influencers rely on the trust and relationships that influencers have built with their followers, allowing companies to expand their market reach in a more personal and effective way (Veirman, Cauberghe and Hudders, 2017).

Fig.1 Beauty in the Pot logo

The observed phenomena include the lack of visible use of technology for online interactions, minimal use of influencers to attract new customers, and suboptimal service interactions that can reduce customer retention. The potential of digital strategies, if fully implemented, can increase customer awareness, engagement, and revisit intentions (Veirman, Cauberghe & Hudders, 2017). Therefore, this study aims to analyze how information technology, influencers, and customer relationships influence customer interest in the restaurant, providing data-based insights for managerial improvement. The limitations of this research are:

- Focus on costumer at the Beauty in the Pot Restaurant Medan: this research is limited to Beauty In the pot Restaurant Medan as the research object. Therefore, the results and findings obtained may not be directly applicable to other locations.
- The research used information technology, influencers, and customer relationships as variables to increase visitor interest.
- Time continuity: the time limit for this research is from February to June 2025. Therefore, the influence of each variable may not be the same at any given time.
- Research Method: The analytical method and quantitative approach chosen will influence the results and conclusions obtained from this research.

2. Methodology

This study uses a descriptive-associative quantitative approach with the aim of determining the relationship between independent variables (X1: Information Technology, X2: Influencers, X3: Customer Relations) and dependent variables (Y: Customer Interest). The research was conducted at Beauty In The Pot Restaurant in Medan, located at Sun Plaza, Medan. The population in this study included all restaurant visitors, with a total of 80 respondents selected using total sampling technique. Data collection was conducted using a Likert scale questionnaire, interviews, documentation, and literature review. The variables are defined as follows:

- Information Technology: hardware, software, brainware (Azhar Susanto, 2023).
- Influencer: attractiveness, credibility, expertise (Luthfiany et al., 2018).
- Customer Relationship: technology, people, process (Fauziah, 2021).
- Customer Interest: transactional, preferential, and exploratory interest (Sari & Pangestuti, 2018).

The data were processed using SPSS version 25 by applying descriptive analysis, validity and reliability tests, multiple linear regression, and hypothesis testing (t-test and F-test). Research Location: The location of this research was the Beauty In the Pot Restaurant in Medan, located at Jl. KH. Zainul Arifin No. 7, Madras Hulu, Medan Polonia Sun Plaza District, G Floor, EL Block D No. 03, North Sumatra 20152. Population: A population is the entire generalized area consisting of subjects or objects with certain characteristics, which the researcher determines as the focus of the study and from which conclusions are drawn (Sugiyono, 2017). Based on this definition, a population can be defined as a group of people, events, or objects with certain characteristics that serve as the object of research. The population in this study was 80 visitors to the Beauty In the Pot Restaurant in Medan.

Operational Definition:
In this study, an operational definition refers to the description of research variables based on observable and empirically measurable characteristics. This definition is used to explain how each variable is practically defined within the research context, thus facilitating the measurement and analysis process.

- An independent variable is a variable that influences or causes changes in the dependent variable. In this study, the independent variables consist of three aspects: Information Technology (X1), Influencers (X2), and Customer Relationships (X3).

- A dependent variable is a variable that is influenced by or results from the independent variable. In the context of this study, the dependent variable studied is Visitor Interest (Y), which is the extent to which visitors are interested in visiting the Beauty In the Pot Restaurant in Medan because of the influence of these three independent variables.

Table 1. Operational Definition Table of Variables

Variable	Definition	Indicator	Scale
Visitor Interest	Interest in visiting can be interpreted as a person's drive or desire to come to or visit a particular tourist destination.	1. Desire to Transact 2. Interest Based on Preference 3. Interest in Exploration	Likert
Information Technology	Technology is a collection of tools, methods, and processes used to meet human needs and improve comfort and sustainability. Human use of technology began with efforts to utilize natural resources through the creation of simple tools as solutions to various needs.	1. Hardware 2. Software 3. Brainware (Individual)	Likert
Influencer	Influencer. This strategy has developed significantly in the digital era, with brands partnering with influential individuals on social media platforms to support the promotion of the products or services offered.	1. Attraction 2. Trust 3. Expertise	Likert
Customer Relationship	A customer is an individual or group of people who continually purchase and use products, whether goods or services. Therefore, the existence of customers plays a crucial role for a company, as it is through them that the company's operations can run optimally and support business growth and development.	1. Technology 2. People 3. Process	Likert

3. Results and Discussion

The characteristics of the research respondents were obtained from personal data or subject identities listed on the scale collected in this study. The number of respondents was 80 people based on gender and age among customers of the Beauty In the Pot Restaurant in Medan. The following is a description and identity of the research respondents:

Table 2. Characteristics of Respondents Based on Gender

		Frequency	Percent	Valid Percent	Cumulative Percent
Valid	Laki-Laki	25	24.5	31.3	31.3
	Perempuan	55	53.9	68.8	100.0
	Total	80	78.4	100.0	
Missing	System	22	21.6		
Total		102	100.0		

Based on the table above, the number of respondents based on gender is 80 customers of Restaurant Beauty in the Pot Medan, with more women than men.

Table 3. Characteristics of Respondents Based on Age

		Frequency	Percent	Valid Percent	Cumulative Percent
Valid	18-21 Tahun	18	17.6	22.5	22.5
	22-25 Tahun	34	33.3	42.5	65.0
	26-30 Tahun	23	22.5	28.7	93.8
	>30 Tahun	5	4.9	6.3	100.0
	Total	80	78.4	100.0	
Missing	System	22	21.6		
Total		102	100.0		

Based on the table above, the number of respondents by age is 80 restaurant customers, both those who can afford Medan and those who are productive, namely 22-25 years old. Multiple Linear Regression Test Results. This test was conducted to determine the effect of Information Technology, Influencers, Customer Relationships, and Customer Loyalty on attracting visitors to the Beauty in the Pot Medan Restaurant, which was carried out by the Beauty in the Pot Medan Restaurant Employees. The following is a table of multiple linear regression test results, namely:

Table 4. Multiple Linear Regression Test Results

Model	Unstandardized Coefficients		Standardized Coefficients	T	Sig.
	B	Std. Error	Beta		
1 (Constant)	6.439	3.371		1.910	.060
Teknologi_Informasi	.134	.108	.168	1.231	.222
Influencer	.269	.140	.319	1.917	.059
Customer_Relationship	.239	.130	.250	1.840	.070

Based on the test results above, the multiple linear regression equation is obtained as follows:

$$Y = 6.439 + 0.134\ (X1) + 0.269\ (X2) + 0.239\ (X3) \quad (1)$$

In the multiple linear regression model, the constant value of visitor interest is 6.439, meaning that if the value of the independent variables of information technology, influencers and customer relationships is 0, then the dependent variable of visitor interest is 6.439. The regression coefficient of each independent variable is positive, meaning that visitor interest in the Beauty In the Pot Medan restaurant can be influenced by information technology, influencers, and customer relationships.

a. Hypothesis Testing

The determination coefficient quantifies the magnitude of the independent variable (X) 's influence on the dependent variable (Y).

Table 5. Multiple Linear Regression Test Results

Model	R	R Square	Adjusted R Square	Std. Error of the Estimate
1	.674[a]	.455	.433	3.995

Based on the test above, the determination coefficient value obtained is 0.455 or 45.5% stating that the percentage of influence of independent variables (Information Technology, Influencers, and Customer Relationships) on the dependent variable (Visitor Interest) is 45.5%. The remaining 54.5% is explained or influenced by other variables not used as statements in this study.

a. Simultaneous Test (F test)

Table 6. Snail Test Results

Model		Sum of Squares	Df	Mean Square	F	Sig.
1	Regression	1012.180	3	337.393	21.136	.000[b]
	Residual	1213.208	76	15.963		
	Total	2225.388	79			

Based on the table above, the F-count value of 21.136> from the F-table value of 2.67 and the significant value of 0.000 < from alpha 0.05. So the decision taken, H0 is rejected, H1 is accepted, thus simultaneously Information Technology, Influencers, and Customer Relationships have a positive and significant effect on Visitor Interest in the Beauty in the Pot Medan Restaurant.

b. Simultaneous Test (F test)

Fig. 7: Partial Test Results

Model		Unstandardized Coefficients		Standardized Coefficients	T	Sig.
		B	Std. Error	Beta		
1	(Constant)	6.439	3.371		1.910	.060
	Total_X1	.134	.108	.168	1.231	.222
	Total_X2	.269	.140	.319	1.917	.059
	Total_X3	.239	.130	.250	1.840	.070

From the test results above, it is explained that:

- The T-count value on the Information Technology variable is 1.231 <Ttable 1.689 and a significant value of 0.222> from alpha 0.05 (5%), then H0 is accepted and H1 is rejected, thus partially Information Technology does not affect Visitor Interest.
- The T-count value on the Influencer variable is 1.917> Ttable 1.689 and a significant value of 0.059> from alpha 0.05 (5%), then H0 is accepted and H1 is rejected, thus partially Influencer does not affect Visitor Interest.
- The T-count value on the Customer Relationship variable is 1.840> Ttable 1.689 and a significant value of 0.070 <from alpha 0.05 (5%), then H0 is accepted and H1 is rejected, thus partially Customer Relationship does not affect Visitor Interest

Based on the results of the partial t-test, it is known that the three variables in this study, namely Information Technology, Influencers and Customer Relationships, do not have a significant effect on the interest of visitors to the Beauty In the Pot Medan restaurant, this can be seen from the significance value of the three variables which are all at the critical limit of 0.05, so that H0 is accepted and H1 is rejected. These results indicate that although in theory the three variables have the potential to influence consumer interest, in practice they have not been able to provide a significant real impact. The use of information technology must be able to support effective and interactive communication in order to provide added value for consumers (Jogiyanto, 2007)

Likewise, the influence of influencers will be effective only if there is a match between the character of the influencer and the target audience (Sumarwan, 2011). Strong customer relationships can build loyalty and ongoing interest, but this requires consequences in service and personal communication that is right on target (Kotler and Keller, 2012). Thus, these results indicate that restaurants need to re-evaluate their strategies in utilizing technology, selecting influencers and approaching customers to be more effective in increasing visitor interest.

4. Conclusion

Based on the results of data analysis conducted through partial multiple linear regression testing (t-test), it can be concluded that the three independent variables in this study, namely Information Technology, Influencers, and Customer Relationship, do not have a significant partial effect on the interest of visitors to the Beauty In the Pot restaurant in Medan. This is evidenced by the statistical calculations showing that the significance levels of the three variables are greater than the significance level (α) of 0.05, specifically Information Technology at 0.222, Influencer at 0.059, and Customer Relationship at 0.070. Therefore, statistically, the null hypothesis (H0) is accepted, and the alternative hypothesis (H1) is rejected.

These results indicate that, individually, each variable has not been able to make a significant contribution in influencing visitor interest in the restaurant. However, theoretically, these three variables are considered to have the potential to influence consumer behaviour. For example, the use of information technology can help companies convey information quickly and accurately to customers and enhance the user experience. However, if the technology is not maximized or does not align with the preferences of the target consumers, its impact becomes suboptimal (Jogiyanto, 2007). An influencer has the power to shape opinions and influence consumer purchasing decisions, especially if they have credibility and relevance to the promoted product (Sumarwan, 2011). However, if the chosen influencer does not align with the characteristics of the target market, the message conveyed will not be effective in attracting consumer interest. Similarly, customer relationships: Building good long-term relationships with customers can increase loyalty and repeat visits (Kotler and Keller, 2012), but if the approach used is too general, unprofessional, or inconsistent, the relationship will not be strong enough to significantly influence visitor interest.

Thus, this study identifies that Beauty In the Pot Medan restaurant needs to evaluate the strategies used in the areas of information technology, influencer utilization, and customer relationship approaches. These strategies must be tailored to the characteristics and needs of consumers to be more relevant and effective in attracting visitor interest. Additionally, there may be other factors beyond these three variables that are more dominant in influencing visitor interest, such as food quality, price, location, or direct promotions, which could be the focus of further research. Suggestions for next research include adding or replacing other potentially more relevant and influential variables, such as food quality, price, restaurant atmosphere, and comfort. With these developments, it is hoped that future research can make a stronger contribution to understanding the factors influencing consumer interest in the modern restaurant sector.

DEVELOPMENT OF A WEB-BASED POINT OF SALES (POS) INFORMATION SYSTEM FOR COFFEE SHALTER

Nopita Sari Br Tarigan*, Guidio Leonarde Ginting

Management Study Program, Sekolah Tinggi Ilmu Manajemen Sukma, 20219 Medan, North Sumatra, Indonesia

*Corresponding author e-mail address: nopitatarigan167@gmail.com

Abstract

The purpose of this research is to design and implement an effective web-based Point of Sales (POS) information system for managing raw materials and menu items at Coffee Shelter, while also evaluating the impacts of system implementation on daily café operations. The study aims to provide an integrated solution that enhances efficiency in sales transactions, streamlines inventory management, and supports data-driven decision-making. A qualitative research approach is employed, utilizing observation, interviews, and literature review as primary methods for data collection. Observations are carried out to understand the current workflow and operational challenges faced by Coffee Shelter. In-depth interviews with the café owner and staff help uncover system requirements and user expectations. In parallel, literature studies are conducted to explore the theoretical foundations of POS systems, including system architecture, usability, and implementation strategies. The anticipated result of this research is the development of a user-friendly, web-based POS system that facilitates faster transactions, automates inventory tracking, and generates real-time sales reports. These features are expected to improve operational control, reduce manual errors, and support strategic planning within the café environment.
Keywords: POS; System; Transaction.

1. Introduction

The increasing popularity of coffee consumption in Indonesia has led to the rapid development of modern cafés offering a wide variety of coffee-based beverages and snacks. Coffee Shelter, located in Medan Selayang, is one such café that serves various contemporary coffee drinks and light foods. However, its current operational activities—such as recording sales transactions, managing inventory, and handling customer orders—are still performed manually using paper-based methods or simple spreadsheets, which can be inefficient and prone to errors. Manual data handling has caused several operational challenges for Coffee Shelter including slow services, order inaccuracies, and difficulties in real-time stock monitoring. These inefficiencies not only reduce service quality but may also lead to customer dissatisfaction and financial losses due to mismanaged inventory. Therefore, implementing a well-structured information system is essential to improve transaction accuracy, inventory control, and service speed. To address these problems, a web-based Point of Sales (POS) system is proposed as a solution. The system is expected to automate the sales and inventory processes in an integrated and real-time manner. A web-based POS provides flexibility, accessibility, and centralized data management that can enhance operational efficiency and improve decision-making. The system would also offer a user-friendly interface for both cashiers and admins, enabling them to interact seamlessly with the platform.

Several previous studies support the effectiveness of web-based POS systems. found that implementing such systems improved transaction management efficiency at Toko A3 Jaya. showed that a web-based POS at Point Coffee Banjarmasin accelerated payment processes and increased accuracy. Emphasized that real-time data access from POS applications supports more effective managerial decision-making. These studies indicate that a well-

developed POS system is critical to solving operational issues like those faced by Coffee Shelter. Based on these findings, this research aims to design and implement a web-based POS information system specifically tailored for Coffee Shelter. The system will be developed to meet the café's operational needs, focusing on transaction recording, menu management, and inventory monitoring. This initiative is expected to significantly enhance service performance, reduce human error, and ultimately support the café's business growth.

2. Methodology

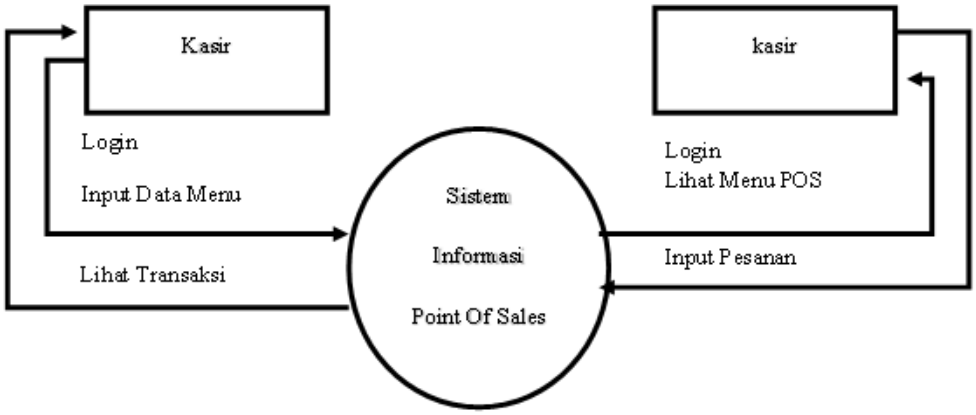
This study employs a qualitative approach using a descriptive method. This approach was chosen because it allows researchers to explore phenomena in depth, particularly regarding operational processes and issues in transaction recording at Coffee Shelter. The descriptive method is used to describe actual conditions in the field and to provide a systematic explanation of the observed processes without manipulating variables. The aim of this study is to design a web-based Point of Sales (POS) information system that aligns with real operational needs, which makes this approach appropriate. The research was conducted at Coffee Shelter, a café located on Jalan Bunga Ester XII, Padang Bulan, Medan Selayang, from March to May 2025. Coffee Shelter was selected as the research site due to its real-life problems in recording transactions and managing inventory, which are still handled manually. These manual processes often result in service delays and recording errors. Considering these issues, the development of a web-based POS system is expected to improve efficiency and accuracy in the café’s daily operations.

The types of data used in this study are primary data and secondary data. Primary data were collected directly through interviews with the café owner and staff, as well as through observations of the inventory and sales transaction processes. Primary data plays a crucial role in qualitative research because it comes directly from first-hand experience or field conditions. As states, primary data are original sources of information obtained specifically for the research objectives. Meanwhile, secondary data were gathered from various references such as literature, documents, books, scientific journals, and previous studies relevant to web-based POS system development. The data collection techniques used in this research include observation, interviews, and literature review. Direct observations were conducted to examine the daily operational activities at Coffee Shelter, including how inventory and transactions are recorded. According to [5], observation is an effective data collection method that allows researchers to obtain contextual insights through direct examination of the research object. Additionally, interviews were carried out with the café’s owner and staff to explore system requirements, operational challenges, and their expectations for the new system. Interviews facilitate deeper understanding by allowing two-way communication with key informants [6]. Literature review was also conducted to gather theoretical foundations from sources related to information systems, web technologies (PHP, HTML, MySQL), and POS concepts to support the system design.

The data analysis process in this study follows five stages as described by [6]: data collection, data reduction, data presentation, conclusion drawing, and evaluation. Data were first collected using observation, interviews, and literature review. The next step was data reduction, where relevant information was filtered and focused on the research objectives. The reduced data were then organized and presented in a structured way to facilitate analysis. Conclusions were drawn based on the patterns and findings from the field. Finally, an evaluation was conducted to ensure the accuracy and consistency of the results and to provide recommendations for future system development. Through the qualitative approach and descriptive method, this study is expected to produce a web-based POS information system that not only fits the operational conditions of Coffee Shelter but also improves the effectiveness of transaction recording and inventory management in an integrated, real-time, and accurate manner.

3. Results and Discussion

The results of the design and development of the web-based Point of Sales (POS) information system at Coffee Shelter show that the system was successfully implemented according to operational needs. The system replaces the previous manual processes—such as handwritten records and spreadsheets—with a structured, efficient web application accessible to both admin and cashier. It simplifies the sales process, accelerates transaction recording, and supports real-time data monitoring to aid in decision-making. To illustrate how the system works, a Data Flow Diagram (DFD) was created to show the interaction between external entities—namely the cashier and the admin—and the core processes of the POS system. The DFD consists of a single main process that represents the entire system, with the cashier interacting to record orders, view menus, and access transaction data, while the admin manages the menu data and edits transaction records.



Fg. 1. Data Flow Diagram (DFD)

The database structure for the system consists of several main tables, including users, roles, menu, transaction, transaction detail, and payments. The users table stores information on both admin and cashier accounts, while the roles table defines their access levels. The menu table holds data on available food and beverage items. Meanwhile, the transaction and transaction detail tables record each sale and its detailed items. The payments table logs payment information for each transaction.

Table 1. *Category*

Column	Data Type	Description
category_id	INT(11)	PRIMARY KEY, AUTO_INCREMENT
category_name	VARCHAR(50)	NOT NULL, UNIQUE, nama kategori menu

Table 2. Menu

Column	Data Type	Description
menu_id	INT(11)	PRIMARY KEY, AUTO_INCREMENT
menu_name	VARCHAR(100)	NOT NULL, nama menu
price	DECIMAL(10,2)	NOT NULL, harga menu
category_id	INT(11)	NOT NULL, FOREIGN KEY ke categories(category_id)
description	TEXT	opsional, deskripsi menu
image	VARCHAR(255)	opsional, nama file gambar
status	ENUM(...)	status ketersediaan menu (default: 'available')
created_at	TIMESTAMP	otomatis, waktu dibuat
updated_at	TIMESTAMP	otomatis, waktu update terakhir

Table 3. Transaction

Column	Data Type	Description
order_id	INT(11)	PRIMARY KEY, AUTO_INCREMENT
no_bon	VARCHAR(50)	NOT NULL, nomor bon
order_date	DATETIME	waktu pemesanan (default: current_timestamp)
user_id	INT(11)	NOT NULL, FOREIGN KEY ke users(user_id)
total_price	DECIMAL(12,2)	NOT NULL, total harga pemesanan
order_status	ENUM(...)	status pesanan (default: 'pending')

Table 4. Transaction Detail

Column	Data Type	Description
detail_id	INT(11)	PRIMARY KEY, AUTO_INCREMENT
order_id	INT(11)	NOT NULL, FOREIGN KEY ke orders(order_id)
menu_id	INT(11)	NOT NULL, FOREIGN KEY ke menu_items(menu_id)
quantity	INT(11)	NOT NULL, jumlah item dipesan
subtotal_price	DECIMAL(12,2)	NOT NULL, total harga berdasarkan kuantitas

Table 5. Payment

Column	Data Type	Description
payment_id	INT(11)	PRIMARY KEY, AUTO_INCREMENT
order_id	INT(11)	NOT NULL, FOREIGN KEY ke orders(order_id)
payment_method	ENUM(...)	NOT NULL, metode pembayaran (cash, credit_card, dll)
amount_paid	DECIMAL(12,2)	NOT NULL, jumlah uang yang dibayarkan
payment_date	DATETIME	waktu pembayaran (default: current_timestamp)
payment_status	ENUM(...)	status pembayaran (default: 'pending')

Table 6. Role

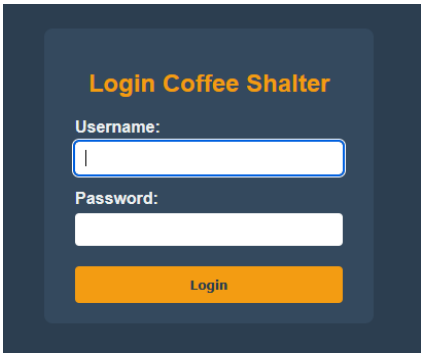
Column	Data Type	Description
role_id	INT(11)	PRIMARY KEY, AUTO_INCREMENT
role_name	VARCHAR(50)	NOT NULL, UNIQUE, nama peran (kasir, dll)
description	TEXT	opsional, deskripsi peran

Table 7. User

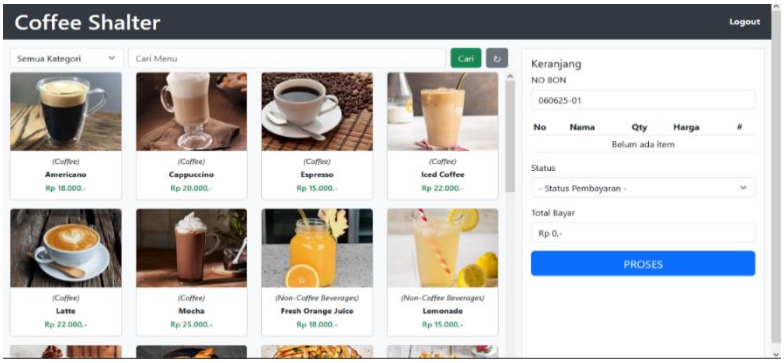
Column	Data Type	Description
user_id	INT(11)	PRIMARY KEY, AUTO_INCREMENT
username	VARCHAR(50)	NOT NULL, UNIQUE, nama pengguna
password	VARCHAR(255)	NOT NULL, hash kata sandi
full_name	VARCHAR(100)	NOT NULL, nama lengkap pengguna
role_id	INT(11)	NOT NULL, FOREIGN KEY ke roles(role_id)
last_login	DATETIME	opsional, waktu terakhir login
created_at	TIMESTAMP	waktu pembuatan akun
updated_at	TIMESTAMP	waktu pembaruan terakhir data akun

The user interface is designed to be user-friendly and accessible for both cashier and admin roles. The interface includes key pages such as the login screen, admin dashboard, menu management, transaction management, and transaction details. Admins can manage menu data, view reports, and configure user accounts, while cashiers can efficiently record transactions through a streamlined input page. The overall layout is kept simple and responsive to support smooth daily operations.

The system was implemented using PHP and MySQL for the backend, along with HTML, CSS, and Bootstrap for the frontend interface. System testing was conducted on all major functions including login, transaction input, menu management, and reporting. The results confirmed that all features functioned as intended. Screens such as login, dashboard, transaction list, transaction details, and cashier pages all displayed correctly and responded well.



Fg. 2. Login Page



Fg. 3. POS Page

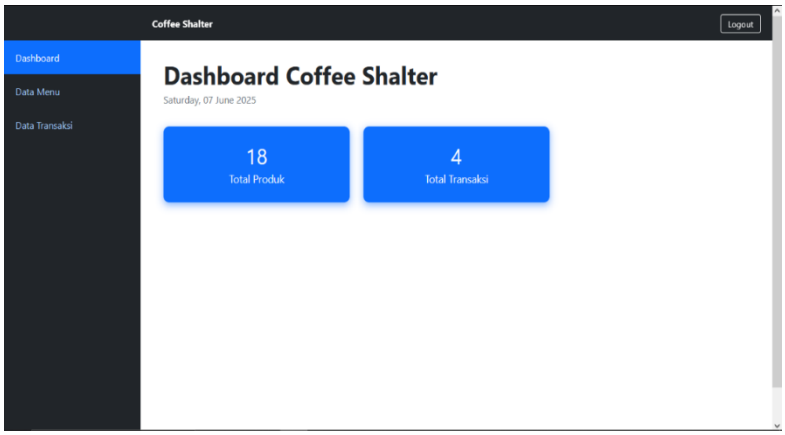


Fig. 4. Dashboard Page

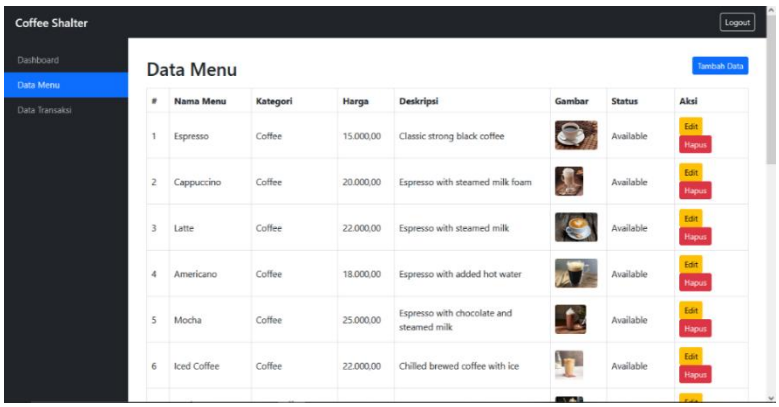

Fig. 5. Menu Page

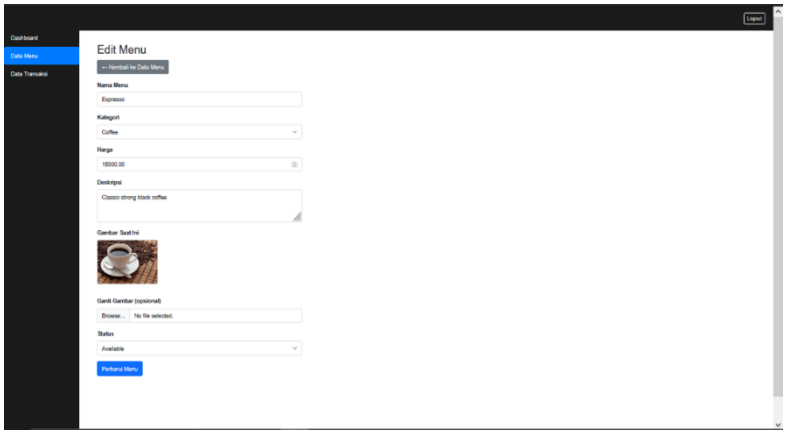

Fig. 6. Add / Edit Menu Page

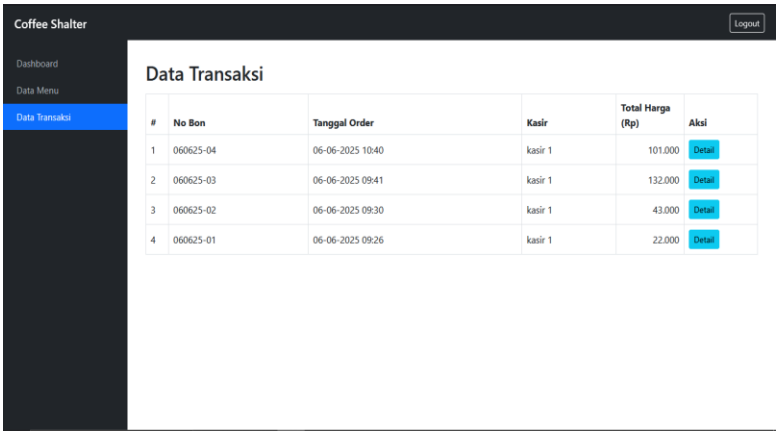

Fg. 7. Transaction Page

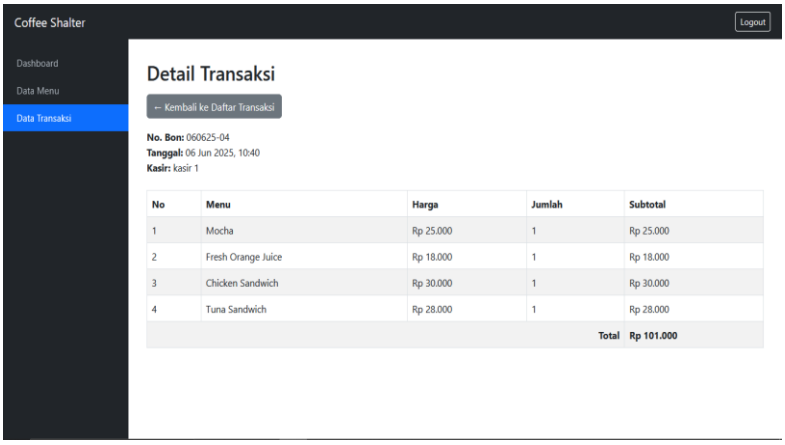

Fig. 8. Detail Transaction Page

Overall, the web-based POS system developed for Coffee Shelter successfully addresses the challenges of manual recordkeeping previously faced by the business. It simplifies transaction processes, reduces errors, and improves the speed and accuracy of service. With its clear workflow and intuitive interface, the system enhances operational efficiency and provides reliable control over sales activities.

4. Conclusion

Based on the design and implementation of the web-based Point of Sales (POS) information system at Coffee Shelter, it can be concluded that the system was successfully developed according to the operational needs of the business. The system replaces manual recording processes with a digital platform, thereby improving work efficiency, speeding up transaction input, and reducing errors in data management. The developed system provides essential features such as login access, menu management, transaction processing, receipt printing, and sales reporting. With a simple interface and a clear workflow, the system makes it easier for both the admin and the cashier to carry out their respective tasks. All data is stored in a centralized database, allowing for easier retrieval, summarization, and transaction analysis. Overall, the web-based POS system has proven effective in addressing the operational challenges previously faced by Coffee Shelter. It contributes directly to smoother operations and supports faster, more accurate decision-making. The success of this system implementation highlights the importance of digitizing sales processes as a step towards improving professionalism and efficiency in business management.

DESIGNING THE ERLANGGA SHOP WEBSITE AS A PROMOTIONAL AND INFORMATIVE PLATFORM TO IMPROVE BRAND AWARENESS AND SALES

Juwita Dipanti*, Guidio Leonarde Ginting

Management Study Program, Sekolah Tinggi Ilmu Manajemen Sukma, 20219 Medan, North Sumatra, Indonesia

*Corresponding author e-mail address: dipantijuwita@gmail.com

Abstract

This research aims to design the Erlangga Shop website as an effective promotional and informational medium to enhance brand awareness and product sales. The primary focus of this study is to explore design elements that can attract visitors' attention while creating a positive user experience and encouraging further interaction with the brand. The research method employed is qualitative in nature, utilizing observation, interviews, and literature studies to gather relevant data regarding user needs and best practices in web design. Through observations of user behaviour and interviews with business owners as well as potential customers, it is expected to gain in-depth insights into their preferences regarding the appearance and functionality of the website. Preliminary user feedback and basic usability testing were also considered during the design process, indicating that a clean layout, responsive interface, and simplified navigation significantly improve user satisfaction and engagement. The anticipated outcome of this research is the creation of an Erlangga Shop website that is not only visually appealing but also easy to navigate; thus significantly enhancing brand awareness and driving increased product sales through digital platforms.
Keywords: Website; Product; Brand.

1. Introduction

In the digital era, the development of information and communication technology has encouraged micro, small, and medium enterprises (MSMEs) to utilize the internet as a promotional tool. One of the most effective strategies to reach a wider audience and build brand identity is through the creation of a professional and informative website. For fashion businesses such as Erlangga Shop, the lack of a digital platform becomes a barrier to promoting products efficiently, especially in an increasingly competitive online market. Fashion is not only a lifestyle but also a growing business sector that relies heavily on visual appeal and brand awareness. Brand awareness plays a crucial role in influencing customer preferences and trust in a product. To compete with other fashion brands, Erlangga Shop must increase its visibility and engagement with potential customers. This can be achieved by designing a website that not only showcases products but also delivers clear, structured information to enhance the customer experience.

Previous studies have shown the importance of digital media in brand communication and promotion. (Rakhmadhona 2020) demonstrated that digital marketing strategies through social media significantly increase brand awareness. (Kurniasari 2023) emphasized the importance of websites as promotional media for MSMEs. (Aryanto et al. 2024) also found that a website's visual quality and usability positively influence consumer buying decisions, particularly among millennials. These findings support the notion that a well-designed website can serve as a strategic medium to build brand awareness and boost customer interest. However, many local businesses still do not utilize websites optimally. Either the design is unattractive, the content is not updated, or the information is difficult to access. A well-developed website is not only a promotional tool but also a communication bridge between

business and consumer. Therefore, the design must consider user experience, responsive layout, ease of access, and clarity of information.

This research aims to design a website for Erlangga Shop as a promotional and informational media that helps increase brand awareness and supports potential sales growth. The system will be designed to display product information, categories, and promotional content clearly and attractively. With a structured interface and user-focused design, the website is expected to become a valuable asset for Erlangga Shop in expanding its reach and building a strong digital brand identity.

2. Methodology

This study adopts a descriptive qualitative approach aimed at designing a website to serve as a promotional and informational medium for Erlangga Shop, with the objective of increasing brand awareness and attracting customer interest. The research was conducted at the Erlangga Shop business location from March to May 2025. The location was chosen because it reflects the focus of the study: a small-medium fashion business that requires digital promotion support through a structured information system. The data used in this study consist of primary data and secondary data. Primary data were obtained through direct observation of business activities at Erlangga Shop and interviews with the store owner to identify system needs and promotional challenges. Meanwhile, secondary data were collected from literature reviews of scientific journals, articles, and books related to digital promotion and web-based information system design. According to Rohmah (2024), secondary data are crucial for strengthening the theoretical foundation and supporting system design based on real user needs. Observational techniques used in this study also align with (Ismail 2020), who asserts that observation allows researchers to understand user activity and system requirements from a functional perspective.

Data collection methods in this study include field research and literature studies. Field research consisted of observing the existing promotional processes and interviewing the business owner to obtain in-depth information. Literature studies were used to support the development of a theoretical framework on digital promotion strategies and web-based system development. As stated by (Sugiyono 2020), qualitative methods are effective in capturing comprehensive data, especially in system design that directly relates to user interaction and experience. Data were analysed using the Miles and Huberman model, which involves four stages: data collection, data reduction, data presentation, and conclusion drawing. Data reduction was carried out by filtering relevant information from the observations and interviews. The selected data were then presented in the form of narratives and system design schemes. Finally, conclusions were drawn based on the field findings and user needs, which were used as the foundation for designing the proposed website system.

Through this approach and methodology, the study is expected to produce a website design that is not only functional but also aligned with the practical needs of Erlangga Shop in enhancing brand visibility, delivering structured product information, and expanding digital marketing reach.

3. Results and Discussion

The results of this research are presented through the implementation of a web-based information system in the form of the Erlangga Shop website. Before the implementation process, a Data Flow Diagram (DFD) was designed to illustrate the flow of data between users and the system. The context diagram shows two main entities interacting with the system: admin and visitors. The admin is responsible for managing product and promotion data, while visitors can only view product listings and their details. All main processes are identified using

standard DFD notations to represent the flow of input and output data and the internal system processes (Safwandi 2021).

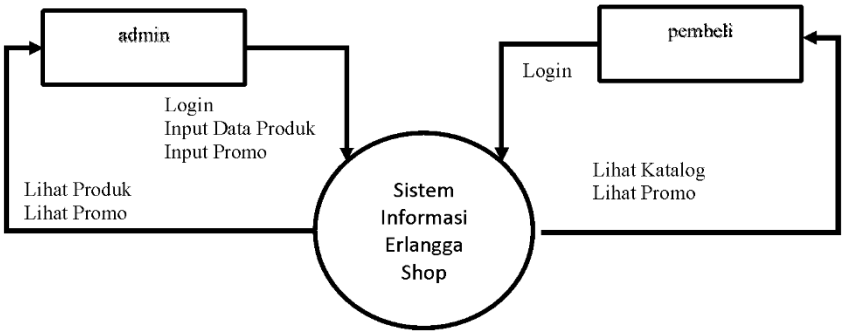

Fig. 1. Data Flow Diagram (DFD)

As the foundation for system development, a structured database design was created consisting of several key tables. These include the users table, which stores user data such as name, email, and role; the product category table for organizing fashion categories; the product table for storing product names, descriptions, prices, images, and category references; and the promo, promo_kategori, and promo_produk tables used for managing promotional data either by product or category. To support personalization and behaviour analysis, the log browsing table and recommendation table were also developed (Coronel 2020).

Table 1. Users

Column	Data Type	Description
user id	INT(11)	PRIMARY KEY, AUTO_INCREMENT
full name	VARCHAR(100)	NOT NULL, nama lengkap pengguna
email	VARCHAR(100)	NOT NULL, UNIQUE, alamat email
password_hash	VARCHAR(255)	NOT NULL, kata sandi (plaintext atau hash)
role	ENUM('admin','pelanggan')	DEFAULT 'pelanggan', peran pengguna
registration date	DATETIME	DEFAULT CURRENT_TIMESTAMP, waktu registrasi

Table 1 displays the structure of the users table, which stores user information such as name, email, role, and registration time.

Table 2. Product Category

Column	Data Type	Description
category id	INT(11)	PRIMARY KEY, AUTO_INCREMENT
category name	VARCHAR(50)	NOT NULL, UNIQUE, product name category

Table 2 defines the product category table used to organize products based on their respective categories.

Table 3. Product

Column	Data Type	Description
product id	INT(11)	PRIMARY KEY, AUTO_INCREMENT
product name	VARCHAR(100)	NOT NULL, product name
description	TEXT	Product description
price	DECIMAL(10,2)	NOT NULL, price
picture	VARCHAR(255)	Path/filename, picture
Category id	INT(11)	FOREIGN KEY → kategori_produk.id_kategori
Input date	DATETIME	DEFAULT CURRENT_TIMESTAMP, waktu input data
Index		Untuk percepat query berdasarkan kategori

Table 3 contains the structure of the product table, including product name, description, price, image, and its category reference.

Table 4. Promo

Column	Data Type	Description
Promo id	INT(11)	PRIMARY KEY, AUTO_INCREMENT
Promo name	VARCHAR(100)	NOT NULL, judul/tema promo
description	TEXT	Rincian promo
Pct deduction	DECIMAL(5,2)	Presentase diskon (mis. 10.00 = 10 %)
Start date	DATE	Tanggal mulai promo
Last date	DATE	Tanggal akhir promo
active	BOOLEAN	DEFAULT 1 (1 = aktif, 0 = nonaktif)

Table 4 shows the promo table that holds information about promotional campaigns including title, discount percentage, and active period.

Table 5. Promo Category

Column	Data Type	Description
id_promo	INT(11)	PRIMARY KEY (gabung), FOREIGN KEY → promo.id_promo
id_kategori	INT(11)	PRIMARY KEY (gabung), FOREIGN KEY → kategori_produk.id_kategori

Table 5 illustrates the promo_category table used to link promotions to specific product categories.

Table 6. Product Promo

Column	Data Type	Description
id_promo	INT(11)	PRIMARY KEY (gabung), FOREIGN KEY → promo.id_promo
id_produk	INT(11)	PRIMARY KEY (gabung), FOREIGN KEY → produk.id_produk

Table 6 outlines the promo_product table, which connects promotions directly to individual products.

Table 7: Search Log

Column	Data Type	Description
id_log	BIGINT	PRIMARY KEY, AUTO_INCREMENT
id_user	INT(11)	FOREIGN KEY → users.id_user, pengguna yang melihat produk
id_produk	INT(11)	FOREIGN KEY → produk.id_produk, produk yang dilihat
waktu	DATETIME	DEFAULT CURRENT_TIMESTAMP, waktu kunjungan

Table 7 describes the log_browsing table that logs user interactions with product views on the website.

Table. 8. Product Recommendation

Column	Data Type	Description
id_user	INT(11)	PRIMARY KEY (gabung), FOREIGN KEY → users.id_user
id_produk	INT(11)	PRIMARY KEY (gabung), FOREIGN KEY → produk.id_produk

Table 8 presents the recommendation table used to store product recommendations tailored to each user.

During the system design phase, the user interface was created for both visitor and admin roles. The visitor interface includes the homepage with general information and promotions, a product page with filtering and search features, a product detail page, and login/register pages. For admin users, pages were designed for the dashboard, product management, promotion management, and pages to add, edit, and delete product and promotion entries. These interface designs are described narratively in this section and do not require image inserts, as

the layout and navigation logic are explained according to user needs and the promotional objectives of the business. After the design process, system implementation and testing were carried out using PHP as the programming language and MySQL as the database. The implementation results are shown through active web pages featuring login, personalized product recommendations based on categories or visitor behaviour, and promotional displays where applicable. Key resulting pages include the homepage, product listings, product detail views, admin dashboard, and product and promotion management pages. The system output images should be inserted here as visual representations of the final implementation.

Fig. 2. Home Page

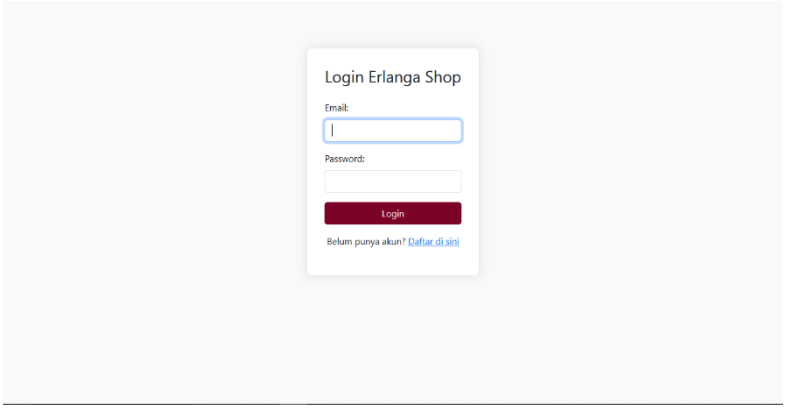

Fig. 3. Login Page

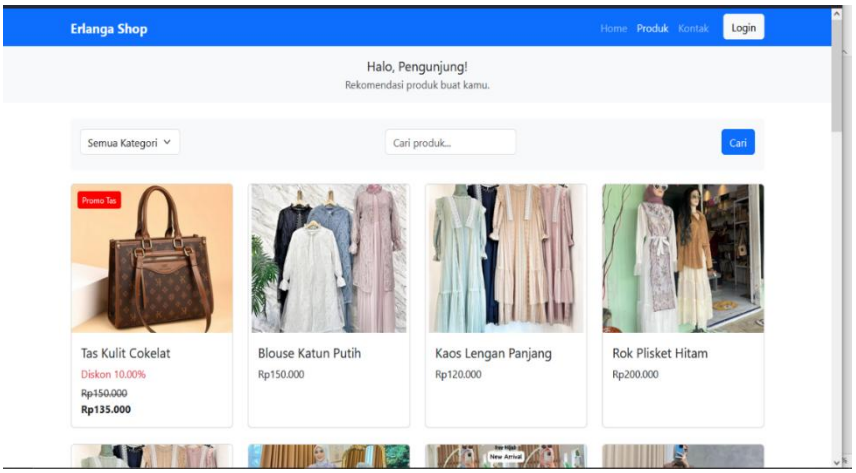

Fig. 4. Product Catalogue Page

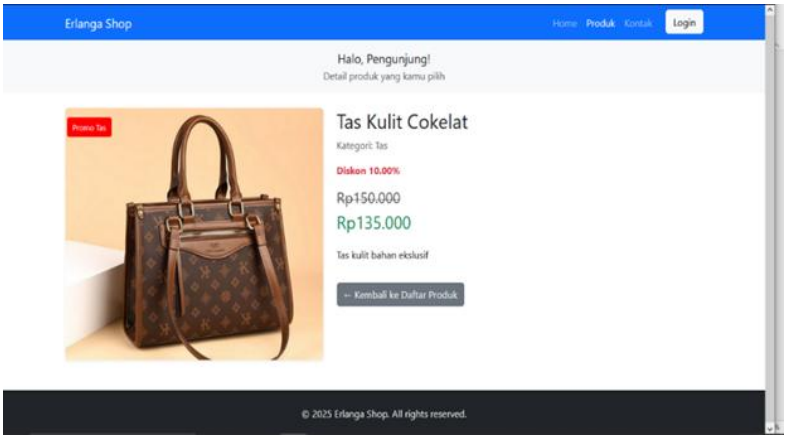

Fig. 5. Product Detail and Promo Page

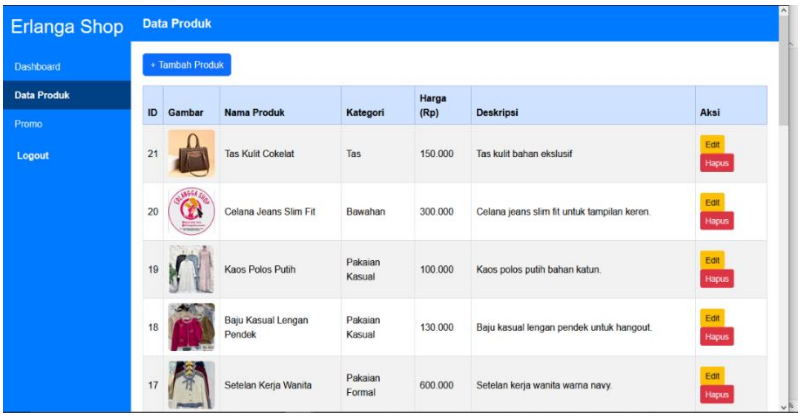

Fig. 6. Data of Product Page

The design of the Erlangga Shop website as a promotional and informational platform aims to enhance brand awareness and support increased online sales. This responsive and user-friendly website allows visitors to easily access structured product information, current promotions, and available categories. By utilizing modern web technologies and database integration, the system dynamically displays product listings and ongoing offers, making it easier for users to find attractive deals. Features like search and category filters streamline the shopping experience, while user authentication adds a layer of personalization and security. The website is built using the Bootstrap framework to ensure consistent, responsive design across devices, reinforcing a professional and modern brand image. Additionally, the admin-friendly content management system allows for efficient updates of products and promotions. Ultimately, the Erlangga Shop website serves as an effective tool for reaching a broader audience, providing reliable product information, fostering customer engagement, and strengthening the brand's position in the competitive digital market.

4. Conclusion

Based on the design and implementation of the Erlangga Shop website as a promotional and informational medium, it can be concluded that the developed system effectively addresses the research questions. First, the website successfully presents product and promotional information in a structured and appealing manner, which significantly contributes to increasing Erlangga Shop's brand awareness. The website was designed as a digital catalogue that replaces conventional promotional methods that previously had limited reach. Second, the user interface was designed with a user-friendly and responsive approach using the Bootstrap framework, providing a pleasant and intuitive experience. The colour scheme, layout, and navigation are aligned with the brand identity and user needs, supporting a more efficient and

enjoyable product browsing experience. Third, the system features such as product search, category filters, and promotional tags offer convenience for users in finding the products they are interested in. These features enhance user interaction with the website and create greater opportunities to attract customer attention toward the displayed products.

In addition, the presence of the website provides benefits for the admin, allowing easy content management, real-time updates, and broader digital promotional reach. The system also enhances the professional image of Erlangga Shop and enables more efficient and targeted communication with potential customers. Future enhancements could include integrating online payment features, customer review systems, and personalized marketing based on user behaviour. Further research may explore the impact of such features on customer satisfaction and purchasing behaviour in the context of small to medium fashion businesses. In conclusion, the development of the Erlangga Shop website not only succeeds as an information and promotional tool but also contributes to strengthening brand identity and increasing sales opportunities in the increasingly digital market landscape.

Abstract

The growing adoption of e-wallet applications has significantly transformed online shopping habits, especially among Generation Z. This generation, known for its high level digital literacy, often chooses digital payment methods for convenience and speed. Previous studies have shown that financial technology tools can influence consumer behavior, but limited research focuses specifically on e-wallet usage among young users in developing countries. This study aims to analyze the impact of e-wallet use on changes in online shopping habits among Generation Z in Medan, Indonesia. A quantitative descriptive method was employed, using a simple linear regression technique to analyze data collected from 110 respondents. The results show that e-wallet usage has a positive and significant impact on changes in online shopping habits, with a contribution rate of 51.5%. Key factors driving this behavior include convenience, transaction efficiency, and perceived security. However, the findings also reveal potential risks such as impulsive buying behavior and increased digital dependence. In conclusion, this research highlights the dual role of e-wallets: as facilitators of modern consumer convenience and as tools that may encourage overconsumption. The study recommends responsible usage among youth, improved digital marketing strategies by business actors, and enhanced financial literacy education promoted by app developers.
Keywords: E-wallet applications; Online shopping habits; Generation Z; Consumer behavior.

1. Introduction

The development of human culture evolves every year, creating new behaviors and adaptations in how individuals or groups interact with their environment. As time progresses, technology plays an increasingly crucial role in shaping these adaptations. Users of modern technology must be able to adjust to rapidly changing human behavior patterns. As social beings, humans experience satisfaction through interactions, including in their roles as consumers. According to Kotler and Keller (Lilis Cucu S & Dini Fajriany A.T., 2019), customer satisfaction is defined as the level of feeling resulting from comparing expectations with actual outcomes in consumption. In a digital economy, one such technological advancement is the use of e-wallets, which provide seamless payment options without the need for physical cash (Megadewandanu et al., 2016).

One of the leading marketplace platforms in Indonesia today is Shopee. According to Chris Feng, CEO of Shopee, the platform is among many that have capitalized on the E-Commerce boom by innovating in mobile shopping. Shopee's social commerce approach resonates particularly in Southeast Asia, where social media usage is high, especially in Indonesia (Namira Shafinazh, 2020).

As digital technology evolves, human interaction and transaction behavior also shift to accommodate technological progress. This change is particularly visible in how younger

generations adopt and adapt to digital services, especially those that enhance convenience and speed in daily routines. These digital transformations affect not only individual lifestyles but also the broader consumer culture in Indonesia.

Generation Z, those born in the digital era, are the most familiar with the use of smartphones, internet-based applications, and financial technology services. As noted by (Alfira Dwi Astuti & Ani Fauziah (2023), their interaction with mobile devices, gadgets, and platforms forms a significant part of their daily lives, shaping both their social behaviors and economic choices. One prominent example is Shopee, a leading e-commerce platform in Southeast Asia. Chris Feng, Shopee's CEO, emphasized the company's role in leveraging mobile-based commerce, particularly in Indonesia where users are highly active on social media (Namira Shafinazh, 2020). The popularity of Shopee illustrates how digital platforms have reshaped the way people engage in buying and selling.

E-wallets, as part of financial technology (fintech), provide an effective alternative to cash payments, enabling consumers to perform transactions efficiently and securely. Megadewandanu et al. (2016) defined e-wallets as digital payment tools that facilitate transactions through mobile devices without the need for physical money. The COVID-19 pandemic further accelerated the shift toward digital payments. Although initially arising globally, its impact was significantly felt in Indonesia as people adopted e-wallets to reduce physical contact and prevent virus transmission (Anastasia & Nugroho, 2024). As a result, the digital economy experienced a surge, particularly in urban and youth populations.
According to a report by IPSOS, a global market research firm, 68% of active e-wallet users in Indonesia belong to Generation Z. These users conduct digital transactions at least twice a week, indicating a high frequency of engagement and reliance on cashless systems (Publicis Sapient, 2024). This growing trend raises questions about behavioral shifts and financial decision-making patterns among digital-native consumers.

E-wallets, also known as mobile wallets, are digital payment services operated under financial regulations and conducted via mobile devices. They are considered a new form of m-commerce that enables users to perform various transactions, including online shopping, bookings, and service payments (Sharma, S.K., Gaur, A., Saddikuti, V., & Rastogi, A., 2017). In today's digital era, many businesses are competing to offer convenience in online transactions. These services range from bill payments, online credit, ticket reservations, online loans, online shopping, and e-banking. All of these can be accessed through e-wallet applications such as DANA, OVO, GoPay, and ShopeePay, which are widely used by people, including in rural areas like Pekalongan. The widespread adoption of e-wallets has provided users with various conveniences and served as a bridge for the transition from manual to digital, internet-based transactions.

From an Islamic perspective, non-cash transactions are permissible as long as they fulfill specific conditions and are used for legitimate purposes, such as in debt or credit agreements. According to Islamic legal principles (fiqh), all types of muamalah (transactions) are considered permissible unless there is a clear prohibition. Based on this, the use of non-cash transactions is allowed under Islamic law, as supported by DSN-MUI Fatwa No.54/DSN-MUI/X/2006.

The table below shows the development of the use of various payment methods in Indonesia over the period 2020 to 2025. This data illustrates the shifting trend from traditional payment methods, such as cash and credit cards, to more practical and efficient digital methods, such as e-wallets, QRIS, and PayLater/BNPL. This significant increase in digital methods reflects technological advancements as well as changing consumer preferences in making transactions.

Table 1. Trending payment methods 2020 - 2025

Payment Method	2020	2021	2022	2023	2024	2025
E-Wallet (GoPay, OVO, DANA, ShopeePay)	65%	72%	80%	87%	92%	94%
QRIS (Integrated QR Code)	30%	38%	45%	52%	60%	68%
PayLater / BNPL (Buy Now Pay Later)	12%	18%	24%	31%	38%	46%
Debit Card	55%	53%	50%	47%	44%	40%
Payment Method	2020	2021	2022	2023	2024	2025
Credit Card	20%	18%	16%	14%	12%	10%
Cash	40%	35%	28%	22%	15%	7%

Based on the table shown above, it can be seen that digital payments or e-wallets are becoming the dominant payment method among Gen Z, with a significant increase from 65% in 2020 to 94% in 2025, which even beat the bank transfer or virtual account method used by generation Z.

Table 2. E-Wallets that are often used

Rating	E-Wallet	Usage Rate (%)
1	GoPay	88%
2	OVO	79%
3	ShopeePay	77%
4	FUNDS	71%
5	LinkAja	48%

The explanation of table 1.2. shows that GoPay digital wallet or e-wallet leads as the most popular e-wallet among Gen Z, thanks to its collaboration with the Gojek ecosystem and attractive features such as GoPayLater. Changes in the consumption behavior of generation Z are driven by the advancement of information and communication technology which triggers a higher level of consumption in generation Z because it makes it easy to find information related to products that are needed in a fast time and in a scope that has no limitations. Because generation Z always maintains their appearance to always exist and generally likes to be tempted by various kinds of attractive advertisements, especially supported by advances in internet technology which offers several application features by providing easy access to shopping (Fadhilah, 2023).

The main factor influencing Generation Z's consumptive behavior is the use of online shopping applications. Online shopping is defined as the activity of buying or selling products and services through internet-based platforms. Consumers can easily identify and evaluate products via photos and videos provided on these apps. Popular platforms used include Shopee, Lazada, Tokopedia, Bukalapak, and others. Generation Z tends to use online shopping applications to satisfy wants rather than needs (Fadhilah, 2023).

A Digital Wallet, or E-Wallet, refers to a financial technology application that enables users to store, manage, and conduct financial transactions digitally using internet-connected devices such as smartphones, tablets, or computers. E-Wallets are part of the broader evolution of FinTech (Financial Technology) that has transformed how individuals interact with their finances. According to Somantri (2024), "Electronic wallets are software applications or platforms that allow users to securely store and manage their payment information." These platforms are typically equipped with features such as QR code payments, integration with online marketplaces, digital receipts, and even micro-investment or bill payment systems.

Furthermore, Megadewandanu, Suyoto, and Pranowo (2016) explain that digital wallets can be categorized into open, semi-closed, and closed systems, depending on the transaction

scope and the level of integration with external financial institutions. Open e-wallets, for instance, allow full interoperability between banks, merchants, and users. Semi-closed wallets are accepted by specific partners, while closed wallets are restricted to specific platforms or merchants only.

Digital wallets are not just a replacement for physical cash but also function as financial management tools. As highlighted by Sharma et al. (2017), e-wallets encourage financial inclusion by making transactions faster, safer, and accessible for younger users, particularly in emerging economies. Features such as low transaction costs, reward systems, and user-friendly interfaces have made e-wallets increasingly popular among digital-native generations.
Key characteristics of digital wallets include:

i. Mobility: Access anytime via mobile apps
ii. Security: Encrypted transactions and biometric authentication
iii. Integration: Compatible with e-commerce platforms, transportation apps, and more
iv. Efficiency: Reduces the need for physical cash handling
v. Transaction History: Provides digital receipts and spending summaries.

According to Bank Indonesia (2023), e-wallet usage in Indonesia has risen significantly post-pandemic, driven by government support for cashless economies and increased consumer trust in digital systems.

From a behavioral economics perspective, e-wallets can subtly influence consumer habits. The reduction of friction in spending (e.g., just tapping to pay) can lead to increased impulsive purchases, especially among youth segments (Alfira & Faujiah, 2023). This makes financial literacy education critical alongside technological adoption. In conclusion, digital wallets represent not just a payment method but also a convergence point between technology, finance, and lifestyle. Their integration into everyday life reflects the growing reliance on digital tools for personal and commercial finance.

2. Methodology

This study employs a descriptive quantitative method with a simple linear regression analysis to examine the impact of e-wallet usage on the online shopping behavior of Generation Z in Medan, Indonesia. The research was conducted from April to June 2025, focusing on young individuals who live in or frequently visit the Wahid Hasyim area.

According to Sugiyono (as cited in Roflin, 2021), population refers to a generalization area that consists of objects or subjects with certain qualities and characteristics defined by the researcher to be studied and from which conclusions are drawn. In this study, the population includes customers and visitors in the Wahid Hasyim area, including those at Restaurant Kodagu, Café Habitat, Ucok Durian, local residents, and other frequent visitors. The research focuses specifically on individuals from Generation Z who are active users of e-wallet applications and who engage in online shopping activities within the region.

The sample was selected using purposive sampling, a non-probability sampling method where respondents are chosen based on specific criteria defined by the researcher (Sugiyono, 2017).
The criteria used were as follows:

i. 17. Belong to Generation Z (born between 1997 and 2012)
ii. 18. Have used an e-wallet to make a payment at least once in the last three months
iii. 19. Possess a sufficient understanding of how to use e-wallet services

A sample is a subset of the population. According to Sugiyono (2017), a good sample must give every unit in the population a fair chance to be selected and must be large enough to accurately represent the population characteristics.

In this study, a total of 110 respondents were selected as the research sample. They consist of both residents and visitors to the Wahid Hasyim area, including individuals found in popular public locations such as Restaurant Kodagu, Café Habitat, and Ucok Durian.

The population includes individuals classified as Generation Z (born between 1997 and 2012) who actively use e-wallet services and participate in online shopping activities. Using the Slovin formula with a 5% margin of error, the minimum sample size was determined to be 110 respondents from a total population of 217.

$$n = \frac{N}{1+N(e^2)} \quad (1)$$

$$where\ (N\ =\ 217)\ and\ (e\ =\ 0.05), giving\ (n\ \approx 110)$$

The data were collected through a structured questionnaire distributed to respondents via a direct approach. The questionnaire consisted of closed-ended Likert-scale questions.

3. Results and discussion

In this study, researchers used IBM SPSS Statistics 25 as a tool to analyze validity and reliability tests. Based on the calculation results, the calculated r value for all items exceeds the r table value, so that all instrument items in this study are declared valid. In addition, the reliability test results show that the Cronbach's Alpha value is more than 0.70, which means that each statement in the questionnaire has a good level of consistency and is suitable for use in this study. All variable question items (X1), (X2), (Y) are declared valid r count is greater than 0.361. Descriptive Analysis Descriptive statistics are used to provide an overview of respondents' responses to the variables studied, namely the impact of using the E-Wallet application (X1), and changes in online shopping habits (Y).

Table 3. Characteristics of Respondents Based on Age

Frequency	Percent
17 - 25 Years	75
26 - 35 Years	28
> 35 Years	7
Total	110

It is concluded that Generation Z who uses the E-Wallet application in Medan Baru District is

Table 4. Characteristics of Respondents Based on Gender

Frequency	Percent
Male	49
Female	61

It can be concluded that the majority of E-Wallet Apps are male-dominated.

Table 5. Characteristics of Respondents Based on Occupation

Frequency	Percent
HIGH SCHOOL/VOCATIONAL SCHOOL	66
Diploma	12
S1	32

This shows that the majority of the use of E-Wallet student applications is 66%

Table 6. Characteristics of Respondents Based on Purchase Frequency

Frequency	Percent
Yes	106
No	4
Total	110

Multiple linear regression is applied to determine the extent to which the independent variable, the impact of using the E-Wallet application (X1), influences the dependent variable, changes in online shopping habits (Y). Based on Table 3, the linear regression equation is:

$$Y= 9.182+ 0.456\ X1+ 0.482\ X2 \quad (2)$$

Table 4. Multiple Linear Regression Analysis Results

Unstandardized Coefficients		Standardized Coefficients	t	Sig.
B	Std. Error	Beta		
9.182	4.610		-1.992	0.049
0.456	0.084	0.464	5.419	0.000
0.482	0.101	0.407	4.745	0.000

Based on the regression equation obtained, it can be described as follows:
The constant (β_0) = 4.425 indicates that if the variable Impact of Using the E-Wallet Application (X_1) is zero, then the level of Change in Online Shopping Habits (Y) on the E-Wallet Application in Medan Baru District is estimated at 4.425, assuming no influence from other variables.

4. Conclusion

This research confirms that the usage of e-wallet applications significantly affects changes in online shopping habits among Generation Z in Medan. Based on the regression analysis, e-wallet usage positively influences online shopping activity, with an influence of 51.5%. Several factors—such as transaction speed, convenience, ease of use, and promotional features—were identified as drivers of frequent e-wallet use. However, the increased convenience also carries risks, such as impulsive buying, reduced financial discipline, and greater dependence on digital systems. Recommendations:

i. For users: Practice self-control and responsible usage of e-wallets to avoid overspending.
ii. For developers: Incorporate financial literacy features and tools that help users monitor their spending behavior.
iii. For businesses: Use e-wallets in marketing strategies to increase transaction efficiency and improve customer experience.
iv. For future researchers: Extend this study by including other demographic groups or testing moderating variables such as financial literacy or digital lifestyle.

THE INFLUENCE OF VIRAL MARKETING AND FEAR OF MISSING OUT (FOMO) ON IMPULSIVE BUYING ON E-COMMERCE PLATFORMS (TIKTOK SHOP)

Ratu Valana Dewi, Riandani Rezki Prana*

Management Study Program, Sukma College of Management, 20219 Medan, North Sumatra, Indonesia

*Corresponding author e-mail address: ratuvalanadewi@gmail.com

Abstract

This study examines the influence of Viral Marketing and Fear of Missing Out (FOMO) on Impulsive Buying behavior on the TikTok Shop e-commerce platform. The research population consists of university students classified as part of Generation Z from the 2021 intake in Medan A quantitative research method was employed, using a survey approach through questionnaires distributed to 47 respondents. Data were analyzed using multiple linear regression with the assistance of SPSS software. The findings indicate that both Viral Marketing and FOMO have a statistically significant effect on Impulsive Buying behavior, both partially and simultaneously. The regression coefficient for Viral Marketing is 0.426 (significant at p = 0.031), while the coefficient for FOMO is 0.760 (significant at p = 0.000), indicating that FOMO is the more dominant factor. The coefficient of determination (R^2) is 0.496, which means that 49.6% of the variation in impulsive buying behavior can be explained by these two independent variables. These results underscore that viral content and the creation of a sense of urgency through FOMO are effective in stimulating impulsive purchasing behavior among young consumers. Therefore, understanding consumer psychology is essential in developing effective digital marketing strategies.
Keywords: Marketing; FOMO; Impulsive.

1. Introduction

The digital era has significantly transformed consumer behavior, particularly with the increasing prevalence of online shopping through e-commerce platforms such as TikTok Shop. Originally known for short video content, TikTok has evolved into a popular e-commerce platform among younger generations due to its ease of access, diverse product offerings, and interactive shopping experience. In a competitive business environment, companies are required to be more creative in promoting their products, and viral marketing has proven to be an effective strategy. By leveraging social networks and user interaction, viral marketing enables rapid dissemination of promotional messages. Content marketing strongly influences impulse buying behavior on TikTok Shop [1]. In addition, Fear of Missing Out (FOMO)—a psychological phenomenon describing the fear of missing opportunities or experiences—has also shown a significant impact on impulsive buying behavior, especially in TikTok Shop purchase [2] [3]. FOMO can drive consumers to make spontaneous purchases when observing peers or influencers buying trending products. The integration of viral marketing with e-commerce platforms like TikTok Shop creates a powerful synergy in triggering impulse buying behavior, [4], [5], where viral videos easily spark FOMO. Features like live streaming further amplify this effect by creating urgency to purchase before missing out on limited time offers. This phenomenon illustrates how digital platforms have reshaped consumer purchasing patterns, making it essential for companies to innovate and understand psychological drivers in order to succeed in today's competitive market. In light of this phenomenon, this study aims to investigate whether viral marketing influences impulsive buying behavior on the TikTok Shop platform, whether FOMO affects impulsive buying behavior, and whether both factors simultaneously impact impulsive buying behavior among TikTok Shop users.

2. Methodology

This research was conducted at the Medan City, North Sumatra, within a timeframe from April to June 2025, with a total research duration of four months from initiation to completion. The research focuses on university students classified as part of Generation Z from the 2021 intake in Medan users of the TikTok Shop platform. This study adopts a quantitative approach with a structured questionnaire as the primary instrument, utilizing a Likert scale to measure the influence of viral marketing and Fear of Missing Out (FOMO) on impulsive buying behavior. Data collected were analyzed using multiple linear regression through the SPSS software to test the effects of the independent variables. The study employs both primary and secondary data; primary data were obtained directly through questionnaire distribution. The population consisted of 87 students, and the sample was determined using the Slovin formula with a 10% margin of error, resulting in a sample size of 47 respondents selected randomly. These respondents are considered to adequately represent the population in analyzing the relationship between viral marketing, FOMO, and impulsive buying behavior on TikTok Shop.

3. Results and discussion

Table 1. Gender

	Frequency	Percent	Valid Percent	Cumulative Percent
Laki-laki	5	10,6	10,6	10,6
Perempuan	42	89,4	89,4	100,0
Total	47	100,0	100,0	

Based on the data presented in the table above, it is evident that majority of respondents are female, comprising 89.4% of the total, whereas male respondents account for only 10.6%.

Table 2. Years of birth

Category	Frequency	Percent	Valid Percent	Cumulative Percent
1997-2000	5	10,6	10,6	10,6
2001-2004	42	89,4	89,4	100,0
Total	47	100,0	100,0	

Referring to the table above, it is also evident that respondents born between 2001 and 2004 constitute the dominant age group, accounting for 89.4% of the sample, while the remaining 10.6% were born between 1997 and 2000.

Table 3. Multiple Linear Regression Analysis

Model	Variable	B	Std. Error	Beta	t	Sig.
1	(Constant)	-8.719	8.052		-1.083	.285
	Viral Marketing	0.426	0.191	0.261	2.234	.031
	FOMO	0.76	0.159	0.559	4.787	<.001

Based on the results of the multiple linear regression analysis presented in the *Coefficients Table*, the regression equation is as follows:

$$\text{Impulsive Buying} = -8.719 + 0.426(\text{Viral Marketing}) + 0.760(\text{FOMO})$$

From the table above, the following interpretations can be made:

The constant value of -8.719 indicates that if both the Viral Marketing and FOMO variables are equal to zero, the predicted value of Impulsive Buying is -8.719. However, this constant is

not statistically significant (Sig. = 0.285 > 0.05), and thus does not have a meaningful independent effect. The Viral Marketing variable has a regression coefficient of 0.426, which means that for every one-unit increase in Viral Marketing, Impulsive Buying increases by 0.426 units, assuming other variables remain constant. The significance value of 0.031 (< 0.05) indicates that this variable has a statistically significant effect on Impulsive Buying. The FOMO variable has a regression coefficient of 0.760, indicating that a one-unit increase in FOMO results in a 0.760 unit increase in Impulsive Buying, assuming other variables remain constant. The significance value of 0.000 (< 0.05) confirms that FOMO has a statistically significant effect on Impulsive Buying. Moreover, this variable has the highest Beta value (0.559), suggesting that FOMO is the most dominant factor influencing impulsive buying behavior.

Table 4. R Square

Model	R	R Square	Adjusted R Square	Std. Error of the Estimate
1	0.704	0.496	0.473	4.14014

Based on the Model Summary table, the correlation coefficient (R) is 0.704, indicating a strong relationship between the independent variables (FOMO and Viral Marketing) and the dependent variable (Impulsive Buying). The coefficient of determination (R Square) is 0.496, suggesting that 49.6% of the variance in Impulsive Buying can be explained by the variables FOMO and Viral Marketing. Meanwhile, the remaining 50.4% is attributable to factors outside the scope of this research model. The Adjusted R Square value of 0.473 accounts for the number of variables in the model and reflects the degree of model adjustment to the data.

Table 5. F Table

Model	Source	Sum of Squares	df	Mean Square	F	Sig.
1	Regression	742.657	2	371.329	21.663	<.001
	Residual	754.194	44	17.141		
	Total	1496.851	46			

The ANOVA results indicate that the regression model is statistically significant. This is evidenced by the F-value of 21.663 and a significance level (Sig.) of <0.001. Since the significance value is less than 0.05, it can be concluded that the regression model, including the variables FOMO and Viral Marketing, has a significant simultaneous effect on the Impulsive Buying variable.

Table 6. T-table

Model	Variable	B	Std. Error	Beta	t
1	(Constant)	-8.719	8.052		-1.083
	Viral Marketing	0.426	0.191	0.261	2.234
	FOMO	0.76	0.159	0.559	4.787

Based on the SPSS output, the t-test results show the following:

1. The Viral Marketing variable has a t-value (2.234) greater than the t-table value (2.03), indicating that this variable has a significant effect on Impulsive Buying.
2. The FOMO variable has a t-value (4.787) greater than the t-table value (2.03), suggesting that this variable also has a significant effect on Impulsive Buying.

The results of the study indicate that both independent variables, Viral Marketing and FOMO, have a highly significant effect on the dependent variable (Impulsive Buying). The Viral Marketing variable has a significant and positive effect on Impulsive Buying. This suggests that the greater the exposure consumers have to viral marketing, the higher the likelihood of engaging in impulsive buying behavior.

The FOMO (Fear of Missing Out) variable also has a significant effect on Impulsive Buying, with a more dominant influence compared to Viral Marketing. This means that the higher an individual's fear of missing out on trends or moments, the stronger their tendency to engage in impulsive purchases.

4. Conclusion

In conclusion, this study demonstrates that both Viral Marketing and Fear of Missing Out (FOMO) have a significant and positive impact on Impulsive Buying behavior. The findings suggest that social media-driven marketing strategies, combined with psychological factors such as FOMO, play a crucial role in influencing consumers' spontaneous purchasing decisions. Notably, FOMO exerts a more dominant effect than Viral Marketing, indicating the importance of addressing emotional and psychological triggers in marketing approaches. Therefore, understanding consumer behavior in the digital era requires not only innovative marketing techniques but also a strong grasp of the psychological aspects that drive impulse purchases.

Abstract

This study aims to determine the effect of experiential marketing and emotional branding on customer loyalty at PT Cahaya Bintang Holidays. The research is grounded in the importance of creating memorable experiences and emotional connections to retain customer loyalty in the competitive tourism industry. A quantitative approach was used, employing a survey method through questionnaires distributed to 60 respondents who are customers of PT Cahaya Bintang Holidays. Data analysis was conducted using multiple linear regression with the help of SPSS. The results show that experiential marketing has a positive and significant effect on customer loyalty, with a t-value of 2.901 and a significance level of 0.005. Emotional branding also has a positive and significant effect, with a t-value of 7.440 and a significance level of 0.000. Simultaneously, both variables significantly influence customer loyalty, as indicated by an F-value of 162.103 and a significance level of 0.000. Emotional branding was found to have a more dominant impact than experiential marketing. The coefficient of determination (R^2) is 0.850, indicating that 85% of the variation in customer loyalty can be explained by these two variables. These findings highlight the crucial role of emotional and experiential strategies in fostering customer loyalty.
Keywords: Experiential-marketing; Emotional-branding; Loyalty.

1. Introduction

People's lifestyles are now growing rapidly, resulting in progress and change in every industrial sector including the tourism industry. In the increasingly competitive tourism industry, travel companies as service providers must be able to create memorable experiences for customers in order to survive and grow. One strategy that can be used is experiential marketing, which is a marketing approach that emphasizes the customer's direct experience of the products or services offered (Detmuliati et al., 2023). The marketing concept that not only provides information and opportunities for customers to gain experience of the benefits obtained but also arouses emotions and feelings that have an impact on marketing, especially sales, is known as experiential marketing (Yuningsih et al., 2021). The existence of experiential marketing in a series of tourism service marketing helps travel to create a distinctive feature of its marketing strategy so that it becomes a differentiator from competing companies. In addition, emotional branding is also a component that plays an important role in building an emotional bond between a brand and a customer, when an emotional bond between a customer and a brand has been formed, it can ultimately increase customer loyalty to the brand. Emotional branding is a concept of forming a brand with an emotional nuance (Sutomo et al., 2024). In practice, companies must be able to create an emotional closeness between the brand and the customer. This emotional closeness can be in the form of a positive or negative assessment.

PT Cahaya Bintang Holidays is a travel company operating in Medan, providing various travel services, both domestic and international, hotel reservations, tours and tourism accommodation rentals. In an era of increasingly competitive business competition, customer loyalty is a crucial element that determines the sustainability and growth of a company, including in the tourism services industry. PT Cahaya Bintang Holidays, as a travel service

provider, is required to continue to present memorable experiences and build strong emotional relationships with its customers. Two approaches that are now widely used in modern marketing strategies are experiential marketing and emotional branding, both of which play an important role in creating sustainable customer loyalty.

Meanwhile, emotional branding is a strategy to build emotional attachment between customers and brands. This approach creates a personal relationship that goes beyond the basic function of the product, through elements such as trust, emotional closeness, and touching brand stories. When customers feel emotionally connected, brand loyalty will grow stronger and be resistant to temptation from competitors. This study focuses on how experiential marketing and emotional branding affect customer loyalty of PT Cahaya Bintang Holidays. The formulation of the problems raised includes how experiential marketing affects customer loyalty, how emotional branding affects customer loyalty, and to what extent the two variables together affect loyalty. This study is limited to customers who have used the services of PT Cahaya Bintang Holidays and only includes two independent variables: experiential marketing and emotional branding. Theoretically, this research is expected to enrich studies in the field of marketing, especially regarding strategies for building customer loyalty based on experience and emotion. Practically, the results of this study can be used by PT Cahaya Bintang Holidays and other travel service companies as a basis for designing more effective marketing strategies in creating long-term loyalty.

2. Methodology

This study was conducted on individuals who had used PT Cahaya Bintang Holidays Travel services in April–June 2025 in Medan City and its surroundings. The variables observed in this study consisted of independent variables in this study were experiential marketing and emotional branding, while the dependent variable was customer loyalty. This study used a quantitative approach with a questionnaire survey method. Primary data were collected by distributing online questionnaires (Google Form) to 60 respondents who were customers of PT Cahaya Bintang Holidays. The sampling technique used was purposive sampling, namely by selecting respondents who had used the company's services. Each variable was measured using relevant indicators, such as sense, feel, think, act, relate for experiential marketing; trust, attachment, storytelling for emotional branding; and repeat purchases, recommendations, brand loyalty for customer loyalty. The data processing of this study was done using multiple linear regression analysis using SPSS statistical software.

3. Results and Discussion

Respondent characteristics are the identities of the research participants. In this study, the sample consisted of 60 people who could be identified based on age, occupation and level of education.

Table 1. Respondent characteristics based on age

No	Age	Amount
1	15 - 25 years	31
2	26 - 35 years	14
3	36 - 45 years	13
4	46 - 55 years	0
5	> 55 years	2
Total	60	

From the table above, it can be seen that the largest number of respondents is in the 15-25 year age group, as many as 31 people, this is because individuals in this age range tend to still be active and have a lot of energy to explore the world, see new things and do physical activities, one of which is traveling and vacationing, this is what makes individuals from this

age range the dominant respondents in this study. Furthermore, the second largest number of respondents is occupied by individuals in the 26 to35 year age range. Followed by individuals in the 36-to-45-year age range. The fewest respondents are individuals in the age range over 55 years as many as 2 people, this is because individuals at this age are categorized as parents or elderly people who mostly no longer have the ability to travel or vacation due to health problems. Most of them have stayed at home enjoying their old age peacefully with their families.

Table 2. Respondent characteristics based on occupation

No	Work	Amount
1	Pharmacist	2
2	Assistant	1
3	Asn	1
4	Chef	2
5	Lecturer	2
6	Teacher	10
7	Employee/ Staff	9
8	Cashier	2
9	Chairman of the committee	1
10	Contractor	1
11	Student	12
12	Manager	1
13	Marketing	1
14	Waiter	3
15	Self-employed	4
16	Businessman	7
17	Seamstress	1
	Total	60

The table above shows the professions of the respondents who have filled out the questionnaire for this study, based on the data it can be seen that the largest number of respondents are those who are students, namely 12 people, this is most likely due to the high activity of students so that they tend to be bored and need healing or refreshment by traveling or vacationing. Furthermore, the second largest number of users of travel services are those who work as teachers, namely 10 people and followed by other professions.

Table 3. Respondent characteristics based on gender

No	Gender	Amount
1	Man	23
2	Woman	37
	Total	60

From the table above, it can be seen that the number of respondents who provided data for this study was more from women, 37 people. While men were only 23 people. In other words, the majority of users of PT Cahaya Bintang Holidays travel services are women. These data show that, in practice, women vacation and travel more often than men do. The research results will be valid if the collected data are similar to the actual data observed in the object being studied. A valid instrument is one that is used to obtain the data. A valid instrument will be obtained if r_{count} is bigger than or equal to r_{table}, and is not valid if the r_{count} is smaller than or equal to r_{table}.

A reliable instrument is an instrument that, if used several times to measure the same object, will obtain the same data. A rubber measuring instrument is an example of a non-reliable instrument (Priadana & Sugiono, 2021). If the Crombach alpha value is 0.6, the research instrument is reliable and if the Crombach alpha value is 0.6, it is not reliable.

Table 4. Results of the experiential marketing validity test

Instrument	Validity Value		Conclusion
	r_{count}	r_{table}	
Experiential Marketing 1	0.759		Valid
Experiential Marketing 2	0.816		Valid
Experiential Marketing 3	0.809	0.2542	Valid
Experiential Marketing 4	0.872		Valid
Experiential Marketing 5	0.785		Valid

From the table above, the r value can be seen$_{count}$ for the experiential marketing variable in statements 1 to 5 the value is < r_{table}0.2542 then it can be concluded that the statement on this variable is declared valid. In other words, the list of statements in this questionnaire is filled consistently from time to time.

Table 5. Results of the validity test of emotional branding variables

Instrument	Validity Value		Conclusion
	rcount	r_{table}	
Emotional branding 1	0.872		Valid
Emotional branding 2	0.842		Valid
Emotional branding 3	0.855	0.2542	Valid
Emotional branding 4	0.799		Valid
Emotional branding 5	0.800		Valid

From the table above, the r value can be seen$_{count}$ for the emotional branding variable in statements 1 to 5 the value is < r_{table}0.2542 then it can be concluded that the statement on this variable is declared valid. In other words, the list of statements in this questionnaire is filled consistently from time to time.

Table 6. Results of the validity test of customer loyalty variables

Instrument	Validity Value		Conclusion
	r_{count}	r_{table}	
Customer Loyalty 1	0.866		Valid
Customer Loyalty 2	0.810		Valid
Customer Loyalty 3	0.838	0.2542	Valid
Customer Loyalty 4	0.799		Valid
Customer Loyalty 5	0.824		Valid

From the table of results of the customer loyalty validity test, it is known that the r value$_{count}$ in statements 1 to 5 the value is < r_{table}0.2542 then it can be concluded that the statement on this variable is declared valid. In other words, the list of statements in this questionnaire is filled consistently from time to time.

Table 7. Reliability test results for all variables

Cronbach's Alpha	N of Items
0.953	15

The research is declared reliable if the Cronbach's alpha value is > 0.6 based on the reliability test results table above. Because Cronbach's alpha value is 0.895, the research instrument is declared reliable, or its authenticity can be believed. This test was conducted to determine the effect of experiential marketing and emotional branding on customer loyalty of PT Cahaya

Bintang Holidays. The following is a table of the results of multiple linear regression tests on each variable, namely:

Table 8. Results of multiple linear regression tests

	Unstandardized Coefficients		Standardized Coefficients		
	B	Std. Error	Beta	t	Sig.
(Constant)	1.665	1.236		1.346	0.184
Experiential Marketing	0.268	0.092	0.268	2.901	0.005
Emotional Branding	0.668	0.09	0.687	7.44	0

Based on the test results above, the following multiple linear regression equation is obtained:

$$Y= 1.665 + 0.268\ X_1 + 0.668\ X_2 \quad (1)$$

In the multiple linear regression model, the customer loyalty constant value is 1.665, meaning that if the value of the independent variables, experiential marketing and emotional branding, is 0, then the dependent variable purchasing decision is 1.665 units. The coefficient of each independent variable is positive, meaning that customer loyalty of PT Cahaya Bintang Holidays can be influenced by experiential marketing and emotional branding.

Table 9. Results of determination coefficient test

Model	R	R Square	Adjusted R Square	Std. Error of the Estimate
1	0.922	0.85	0.845	0.84312

The coefficient of determination value obtained was 0.850 (85%), indicating that experiential marketing and emotional branding were able to explain the variation in customer loyalty at PT Cahaya Bintang Holidays, while the remaining 15% was explained by other variables not examined in this study.

Table 10. Simultaneous test results

Model	Sum of Squares	df	Mean Square	F	Sig.
Regression	230.464	2	115.232	162.103	.000[b]
Residual	40.519	57	0.711		
Total	270.983	59			

Based on the table above, it can be seen that the F value$_{count}$ 162.103 > from F value$_{table}$ which is 3.16 and significance 0.000 < alpha 0.05. So, the decision taken is H_0rejected H_1accepted, thus experiential marketing and emotional branding have a positive and significant influence on customer loyalty at PT Cahaya Bintang Holidays.

Table 11. Partial test results

		Understandardized Coefficients		Standardized Coefficients		
	Model	B	Std. Error	Beta	t	Sig.
1	(Constant)	1.665	1.236		1.346	0.184
	Experiential_marketing	0.268	0.092	0.268	2.901	0.005
	Emotional_Branding	0.668	0.09	0.687	7.44	0.000

Based on the table above, it can be seen that:

a. t value $_{count}$ for experiential marketing variable 2.901 > t_{table} 1.671 and a significant value of 0.005 < 0.05 (5%), then H_0 says H_1 accepted, thus experiential marketing has a partial effect on customer loyalty at PT Cahaya Bintang Holidays.
b. t value $_{count}$ variable emotional branding 7.440 > t_{table} 1.671 and a significance value of 0.000 < alpha 0.05 (5%), then H_0 rejected and H_1 accepted, thus partially emotional branding has a positive and significant influence on customer loyalty at PT Cahaya Bintang Holidays.

4. Conclusion

Based on the results of the research that has been conducted, it can be concluded that experiential marketing and emotional branding have a positive and significant effect on customer loyalty of PT Cahaya Bintang Holidays. A pleasant, interesting, and memorable experience can form a positive impression that encourages customers to remain loyal, while emotional branding creates a strong emotional bond through a sense of trust, security, and personal closeness. Simultaneously, these two variables contribute greatly to the formation of customer loyalty, with emotional branding having a more dominant influence. This finding confirms that in the tourism industry, the combination of memorable experiences and strong emotional bonds is a key factor in building long-term loyalty.

THE INFLUENCE OF TRUST LEVEL AND SHOPEE PAYLATER FACILITIES ON GEN Z STUDENTS' PURCHASE DECISIONS

Wulan Fitri Nasution*, Sixson Roberto Simangunsong

Tourism Management, Sukma College of Management, 20219 Medan City, North Sumatera, Indonesia

*Corresponding author e-mail address: nstwln200817@gmail.com

Abstract

This study aims to investigate the influence of trust and the Shopee PayLater service on purchasing decisions among Generation Z university students. With the rapid advancement of information and communication technologies, Generation Z, known for their active engagement with digital platforms, tends to favor payment methods that are both efficient and convenient, such as Shopee PayLater. The research adopts a quantitative approach by distributing questionnaires to university students. The analytical techniques employed include t-tests, F tests, multiple linear regression analysis, residual tests, and the coefficient of determination test. The collected data are analyzed using multiple linear regression to examine the relationships among the variables. The findings reveal that the level of trust yields a statistically significant t-value, indicating a positive and significant impact on purchasing decisions. Similarly, the Shopee PayLater feature also demonstrates a significant t-value, suggesting it has a favorable and substantial influence on purchase choices among Generation Z students.
Keywords: Trust-Level; Shopee-Features; Purchasing-Decision.

1. Introduction

Shopee has emerged as a well-established e-commerce platform, particularly popular among members of Generation Z. Through Shopee, buying and selling processes are streamlined and user-friendly. The rapid evolution of information and communication technologies has transformed the way consumers engage with goods and services, especially within the e-commerce landscape. Generation Z, defined as individuals born between 1997 and 2012 is widely recognized for its deep integration with digital technology and a strong preference for online shopping. This generation tends to opt for simple and efficient payment solutions, such as the “PayLater” feature offered by platforms like Shopee.

According to Indonesia’s Ministry of Communication and Information Technology (Kominfo, 2021), the PayLater payment system presents significant potential as an alternative to conventional credit, especially considering the stagnation in credit card adoption, particularly among lower- to middle-income groups. Both Millennials and Generation Z display high tendencies toward purchasing digital products. Furthermore, activating PayLater features is significantly more straightforward in terms of requirements and application processes when compared to credit cards. Although PayLater services often charge higher interest rates, many consumers still prefer them due to the speed of the transaction process and the added security regulated by the Financial Services Authority (OJK). Nevertheless, there is growing concern that consumers may engage in impulsive spending without fully considering their financial capabilities and readiness.

Trust refers to the perception individuals hold toward their surroundings. It is shaped by personal experience, perspective, and evaluation, all of which influence how individuals perceive brands and products. When consumers place their trust in Shopee, they are more inclined to use Shopee PayLater as a preferred method for online transactions. This

widespread consumer confidence has contributed to Shopee's position as one of the most frequently used marketplaces, boasting a higher transaction rate than its competitors. This trust can be observed in users' belief in the services and products offered by Shopee, even in the face of potential risks, as they expect to receive satisfactory outcomes. Trust also plays a critical role in the decision-making process when choosing to use Shopee PayLater (Gratia et al., 2022) (Saputra & Sudarwanto, 2023)

Perceived ease of technology use is another factor influencing trust. It refers to an individual's belief in the effectiveness of a system to support task completion. This concept is tied to a system's ability to enhance users' efficiency. The accessibility and user-friendliness of digital loan applications, such as Shopee PayLater, enable users to make quick, well-informed decisions. Ease of use, therefore, is also a measure of how confident individuals feel that the technology will perform reliably and support their tasks effectively (Saputra & Sudarwanto, 2023).

According to (Ningsih Wijaya et al., 2024) purchasing decisions represent a crucial phase in the buying process that precedes post-purchase behavior. At this stage, consumers evaluate multiple options and eventually decide whether to proceed with a purchase based on their assessments. The purchasing decision, therefore, reflects an effort to solve a perceived problem or to achieve a goal in a cost-effective and timely manner.

Generation Z university students exhibit distinct behavioral and consumption patterns. Many face financial management challenges, making alternative payment methods like Shopee PayLater appealing. However, studies that deeply explore the influence of trust and perceived ease of use of Shopee PayLater on purchasing decisions among students remain limited. Thus, this research is essential for understanding the relationship between trust, ease of use, and purchasing decisions among Generation Z university students.

2. Methodology

This research was conducted by distributing questionnaires to university students belonging to Generation Z, specifically those aged between 18 and 23 years. The majority of the targeted respondents were students who actively utilized the Shopee application. These individuals frequently engage in online shopping through Shopee and commonly conduct transactions using the Shopee PayLater feature. This research was conducted for five months, from February to June 2025.

Table 1. Research Schedule

No	Activities	Month				
		February	March	April	May	June
1	Title submission					
2	Research proposal writing					
3	Research permit application					
4	Research implementation					
5	Thesis writing					
6	Thesis guidance					
7	Publish					

The type of data used in this study is quantitative data derived from primary data, namely data obtained directly from respondents, by distributing questionnaires to Gen Z students utilizing or using Shopee Paylater services. The goal is to measure and statistically analyze the impact of the level of trust and Shopee Paylater facilities on purchasing decisions. This research is also supported by secondary data, taken from literature, journals, and relevant previous research to strengthen the theoretical basis and conceptual framework of this study.

The data collection method used in this study was quantitative, using a questionnaire. The questionnaire was designed to gather data on the influence of trust and ease of use of ShopeePay Later on purchasing decisions among Generation Z. This questionnaire was distributed to Gen Z students to obtain relevant and numerically measurable information. In addition to descriptive analysis, this study incorporated hypothesis testing using several statistical methods, including the t-test, F-test, coefficient of determination (R^2), multiple linear regression, and residual analysis of the questionnaire responses.

3. Results and discussion

The characteristics of the respondents refer to the demographic and identity-related data of the individuals who participated in this study. The selected respondents were Generation Z university students aged 18 to 23. A total of 33 of the 100 distributed questionnaires were completed and returned by participants, and the sample was categorized by current semester of study. The demographic profile of the respondents is described in detail below:

Table 2. Respondent's identity

Number	Level	People
1.	2	14
2.	4	10
3.	6	16
4.	8	60
Total		100

This analysis was conducted to examine the influence of trust and the ease of use of Shopee on the purchasing decisions of Generation Z university students. The results of the multiple linear regression analysis for each variable are presented below:

Table 3. Multiple Linear Regression Test Results

Model		Unstandardized coefficients		Standardized coefficient	t	Sig.
		B	Std. Error	Beta		
1	(Constant)	8.357	2.054		4.068	0
	tingkat kepercayaan	0.436	0.102	0.509	4.283	0
	fasilitas shopee	0.355	0.118	0.358	3.01	0.003

Based on the regression analysis presented above, the multiple linear regression equation is formulated as follows:

$$Y = 8.357 + 0.436X_1 + 0.355X_2 \quad (1)$$

In this regression model, the constant value for the purchasing decision variable (Y) is 8.357. This indicates that if the independent variables—X_1 (trust level) and X_2 (Shopee features)—are both equal to zero, the predicted value of the dependent variable (purchasing decision) would be 8.357. The positive regression coefficients for both independent variables suggest that the purchasing decisions made through Shopee PayLater are positively influenced by the level of trust and the features provided by the Shopee platform.

Before proceeding with the multiple linear regression analysis, a normality test was conducted on the residual data to ensure that one of the key assumptions of regression was satisfied—namely, that the residuals are normally distributed. The normality test was performed using the One-Sample Kolmogorov-Smirnov Test. The results of this analysis are presented in the following table:

Table 4. Residual Test

N		100
Normal Parameters	Mean	0.0000000
	Std. Deviation	3.98007564
Most Extreme Differences	Absolute	0.078
	Positive	0.078
	Negative	-0.051
Test Statistic		0.078
Asymp. Sig. (2-tailed)		0.134

The table above presents the results of the normality test conducted using the One-Sample Kolmogorov-Smirnov test on the regression residuals, based on a sample of 100 respondents. The residual mean is 0, with a standard deviation of 3.980, indicating that the residuals are centered around zero—as expected in a well-fitted regression model. The Kolmogorov-Smirnov test statistic is 0.078, with an asymptotic significance value (2-tailed) of 0.134. Since the significance value exceeds the threshold of 0.05, it can be concluded that the residuals are normally distributed from a statistical standpoint.

The coefficient of determination is used to measure the extent to which the independent variables are capable of explaining the variance in the dependent variable. The R^2 value provides an indication of the model's explanatory power. The coefficient of determination obtained in this study is presented in the following table:

Table 5. Hypothesis Testing Results

Model	R	R Square	Adjusted R Square	Std. Error of the Estimate
1	.843	.711	.705	4.021

The coefficient of determination (R^2) obtained in this study is 0.711, or 71.1%. This indicates that the variables' trust level and Shopee features collectively explain 71.1% of the variation in the purchasing decisions of Generation Z students. The remaining 28.9% is influenced by other variables not included in the model.

The simultaneous test, also known as the F-test, was conducted to evaluate whether the variables' trust level and Shopee features jointly have a significant effect on purchasing decisions. The test was carried out at a 95% confidence level, or a significance level of α = 0.05 (5%). The criteria for decision-making are as follows:

- If the calculated F-value (F_{calculated}) ≤ F-table, then the null hypothesis (H_0) is accepted and the alternative hypothesis (H_1) is rejected, indicating that the independent variables do not have a simultaneous effect on the dependent variable.
- If the calculated F-value (F_{calculated}) ≥ F-table, then the null hypothesis (H_0) is rejected and the alternative hypothesis (H_1) is accepted, meaning that the independent variables do have a simultaneous effect on the dependent variable.

Table 6. Simultaneous Test (F-Test)

Model	Sum of Squares	df	Mean Square	F	Sig.
Regression	3850.581	2	1925.29	119.083	.000
Residual	1568.259	97	16.168		
Total	5418.84	99			

Based on the table above, it can be concluded that the calculated F-value (F_{calculated}) is 119.083, which is greater than the F-table value of 3.09. Additionally, the significance value is 0.000, which is lower than the alpha level of 0.05. Therefore, the decision is to reject the null hypothesis (H_0) and accept the alternative hypothesis (H_1). This result indicates that the independent variables—trust level (X_1) and Shopee features (X_2)—collectively have a significant explanatory power on the dependent variable (purchasing decision (Y)). Thus, it can be concluded that trust and Shopee features have a simultaneous positive and significant effect on the purchasing decisions of Generation Z students. The partial test, also referred to as the T-test, is used to determine the individual effect of each independent variable—trust level and Shopee features—on the dependent variable, purchasing decision. The criteria for hypothesis testing are as follows:

If the calculated t-value (t_{calculated}) ≤ t-table, then the null hypothesis (H_0) is accepted and the alternative hypothesis (H_1) is rejected. This implies that the variable, when tested individually, does not have a significant effect.
If the calculated t-value (t_{calculated}) ≥ t-table, then the null hypothesis (H_0) is rejected and the alternative hypothesis (H_1) is accepted. This indicates that the variable, when tested individually, does have a significant effect.

Table 7. Partial Test (T-Test)

Model		B	Std. Error	Beta	t	Sig.
1	(Constant)	8.357	2.054		4.068	0
	tingkat kepercayaan	0.436	0.102	0.509	4.283	0
	fasilitas shopee	0.355	0.118	0.358	3.01	0.003

Based on the table presented, the following conclusions can be drawn:

i. The calculated t-value for the trust level variable is 4.283, which is greater than the t-table value of 1.984, with a significance level of 0.000, which is less than the alpha value of 0.05. Therefore, H_0 is rejected and H_1 is accepted. This indicates that, partially, the trust level variable has a positive and significant effect on purchasing decisions.
ii. The calculated t-value for the Shopee features variable is 3.010, which also exceeds the t-table value of 1.984, with a significance level of 0.003, which is less than the alpha level of 0.05. As a result, H_0 is rejected and H_1 is accepted, meaning that, individually, the Shopee features variable has a significant influence on purchasing decisions.

4. Conclusion

Based on the research findings, it can be concluded that both trust and the Shopee PayLater service have a positive and significant influence on the purchasing decisions of Generation Z university students, both individually and simultaneously. Among the two variables, trust emerged as the most dominant factor. This conclusion is supported by the results of the t-test and F-test, both of which yielded significance values below the 0.05 threshold. Additionally, the coefficient of determination (R^2) was 71.1%, indicating that these two factors accounted for the majority of the variance in purchasing decisions. The remaining 28.9% is influenced by other variables not examined in this study. Therefore, enhancing consumer trust and ensuring that the Shopee PayLater service remains accessible, convenient, and user-friendly can

encourage Generation Z students to increasingly choose Shopee as their preferred online shopping platform.

*Corresponding author e-mail address: Kuna40769@gmail.com

Abstract

Small-scale boat manufacturing in Belawan is classified as a medium-sized business. This small-scale fishing boat manufacturing business plays a vital role in Belawan's economy, as it is the most important port on the island of Sumatra and one of the areas with a fairly large fishing sector. Belawan is also a gathering place for fishermen. This study focuses on identifying the cost management strategies used to set selling prices and assessing the income generated by small-scale fishing boat manufacturers. The objective of this study is to examine cost management strategies and pricing decisions to enhance the income of fishing boat manufacturing businesses. The research method employed in this study is qualitative, involving direct observation and interviews with business owners. The results of this study indicate that the production cost management strategies employed by business owners involve reducing raw material costs and implementing effective production planning. Meanwhile, selling prices are determined based on production costs, desired profit margins, and market analysis. The study also shows that appropriate production costs and selling prices can increase business income and generate profits commensurate with the production costs incurred.
Keywords: Strategy; Pricing; Production costs; Selling price; Income.

1. Introduction

Small-scale fishing boat manufacturing in Belawan is one of the small business sectors with great potential to increase the income and economy of the surrounding community. This business manufactures small fishing boats for catching fish in the sea and rivers. These fishing boats are available in small, medium, and large sizes. However, the owners of these small businesses only produce small and medium-sized boats. This small-scale fishing boat manufacturing business plays a crucial role in the economy of Belawan, as it is one of the most important ports on the island of Sumatra and one of the regions with a significant fishing industry. Belawan is also a gathering place for fishermen. Therefore, this small-scale fishing boat manufacturing business is crucial for the local economy. These boats are the primary tool for fishermen to catch fish, becoming the main commodity in domestic and international markets. Additionally, this boat-making business can provide employment opportunities for the local community.

However, this industry often faces high production costs, low selling prices, and intense market competition. High production costs can decrease business income. Therefore, effective and efficient production cost management strategies are needed to increase the income of these small businesses. Setting the right selling price is crucial to increasing business income. A selling price that is too low can decrease income, while a selling price that is too high can deter

consumers from purchasing. This small-scale fishing boat manufacturing business is classified as a micro, small, and medium enterprise (MSME). MSMEs are businesses with limited initial capital, few assets, and a small number of employees. Public authorities or other institutions determine the definition of capital value or the number of employees for specific purposes. Therefore, MSMEs are businesses that fall under the small or limited-scale category. However, MSMEs continuously strive to maintain customer satisfaction (Alimudin et al., 2019).

This small-scale fishing boat manufacturing business is classified as a microenterprise owned by an individual. This business is located at Lk 9 Bom Lama, Medan Labuhan District, Medan City, North Sumatra. This small-scale fishing boat manufacturing business, owned by Mr. Ifan, has operated since 2010 and continues to thrive today, receiving positive feedback from the community. However, one thing that has prevented this small business from updating its operations is that the business owner still uses manual data management methods, such as manually recording transactions and production costs. This makes it difficult for the business owners to analyse their performance and determine whether the business is growing. Therefore, research is needed to find effective and efficient strategies for managing production costs and setting selling prices to increase the income of small-scale fishing boat manufacturing businesses in Belawan. For this reason, the author has conducted research titled "Strategies for Managing Production Costs and Setting Selling Prices to Increase the Income of Small-Scale Fishing Boat Manufacturing in Belawan".

This study was conducted to develop effective strategies for managing production costs and setting selling prices to increase the income of small fishing boat manufacturing businesses in Belawan, considering the findings of previous similar studies, such as:

i. "Pricing Strategies for Products to Increase Sales Volume at PT. Bowok ITAB Bahagia Palembang" by Melvia Anggraini (2022). This qualitative study aimed to determine how product pricing strategies can increase sales volume at PT. The researcher used Fandy Tjiptono's theory, specifically the pricing and price flexibility strategies for new products. The results of this study indicated that the company has implemented pricing strategies effectively, although there are some challenges and obstacles in their implementation.
ii. "Production Cost Management in Determining Farmer Income in Citrus Farming in Sidomulyo Village, Semboro District, Jember Regency" by Dwi Setia Nur Laili (2023). The focus of this study was on how production costs are managed in citrus farming operations, as well as to determine how much income citrus farmers earn. This research used a qualitative approach and descriptive research. The subjects of this study were selected using purposive sampling. Data collection techniques included observation, interviews, and documentation.
iii. "Determining the Selling Price at Bofet Martabak Wadesta Bandar Buat" by Agusra (2022). This study aimed to determine how to set the selling price at Bofet Martabak Kubang Bandar Buat. The method used was qualitative descriptive research. Data collection was carried out using documentation and observation methods.

Strategy is the science of planning and determining the direction of large-scale business operations, mobilising all company resources that can be profitable. John A. Bryne defines strategy as a fundamental pattern of goals and plans, resource allocation, and organisational interactions with the market, competitors, and environmental factors. According to David, strategy is a unified, comprehensive, and integrated plan that connects a company's strategic advantages with environmental challenges. It ensures the organisation can achieve its primary objectives through proper implementation. Strategy is a set of integrated and coordinated actions taken to leverage core competencies and gain a competitive advantage. A company's success, as measured by strategic competitiveness and high profitability, is a function of its ability to develop and use new core competencies faster than competitors' efforts to imitate existing advantages.

Building a buying and selling business will inevitably involve pricing. Price is important in the sale and purchase agreement between producers and consumers (Luo et al., 2022). Through pricing, the economic value of a product can be determined. Because of this issue, companies usually agree on prices before goods are distributed in the market.

Mulyadi (2010) states that production costs are costs incurred in managing raw materials into products. Production costs are used to calculate the cost of finished products and those still in process at the end of the accounting period. Production costs are an important source of information for analysing business strategies. Determining and analysing a company's costs can illustrate its future performance. Production costs are the total costs of manufacturing or producing goods and services. They include all expenditures incurred by a company to obtain production factors and raw materials used in the production process and to produce the final products manufactured by the company.

Production costs are all costs and economic resources incurred during the production process to transform raw materials into finished goods. Production costs are classified into direct material, direct labour, and factory overhead. On the other hand, non-production costs are unrelated to production functions, such as research and development, distribution, customer service, and general administration. Production costs can be effective and efficient if the produced output meets quantity and quality standards commensurate with the price. This ensures that the incurred costs are appropriately utilised and do not indicate waste. Therefore, management must evaluate various production cost factors to achieve efficiency and reduce standard costs, inevitably impacting the company's profitability.

Price is the amount of money that can be exchanged for a good or service by purchasing it, thereby fulfilling consumers' needs and desires. In addition, price can also be understood as the value exchanged between consumers and sellers, whereby consumers obtain benefits from products or services and sellers receive compensation in the form of money. Selling price directly impacts a company's profitability; optimal pricing can help a company achieve its profit targets and maximise revenue. A company can set prices that support long-term business growth by understanding production costs, market structure, and demand levels. Competitive and adaptive pricing management is the key to successful marketing, enabling a company to remain more competitive, build consumer trust, and achieve its financial goals.

According to economics, revenue results from selling goods or services by a company during a specific period. In fact, it is not only the result of sales; a company's revenue can also come from interest on company assets used by other parties, dividends, and royalties. All of these are totalled and recorded in the company's books. Income can also be defined as the costs charged to customers or consumers for the price of goods or services. Income is a crucial factor in a company as it serves as a measure of the company's progress or decline. The larger the income, the more advanced the company is considered, and vice versa.

2. Methodology

The research method used is qualitative descriptive, with data collection through field observation and direct interviews with business owners. The research method analyses data by describing or depicting the collected data as it is, without intending to make conclusions that apply to the general public. Using data obtained from business owners, researchers can analyse and conclude what costs are incurred by business owners and how much income is earned by business owners.

This study's sample focuses on one small fishing boat manufacturing business. The data collected was related to this business. The data included all financial data, production costs, and selling prices for December 2024.

3. Results and discussion

The production cost management strategy implemented by business owners is to collect the total production costs and calculate the costs incurred to produce both large and small ships. The following are some of the production costs for large and small boats.

Table 1. The Production Costs for Large Boats

Standard chart costs	Cost	Total
Wood	Rp12.950.000	
Rope	Rp150.000	Rp13.940.000
Special Materials	Rp840.000	
Labor costs		
3 people × 8 days	Rp130.000/person	Rp3.120.000
Overhead costs		
Other costs	Rp1.250.000	Rp.1.250.000

Table 2. The Production Costs for Small Boats

Standard chart costs	Cost	Total
Wood	Rp6.600.000	
Rope	Rp75.000	Rp7.125.000
Special Materials	Rp450.000	
Labor costs		
3 people × 8 days	Rp130.000/operson	Rp1.950.000
Overhead costs		
Standard chart costs	Rp1.250.000	Rp1.250.000

The table above shows that the production cost of a 30-foot (large) boat is Rp18,310,000, and for a 20-foot (small) boat is Rp325,00000. The production cost includes labour costs and overhead costs. This is a strategy for business owners to calculate and manage boat production costs so that it is easier to calculate all the costs incurred.

Effective production cost management and pricing strategies can increase business revenue. Additionally, business owners must implement the right strategy to reduce production costs and set competitive selling prices. The total production costs for a small-scale fishing boat manufacturing business in Belawan for three boats, two large and one small, amount to Rp46,945,000, with raw material costs being a significant portion of the total. Thus, it is critical for business owners to manage raw material costs to enhance production efficiency.

In determining the selling price of products, business owners must consider the optimal selling price to match the price listed on the market. The cost of production is not the only factor in determining the selling price of a business; by calculating the cost of production, business owners can calculate the amount of income generated and whether it is profitable or not. According to business owners, the calculation of the selling price of ships is as follows:

No	Type of ship	Selling price (Rp)	Produksi volume
1	30-foot boat	Rp25.000.000	1
2	20-foot boat	Rp13.000.000	1

According to the results of interviews with business owners, the table above shows that large boats are sold for Rp25,000,000 and small boats for Rp13,000,000. So, if the business owner produces two large boats and one small boat in one month, the calculation is as follows.

Large ship = 25.000.000 × 2 = 50.000.000
Small ship = 13.000.000 × 1 = 13.000.000
Total = 63.000.000

Therefore, the total sales of two large and one small boat during the month amounted to Rp63,000,000. Boat sales calculations depend on consumer demand each month. However, according to a direct interview with the business owner, he only accepts three boats per month. The selling price is also set according to the market price or the price that other boat business owners agreed upon. In setting the selling price of the product, the business owner also considers the optimal selling price to align with the prices listed in the market. The business owner themselves determines the boat's selling price, with the set prices being Rp25,000,000 for a 30-foot (large) boat and Rp13,000,000 for a 20-foot (small) boat. The prices set by the business owner have been calculated and considered based on other factors such as market prices and product quality. Based on interviews with business owners, business revenue is calculated from sales minus expenses such as raw material costs, direct labour costs, and overhead costs, and it can be broken down as follows.

i. For a large boat:
   Revenue from the sale of two ships = Rp50,000,000
   a. Production costs for two ships = Rp13,940,000
   b. Salary costs × 16 working days = Rp6,240,000
   c. Overhead costs = Rp1,250,000
   d.

   To calculate the total cost above, subtract all expenses from the two large boats' total sales revenue.

   Rp50.000.000
   Rp13.940.000
   Rp6.240.000
   Rp1.250.000 -
   Rp.28.570.000

   So, after totalling, the net income received by the business owner producing two large boats is Rp28,570,000.

ii. For a small boat
   Ship sales revenue = Rp13.000.000
   Production cost of 1 ship = Rp7.125.000
   Salary cost × 5 days = Rp1.950.000

   From the details above, overhead costs are not listed because the production process is still the same as the previous ship production, which can be summarised as follows:

   Rp13.000.000
   Rp7.125.000
   Rp1.950.000 -
   Rp3.925.000

   Based on the details above, the total income from one small ship after deducting production, salary, and overhead costs is Rp3,925,000. So, to calculate the total production costs for three boats, it can be broken down as follows:

   Rp.63.000.000
   Rp.21.065.000
   Rp.8.190.000
   Rp.1.250.000 -
   Rp.32.495.000

   According to the above calculation, the total net income from the sale of three ships minus the cost of raw materials, labour, and overhead costs is Rp. 32,495,000 for a total of 21 working days. This is a significant income in line with the total expenditure for ship production costs for one month. There is a significant difference in income from

the sale of large and small boats. According to the research findings, revenue from selling large-sized boats is more profitable than from small boats.

4. Conclusion

Based on the results of the research conducted, it can be concluded that:

i. Production cost management strategy

In this study, the production cost management strategy implemented by the business owner involves calculating the total production costs and determining all expenses incurred in producing both large and small boats. An effective production cost management strategy and proper pricing can present an opportunity to increase business revenue. The business owner must also implement the appropriate strategy to manage production costs and maintain competitive pricing. The total production costs for a small fishing boat manufacturing business in Belawan for three boats, two large and one small, amount to Rp. 46,945,000, with raw material costs being a significant portion of the total. This highlights the importance of managing raw material costs to enhance production efficiency.

ii. Setting the selling price of products

The cost of production is not the only factor in setting the selling price of a business; by calculating the cost of production, business owners can calculate the amount of income generated and whether it is profitable or not. The selling price is also set in line with market prices or prices agreed upon by other boat owners. When setting the selling price of products, business owners also consider the optimal selling price to align with market prices. The business owner determines the vessel's selling price, with the set price being Rp. 25,000,000 for a 30-foot (large) vessel and Rp. 13,000,000 for a 20-foot (small) boat. The prices set by the business owner have been calculated and considered based on other factors such as market prices and product quality.

iii. Revenue

There is a significant difference in revenue between the sale of large and small boats. According to the results, revenue from selling large boats is more profitable than that from small boats. After deducting raw material, labour, and overhead costs, the net revenue from the small-scale fishing boat manufacturing business amounts to Rp32,495,000. This is substantial revenue and aligns with the total production costs for building a ship over one month.

THE INFLUENCE OF CONSUMER PERCEPTION AND BRANDING STRATEGY ON THE SUSTAINABILITY OF MOTORIZED PEDICAB TRANSPORTATION SERVICES IN BINJAI CITY

Silvi Hinnai*, Ihsan Iskandar

Marketing Management Study Program, Sukma Medan College of Management, 20219 Medan, North Sumatra, Indonesia

*Corresponding author e-mail address: silvihinnai@gmail.com

Abstract

This study aims to analyse the influence of consumer perception and branding strategy on the sustainability of motorised pedicab (becak mesin) transportation services in Binjai City, North Sumatra, Indonesia. The method used in this study is a quantitative approach through a survey using questionnaires distributed to users of motorised pedicab services. The research sample consisted of individuals previously using motorised pedicab services in Binjai City. The sampling techniques employed were accidental sampling and purposive sampling. Data analysis techniques included validity tests, reliability tests, multiple linear regression, t-test, F-test, and the coefficient of determination. The findings reveal that consumer perception and branding strategy collectively influence the sustainability of motorised pedicab businesses. However, branding strategy plays a more dominant role in ensuring business continuity because, partially, consumer perception does not have a significant effect, as indicated by a significance value. These findings highlight the importance of motorised pedicab drivers in Binjai City, strengthening their branding strategies, as they strongly impact the sustainability of their business operations.
Keywords: Branding; Consumer-perception; Motorised-pedicab.

1. Introduction

To support economic advancement in every region, transportation is essential in facilitating the movement of people from one place to another. In the city of Binjai, motorised pedicabs have long been recognised as one of the most popular modes of public transportation. A motorised pedicab is a motor-powered vehicle that has become integral to the city's culture and history. Typically, it "accommodates two passengers and one driver, operating on three wheels for its movement" (Setiawan, 2021; Ikhsana et al., 2024). "Before the rise of online transportation services, motorised pedicabs were the primary choice for residents travelling short to medium distances" (Haryanto et al., 2022). Almost every corner of Binjai City could easily be found with pedicab drivers ready to take passengers to their destinations. However, in recent years, the transportation landscape in Binjai has undergone significant changes due to the emergence of various online transportation applications. These services offer "easy access, competitive pricing, and a variety of appealing features, providing the public with new alternatives to meet their mobility needs" (Nurlaela et al., 2023; Haryanto et al., 2022).

Pedicabs first arrived on the island of Sumatra, specifically in Medan, in the early 1950s as manually-pedalled rickshaws (Zuliana & Lukitaningsih, 2022). The Chinese community initially brought these rickshaws from Hong Kong to the Deli region. Over time, they evolved and made their way into the city of Binjai, transforming into a motor-powered means of transport known today as the motorised pedicab. Motorised pedicabs have existed in Binjai city since the 1980s, originally referred to as bromfit, which were traditional pedicabs with an attached fuel-powered tax engine (Zuliana & Lukitaningsih, 2022). The propulsion systems of these pedicabs have also developed over time. With the introduction of motorcycles in the 1990s, motorised pedicabs began to use newer motorcycle models as their driving engines. Since

then, they have continued to evolve as a widely used means of transportation, particularly among traders who rely on them to transport goods. Motorised pedicabs were favoured during that period because "they could carry a large amount of cargo, were faster than other traditional transport options such as horse- or buffalo-drawn carts, and were more affordable than cars" (Zuliana & Lukitaningsih, 2022). Moreover, motorised pedicabs were easily accessible and offered lower fares than other transportation modes.

Fig. 1. Motorised Pedicab

The advantages of motorised pedicabs have made them a popular means of transportation that is deeply rooted in the community. Many residents have chosen to make a living through this mode of transport, as seen in the widespread emergence of motorised pedicab drivers offering transportation services to the public. Over the years, the primary users of motorised pedicabs have been housewives shopping at traditional markets and traders transporting their goods. This phenomenon occurs because motorised pedicab drivers often wait for passengers in densely populated areas and public places such as traditional markets, shopping centres, parks, tourist attractions, and other public facilities. Considering their deep historical roots in the community, motorised pedicabs remain a transportation mode worth preserving and are still needed today. They are especially relevant in traditional markets, shopping centres, and public open spaces, where they serve as a convenient, affordable, and practical option. Their capacity to carry a significant cargo greatly benefits housewives who shop in bulk and small-scale traders who need to transport goods.

The main factor contributing to the decline in public interest in using motorised pedicab services—once a preferred choice before the digital era—is the shift in consumer perception. Consumer perception refers to the way individuals interpret problems, phenomena, environments, experiences, service quality, and brands based on conceptual frameworks, assumptions, values, ideas, and specific perspectives within a given context (Rachman et al., 2022; Sahputri et al., 2023; Kaban & Kunci, 2022). This shift in perception has led consumers to transition from motorised pedicabs to online ride-hailing services, which offer more advantages. These include lower fares, features such as "trip tracking, cashless payments, and driver ratings, all of which contribute to a more comfortable riding experience" (Pribadiono, 2016).

Branding strategy is a coordinated plan that unifies all aspects of management to achieve final objectives such as profit, trust, added value, and a positive image to attract and retain customers in both goods and services sectors (Nurdiansyah & Rugoyah, 2021; Karsono et al., 2021). Therefore, according to Utomo et al. (2023), an effective branding strategy is essential to build public trust and interest in encouraging people to return to using motorised pedicabs as a viable accommodation mode. Previous studies have shown that appropriate branding strategies, such as popularising the term 'sharia pedicab' in Aceh and aligning motorised pedicab fares with those of online ride-hailing services, can assist motorised pedicab drivers in sustaining their businesses" (Ikhsana et al., 2024; Setiawan, 2021). Based on initial observations and interviews with several motorised pedicab drivers operating near the Binjai Train Station, it was found that public interest has significantly declined in recent times, with

most people opting for alternative transportation options. The drivers reported that prospective passengers often rejected their services for various reasons, including higher fares compared to online rides, discomfort during rides, difficulty locating pedicabs, untidy appearance of the drivers, and perceived lack of safety of the vehicles. As a result, many pedicab drivers face negative responses from potential passengers when offering their services.

Given the current reality that consumer perception and branding strategies of motorised pedicab drivers in Binjai city remain suboptimal, the decline in customer interest and passenger numbers is inevitable. This situation directly impacts the income levels of motorised pedicab drivers. The phenomenon poses a serious threat, as reduced earnings can jeopardise the sustainability of the pedicab drivers' businesses, which often serve as their sole source of livelihood. Therefore, this research is highly significant. The urgency of this study is undeniable, and its findings are expected to provide a solution that helps motorised pedicab drivers develop appropriate branding strategies and foster positive consumer perceptions, thereby ensuring the long-term sustainability of the motorised pedicab industry.

Table 1. Literature Review

No.	Research Title	Author	Research Method	Research Findings
1	Strategies of Pedicab Drivers in Maintaining Their Occupation After the Emergence of Online Motorcycle Transportation (Case Study: Banda Aceh City)	Farhan Setiawan (2021)	Utilised a qualitative method with data collected through observation, interviews, and documentation.	The findings were categorised into two main strategies. The first was additive strategies, including extending waiting hours, ensuring customer comfort and satisfaction, and maintaining personal appearance.
2	Survival Strategies of Pedicab Drivers in Facing Transportation Competition in Banda Aceh	Liza Ikhsana (2024)	Employed a qualitative case study approach. Data were gathered through observation and in-depth interviews, involving five informants with at least five years of experience as pedicab drivers and over 30 years old.	Strategies included popularising the term “syar’i pedicab” in line with Aceh Province's authority in enforcing Islamic law, and income diversification, where drivers engaged in multiple income-generating activities to compensate for insufficient earnings from their main profession.
3	Branding Strategy in Developing Tourism Industry 4.0 Through Competitive Multimedia in the Digital Era	Isdarmanto[1], Christantinus[2] (2020)	Adopted a qualitative method aimed at exploring and understanding in-depth issues.	The study found that branding development through multimedia programs is highly effective worldwide within institutional and corporate contexts and must be appropriately managed.

2. Methodology

This research was conducted in Binjai City, North Sumatra, Indonesia, specifically in areas where motorised pedicabs operate and around public facilities such as the Taman Balita (Toddler Park), Taman Remaja (Youth Park), Taman Edukasi (Education Park), the terminal, the train station, and the surrounding areas of shopping centres located at various points across five districts: Binjai Kota, Binjai Selatan, Binjai Timur, Binjai Barat, and Binjai Utara. The research is scheduled to be carried out from February to June 2025.

This is quantitative research. The research sample consisted of 100 individuals who had previously used the motorised pedicab transportation service in Binjai City. The sampling techniques used were accidental sampling and purposive sampling. The data analysis technique applied in this study was multiple linear regression analysis, utilising SPSS Statistics software to examine the relationship between variable X1 (consumer perception) and X2 (branding strategy) on Y (business sustainability).

The regression model is formulated as follows:

$$Y = a + b_1X_1 + b_2X_2 + e \quad (1)$$

Information:
- Y = Dependent variable (business sustainability)
- X_1 = Independent variable (consumer perception)
- X_2 = Independent variable (branding strategy)
- a = Constant
- b = Regression coefficient of each independent variable
- e = Error term (other influencing factors not studied)

The data collection technique used was distributing questionnaires to the sample in Binjai City during the predetermined research period. The study also included hypothesis testing through t-test, F-test, coefficient of determination (R^2) test, and validity and reliability testing for the questionnaire statements.

3. Results and Discussion

3.1 Respondent Characteristics

Table 2 shows more female respondents (64 individuals) than male respondents, who were 36 individuals. This was attributed to the fact that most users of motorised pedicab services were women. Field observations revealed a phenomenon in which the majority of public transportation users, including those utilising motorised pedicabs, were women. This tendency was linked to the commonly held perception of women as more gentle, feminine, and dependent on men. As a result, many women lacked the confidence or ability to operate a vehicle independently. Consequently, women tended to be the dominant users of motorised pedicab services to support their daily routines and to travel in a manner they perceived as safe and comfortable. In contrast, men were generally perceived as braver, more masculine, and physically stronger, often leading them to prefer driving their own vehicles. This explained the lower number of male users of motorised pedicab services.

Table 2. Respondents' Characteristics Based on Gender

No.	Gender	Quantity
1	Male	36
2	Female	64
	Total	100

3.2 Validity and Reliability Test

The criterion for the validity test is that the research results are considered valid if there is consistency between the collected data and the actual conditions of the object being studied. An instrument is deemed valid if the measuring tool can accurately obtain the intended data (Priadana & Sugiono, 2021). The data is considered valid if the value of *r-count* is greater than or equal to the *r-table* value, and invalid if it is less than or equal to the r-table value.

Table 3. Validity Test

No	Instruments	Validity Value Rtabel	Validity value Rcount	conclusion
1	X1P1	0.1654	0.937	Valid
2	X1P2	0.1654	0.877	Valid
3	X1P3	0.1654	0.923	Valid
4	X1P4	0.1654	0.927	Valid
5	X1P5	0.1654	0.910	Valid
6	X1P6	0.1654	0.858	Valid
7	X2P1	0.1654	0.702	Valid
8	X2P2	0.1654	0.764	Valid
9	X2P3	0.1654	0.841	Valid
10	X2P4	0.1654	0.763	Valid
11	X2P5	0.1654	0.731	Valid
12	X2P5	0.1654	0.688	Valid
13	YP1	0.1654	0.921	Valid
14	YP2	0.1654	0.890	Valid
15	YP3	0.1654	0.755	Valid
16	YP4	0.1654	0.738	Valid
17	YP5	0.1654	0.870	Valid
18	YP6	0.1654	0.865	Valid

3.3 Reliability Test

A reliable instrument is one that, when used repeatedly to measure the same object, will yield consistent data. A rubber measuring tape, for example, is considered an unreliable instrument due to its tendency to stretch or shrink (Priadana & Sugiono, 2021). An instrument is regarded as reliable if the Cronbach's Alpha value is greater than 0.6. Conversely, the instrument is considered unreliable if the Cronbach's Alpha value is less than 0.6.

Table 4. Reliability Test

Reliability Statistics	
Cronbach's Alpha	N of Items
0.935	18

A questionnaire study was considered reliable if the Cronbach's Alpha value was greater than 0.6. In the table above, the Cronbach's Alpha value obtained for the 18 statements in the questionnaire was 0.935, which was greater than 0.6. Therefore, the questionnaire used in this study was declared reliable, meaning it could be depended on, trusted for its authenticity, and consistent results.

3.4 Multiple linear regression test

This multiple linear regression test was conducted to determine the effect of consumer perception and branding strategy on the business sustainability of motorised pedicab transportation services in Binjai City. The following table presents the results of the multiple linear regression test for each variable:

Table 5. The Result of the Multiple Linear Regression Test

Model	Unstandardized Coefficients (B)	Std. Error	Standardized Coefficients (Beta)	t	Sig.
(Constant)	-0.384	2.706	—	-0.142	0.888
Persepsi Konsumen	0.104	0.124	0.092	0.841	0.402
Strategi Branding	0.875	0.149	0.637	5.854	0.000

Based on the results of the test using SPSS Statistics software, the multiple linear regression equation was obtained and could be written as follows:

$$Y = -0.384 + 0.104\ X_1 + 0.875\ X_2 \quad (2)$$

In the multiple linear regression model, the constant value for business sustainability was -0.384, which meant that if the values of the consumer perception variable and branding strategy variable were zero, the value of business sustainability would be -0.384. This indicated that without the support of these two variables, the level of business sustainability would be very low or even negative.

The coefficient value for consumer perception was 0.104, meaning that every one-unit increase in consumer perception would increase business sustainability by 0.104 units, assuming the branding strategy variable remained constant. However, the significance value (Sig.) for consumer perception was 0.402, greater than 0.05. This indicated that consumer perception did not have a statistically significant effect on business sustainability.

The coefficient value for branding strategy was 0.875, meaning that every one-unit increase in branding strategy would increase business sustainability by 0.875 units, assuming consumer perception remained constant. The significance value (Sig.) for branding strategy was 0.000, which was less than 0.05, indicating that branding strategy had a statistically significant effect on business sustainability.

3.5 Hypothesis Test

Coefficient of Determination (R^2)

Table 6. Hypothesis Test

Model Summary				
Model	R	R Square	Adjusted R Square	Std. Error of the Estimate
1	0.708[a]	0.502	0.492	2.86391

Based on the coefficient of determination test results, the R^2 value was found to be 0.502 or 50.2%, indicating that consumer perception and branding strategy collectively explained 50.2% of the variation in the sustainability of motorised pedicab transportation services in Binjai City. The remaining 49.8% were influenced by other variables not included in this study, such as pricing, service quality, and other external factors.

Simultaneous Test (F-Test)

Table 7. Simultaneous test

Model	Sum of Squares	df	Mean Square	F	Sig.
1 Regression	801.800	2	400.900	48.879	.000[b]
Residual	795.590	97	8.202		
Total	1597.390	99			

From the F-test results, the calculated F-value was 48.327, greater than the critical F-table value of 3.09, and the significance value was 0.000, less than the significance level of 0.05. Therefore, the null hypothesis (H_0) was rejected, and the alternative hypothesis (H_1) was accepted. This indicated that consumer perception and branding strategy had a joint and statistically significant positive influence on the sustainability of motorised pedicab transportation services in Binjai City. The result was primarily influenced by the strong impact of branding strategy, which significantly contributed to the overall effect when combined with consumer perception.

Partial Test (T-Test)

Table 8. Partial Test

Model		Unstandardized Coefficients B	Unstandardized Coefficients Std. Error	Standardized Coefficients Beta	t	Sig.
1	(Constant)	-0.384	2.706		-0.142	0.888
	Persepsi Konsumen	0.104	0.124	0.092	0.841	0.402
	Strategi Branding	0.875	0.149	0.637	5.854	0.000

The T-test results revealed the following:

a. The t-value for consumer perception was 0.841, less than the t-table value of 1.660, with a significance level of 0.402 (greater than 0.05). Hence, the null hypothesis was accepted, and the alternative hypothesis was rejected. This suggested that consumer perception had no significant partial effect on the sustainability of motorised pedicab transportation services.
b. The t-value for branding strategy was 5.854, which exceeded the t-table value of 1.660, and the significance value was 0.000 (less than 0.05). Thus, the null hypothesis was rejected and the alternative hypothesis was accepted. This confirmed that the branding strategy had a positive and statistically significant partial effect on the sustainability of motorised pedicab services in Binjai City.

4. Conclusion

The research concluded that consumer perception did not significantly affect the sustainability of motorised pedicab services in Binjai City. Although perceptions were generally positive, they did not strongly influence continued usage, as practical needs often outweigh personal opinions. In contrast, branding strategy had a significant and positive effect, indicating that the public trusted and preferred services with a strong visual identity and added value. Together, consumer perception and branding strategy had a simultaneous positive and significant impact, explaining 50.2% of the variation in business sustainability. This underscores the importance of building a strong brand and maintaining positive customer impressions to support the long-term viability of motorised pedicab services.

It is recommended that drivers continue to maintain and improve their branding strategies. Visual identity elements—such as signature colours, banners, or symbols—along with cleanliness, polite service, and small innovations (like music or rain covers) could be key differentiators attracting customers. Additionally, pedicab drivers were encouraged to use local social media platforms or community networks for simple promotional efforts. Future studies were encouraged to expand this research by incorporating additional variables, such as customer satisfaction, consumer loyalty, information technology, or even the integration of local transportation systems. Moreover, qualitative methods could be applied to explore in-depth experiences from users and motorised pedicab drivers, providing richer insight into the service dynamics.

THE INFLUENCE OF OWN CAPITAL, LOAN CAPITAL, AND LENGTH OF BUSINESS ON MSMES INCOME IN MEDAN BARU DISTRICT

Jessika Alvena Munthe*, Wendi Amsuri Nasution

Program Studi Manajemen, Sekolah Tinggi Ilmu Manajemen Sukma Medan, Indonesia

*Corresponding author e-mail address: jesikaalvena12@gmail.com

Abstract

Micro, Small, and Medium Enterprises (MSMEs) play an important role in the Indonesian economy but often face obstacles to increasing income due to limited capital. Previous studies have shown that capital structure and business length can affect MSMEs' income level. This study aims to analyse the effect of own capital, loan capital, and length of business on the income of MSMEs in Medan Baru District. This research uses a quantitative approach with descriptive methods. Data were obtained from 87 MSMEs through questionnaires, interviews, and observations, and analysed using multiple linear regression. The results showed that own capital (β = 0.218), loan capital (β = 0.341), and length of business (β = 0.459) had a positive and significant effect on income. Simultaneously, the three variables also significantly affect MSME income (F = 15.059; sig. = 0.000). This finding indicates that combining internal capital, access to external financing, and long business experience are key factors in increasing MSME income and business sustainability.
Keywords: MSMEs; Own capital; Loan capital; Length of business; Income.

1. Introduction

Micro, small, and medium enterprises (MSMEs) play an important role in the Indonesian economy in job creation and as a pillar of national economic stability. This is clearly evident during times of crisis, when MSMEs remain resilient while large companies experience stagnation or even closure. This happened because people's incomes declined during the monetary crisis, but this did not affect demand for goods. This is in contrast to large businesses, which actually collapsed due to a decline in market demand. Therefore, MSMEs succeeded in saving the Indonesian economy at that time (Helmalia & Afrinawati, 2018). MSMEs are huge in Indonesia's economic growth, contributing 99% of total business units. In 2023, there will be an estimated 66 million MSMEs. MSMEs contribute 61% of Indonesia's Gross Domestic Product (GDP), equivalent to Rp9,580 trillion. MSMEs employ around 117 million workers (97%) of the total workforce (Kementrian Perekonomian, 2023).

Amid intense business competition and uncertain economic conditions, many micro, small and medium enterprises (MSMEs) have difficulty increasing their income. Income is significant because it is the object of company activities (Widarma, 2019). The greater the revenue earned, the greater the ability of the business to finance all expenses or daily operational costs that will be carried out (Salim & Rahmadhani, 2024). The main problem MSMEs face in increasing their business income relates to capital (Rahma, 2021). Business capital is used to establish or manage a business (Muhammad,2020).
Own capital and loan capital are the two primary funding sources for MSMEs. Equity capital comes from personal assets or personal funds, which is often considered a more stable source of funding because it does not incur interest payments. Many MSME entrepreneurs start their businesses using their own capital. However, in practice, equity capital is often insufficient to maintain business continuity. Initial surveys indicate that equity capital is insufficient to meet long-term operational needs, mainly due to low sales volume and low Return on Equity (ROE), which is the ratio of profit to capital owned. As a result, the income generated is insufficient to

cover operational costs and even to return the capital that has been spent. This makes it difficult for the company to produce new goods or expand its operations.
To maintain business continuity, MSMEs depend on loan capital from external sources, such as formal financial institutions, such as banks and informal institutions, such as cooperatives or digital lending platforms (Fintech). Based on Law No. 25 of 1992, loan capital can come from members, cooperatives, banks or non-bank institutions, debt securities, and other legal sources. Parties involved in business activities are required to settle or pay debts agreed upon by both parties, and the use of loan capital will be subject to administrative fees, interest, and commissions (Chaedar, Blongkod, & Taruh, 2023).

Fintech combines technology and economics to facilitate online financial transactions (Darmika, 2021). It refers to the latest technology applied in innovative financial products and services (Harrison & Arifin, 2024). Despite higher interest rates, Fintech is very helpful for MSMEs that do not have access to formal financial institutions.

Apart from the type and source of capital, the length of business also dramatically affects the income of MSMEs. According to Marfuah & Hartiyah (2019), the length of business is the length of time business actors run their business. Long-established businesses have regular customers, better management systems, and experience facing business challenges. In contrast, newly established MSMEs often do not have a strong customer base and still face challenges stabilising revenue.

To illustrate the conditions in the field more clearly, researchers conducted an initial survey of MSMEs in Medan Baru sub-district. The survey was conducted on six MSMEs with different characteristics. The results showed significant variations in the age of the business, the amount of loan obtained, the interest rate, the loan tenure, and the source of financing. MSMEs that have been operating for a long time, such as Toko Baju Nd Intan (8 years) and Ebyna Studio (6 years), obtain financing from formal financial institutions such as banks with relatively low annual interest rates of 10% and 12%, respectively. In contrast, newly established MSMEs, such as Toko Salju (8 months) and Bajumu (1.5 years), tend to obtain financing from cooperatives and fintech platforms with much higher interest rates, ranging from 24% to 30% per year.

In terms of loan tenors, MSMEs that have been operating for an extended period generally obtain longer loan tenors of between 4 and 5 years. Meanwhile, newer MSMEs only obtain tenors of around 2 to 3 years. In addition, differences in financing sources are also evident. Established MSMEs can more easily access bank loans, while newly established MSMEs rely more on non-bank institutions such as cooperatives and Fintech as financing alternatives.
This finding suggests that the age of the business plays an important role in determining the ease of access to formal financing. This affects not only the amount of loan received but also the interest rate and loan term agreed upon. This poses a challenge for efforts to strengthen the sustainability and growth of MSMEs, especially amid evolving economic dynamics and uncertainties.

Trio Rinjaya (2020) states that one's capital has no positive effect on MSME income. Yunus (2021) shows that loan capital has a positive effect on the income of micro, small, and medium enterprises in Jayapura city. Alkumairoh and Warsitasari (2022) state that the length of business has a positive effect on MSME income, while Polandos, Engka, and Tolosang (2019) show that the length of business has no significant effect on the income of MSME entrepreneurs in Langowan Timur sub-district.

Based on this background, the following problem formulation can be made:

i. How does own capital affect the income of MSMEs in Medan Baru District?
ii. How does loan capital affect the income of MSMEs in Medan Baru sub-district?

iii. How does the length of business affect the income of MSMEs in Medan Baru sub-district?
iv. What is the effect of own capital, loan capital and length of business on the income of MSMEs in Medan Baru sub-district?

2. Methodology

The type of research used in this study is quantitative research with a descriptive approach. The research location is at Jl. Jamin Ginting No.354, Padang Bulan, Kec. Medan Baru, Kota Medan, Sumatera Utara 20157. The types of data used in this study are primary and secondary. The data collection techniques used in this study are observation, interviews, and questionnaires. The data analysis technique used is multiple linear regression analysis, Hypothesis testing (partial test (t-test), simultaneous test (F-test)) and coefficient of determination (r^2).

3. Results and discussion

Multiple linear regression analysis is an analytical tool used to predict changes in the value of the dependent variable if the value of the independent variable is increased or decreased (Sugiyono, 2020). This study uses multiple linear regression analysis because it aims to examine the simultaneous influence of several independent variables, namely own capital (X1), loan capital (X2), and length of business (X3), on MSME income (Y). This method is considered appropriate because it can explain the linear relationship between these variables and provide a statistical description of the contribution of each variable (Sugiyono, 2021). Calculations using SPSS version 26 produce the following data:

Table 1. Results of the multiple linear regression test

Model		Unstandardized Coefficients		Standardized Coefficients	t	Sig.
		B	Std. Error	Beta		
1	(Constant)	-.278	3.240		-.086	.932
	MS TOTAL	.218	.102	.191	2.133	.036
	MP TOTAL	.341	.092	.348	3.714	.000
	LU TOTAL	.459	.142	.308	3.240	.002

Based on the table, from the data processing results, the following multiple linear regression equation was obtained:

$$Y = -0{,}278 + 0{,}218X1 + 0{,}341X2 + 0{,}459X3 \quad (1)$$

Based on the multiple linear regression equation, this means the following:

i. The constant value indicates that if all independent variables (own capital, borrowed capital, and length of business) are 0, then the income of MSMEs in Medan Baru Sub-district is predicted to be -0.278 units. While this is practically impossible, as no business runs without capital and time, the constant value is still important as a starting point in the regression equation. This negative value does not indicate that the revenue will be negative, but serves as a mathematical basis in the estimation model.
ii. This means that every one unit increase in the own capital variable will increase MSME income by 0.218 units, assuming other variables remain constant. Although the effect is positive, the effect of own capital on income is relatively smaller than that of loan capital and the length of business. This can be caused by the limited personal capital owned by MSME actors, so the scale of investment made is also limited.

iii. Every one unit increase in loan capital will increase MSME income by 0.341 units, assuming other variables remain constant. This shows that loan capital plays an important role in increasing business income. External financing allows MSMEs to develop production scale, expand business, and improve service quality, which positively impacts income.
iv. The highest coefficient in this model indicates that each additional year of business duration will increase revenue by 0.459 units. This indicates that the length of business has a very strong influence on revenue. Longer-established businesses generally have better experience, wider customer networks, and stronger business reputations. In addition, established businesses have easier access to financing from formal institutions with lower interest rates, which can increase income.

The hypothesis in this study is formulated as follows:

a. H_0 (Null Hypothesis): There is no significant influence between own capital, loan capital, and length of business on the income of MSMEs in Medan Baru District.
b. H_1 (Alternative Hypothesis): There is a significant influence of own capital, loan capital, and length of business on the income of MSMEs in Medan Baru District.

Results of the t-test (partial test)

According to Sugiyono (2020, p.31), partial tests are used to determine the effect of each independent variable on the dependent variable. This test is performed by comparing the t-value with the t-table or looking at the significance column for each t-value. This test aims to compare t_{count} with t_{table} at a significance level of 5%. The t-test is considered significant if the result of t_{count} with t_{table} or the error probability is less than 5% (sig <0.05). The basis for decision making is as follows:

a. If t count> t table, then H_0 is rejected and H_1 is accepted.
This means that the independent variable tested has a significant effect on the dependent variable, partially.
b. If t count < t table, then H_0 is accepted and H_1 is rejected.
This means that the independent variable does not have a significant effect on the dependent variable, partially.

Partial testing can be seen from the value $t_{count} > t_{table}$. To determine the value of the t-table, first calculate the degrees of freedom using the formula Df=n-k.
Df = 87-4 = 83, the t-table value at DF=83 with a significance level of 0.05 is 1.989.

Table 2. Results of the t-test (paired test)

Model		t	Sig.
1	(Constant)	-.086	.932
	MS TOTAL	2.133	.036
	MP TOTAL	3.714	.000
	LU TOTAL	3.240	.002

Based on Table 2, the relationship between each independent variable and the dependent variable can be seen as follows:

1. The variable of own capital has a t of 2.133 > t_{table} 1.989 and a significance value of 0.036 < 0.05, which means that the variable is significant. It can be concluded that own capital

has a positive and significant effect on the income of MSMEs in Medan Baru District, so the hypothesis is accepted.
2. The loan capital variable has a t_{count} of 3.714 > the$_{table}$ of 1.989 and a significance value of 0.000 < 0.05, which means that the variable is significant. It can be concluded that loan capital has a positive and significant effect on the income of MSMEs in Medan Baru District, so the hypothesis is accepted.
3. The business duration variable has a t_{count} of 3.240 > the t_{table} of 1.989 and a significance value of 0.002 < 0.05, which means that the variable is significant. It can be concluded that business duration has a positive and significant effect on the income of MSMEs in Medan Baru District, so the hypothesis is accepted.

F-test results (simultaneous test

A simultaneous test (F test) was conducted to determine how much the independent variables collectively influence the dependent variable (Ghozali, 2020). An F-test was also conducted to analyse the combined effect of all independent variables on the dependent variable. The significance level used is 0.05 or 5%. If the significance value of F < 0.05, this can be interpreted as the independent variables simultaneously affecting the dependent variable or vice versa. The F test can use a significant multiple correlation formula. The guidelines for comparing $F_{calculated}$ and F_{table} are:
a. If the value of Fcount ≤ Ftable, then H_0 is accepted and H_1 is rejected (that is, there is no significant simultaneous effect).
b. If the value of Fcount > Ftable, then H_0 is rejected and H_1 is accepted (that is, there is a significant simultaneous influence between the independent variables on MSME income).

Df1 = k - 1, so df1 = 4 - 1 = 3
Df2 = k - 1, so df2 = 87 - 4 = 83
So the F table value is 2.715

Table 3. F-test Results (simultaneous test)

	Model	Sum of Squares	df	Mean Square	F	Sig.
1	Regression	358.391	3	119.464	15.059	.000[b]
	Residual	658.460	83	7.933		
	Total	1016.851	86			

Based on the F test in Table 3 above, the $F_{calculated}$ is 15.059 with a significance level of 0.000. Since $F_{calculated}$ is greater than F_{table} (15.059 > 2.715), H3 is accepted. Thus, equity capital, loan capital, and the length of business operation simultaneously affect the income of MSMEs in Medan Baru District.

In regression analysis, the coefficient of determination (R^2) measures the extent to which the regression model can explain variations occurring in the dependent variable based on the independent variable. The use of R^2 is important because it provides information about the level of fit of the model with the data being analysed. The higher the R^2 value, which ranges from 0 to 1, the greater the proportion of variation in the dependent variable that can be explained by the independent variable, which indicates that the model has good predictive power (Sugiyono, 2022).

In addition to R^2, the adjusted coefficient of determination or Adjusted R^2, is also used, especially in multiple regressions involving more than one independent variable. Adjusted R^2 provides a more accurate estimate because it considers the number of independent variables in the model, so it can avoid the overestimation that may occur with the usual R^2 value (Ghozali, 2018: 97). According to Perdana (2020: 105), Adjusted R^2 is more suitable for use in multiple regression analysis. This is in line with the opinion of Supriyanto et al. (2022: 252),

which states that Adjusted R² provides a more realistic picture of the contribution of each independent variable to the dependent variable. The coefficient of determination test value can be seen in the Adjusted R Square value in Table 5:

Table 4. Results of the coefficient of determination test

Model	R	R Square	Adjusted R Square	Std. Error of the Estimate
1	.594[a]	.352	.329	2.817

The Adjusted R² value obtained in this study is 0.329 or 32.9%, indicating that the independent variables consisting of own capital, loan capital, and length of business can only explain 32.9% of the variation in MSME income. Meanwhile, the other 67.1% variation is influenced by other factors that are not included in this regression model. This relatively low determination value indicates the possibility of model bias, especially omitted variable bias, a condition where important variables are not included in the model, thus reducing estimation accuracy and predictive power.

Similar conditions were also found in previous studies. For example, research by Taha (2022) on MSMEs in South Halmahera Regency shows an Adjusted R² value of 15.0% which indicates that most of the variation in income cannot be explained by the variables in the model. The same thing was also found by Widiatmika (2019), who examined the factors affecting the performance of MSMEs in Indonesia, and obtained a determination value of 26%, thus concluding that there are still many other variables that have not been included in his analysis model. Thus, the Adjusted R² value of 32.9% reflects the need to expand the model by including other variables such as the number of workers, strategic location, and business digitalization so that the analysis of MSME income in Medan Baru Sub-district can be more comprehensive.

From various trials conducted, answers to each problem formulation were obtained. The discussion of the research will be explained as follows:

Own capital has a positive and significant effect on the income of MSMEs in Medan Baru District. The study results indicate that own capital has a positive and significant effect on the income of MSMEs in Medan Baru District. The paired test (t) produced a t-value of 2.133 with a significance level of 0.036. Since the significance level is less than 0.05, own capital has a positive and significant effect on the income of MSMEs in Medan Baru District. Therefore, it can be concluded that hypothesis (H1) is accepted.

Loan capital has a positive and significant impact on the income of MSMEs in Medan Baru District. The study results indicate that loan capital has a positive and significant effect on the income of MSMEs in Medan Baru District. Based on the paired significance test (t-test) using SPSS, the t-value is 3.714 with a significance level of 0.000. Since the significance level is less than 0.05, it can be concluded that loan capital has a positive and significant effect on the income of MSMEs in Medan Baru District. Therefore, it can be concluded that hypothesis (H2) is accepted.
Operating hours have a positive and significant impact on the income of MSMEs in Medan Baru District. The study's results indicate that the length of time a business has been operating has a positive and significant effect on the income of MSMEs in Medan Baru District. Based on a one-sample partial significance test (t-test) using SPSS, the t-value obtained was 3.240 with a significance level of 0.002. Since the significance value is less than 0.05, it can be concluded that the loan has a positive and significant effect on the income of MSMEs in Medan Baru District. Therefore, it can be concluded that hypothesis (H3) is accepted.

Own capital, loan capital, and the length of business operation have a positive and significant impact on the income of MSMEs in Medan Baru District. The study results indicate that own

capital, loan capital, and length of operation have a positive and significant effect on the income of MSMEs in Medan Baru District. The simultaneous test produced an F value of 15.059 and a significance value of 0.000. Thus, it can be concluded that own capital, loan capital, and length of operation have a significant effect on the dependent variable, namely MSME income.

4. Conclusion

Conclusions after conducting tests on the variables of own capital, loan capital, and length of business against MSME income in Medan Baru District using quantitative methods with a descriptive approach using SPSS version 26, with a sample size of 87 MSMEs using the Slovin formula. The conclusions of this study are:

i. Own capital has a positive effect on MSME income. This shows that the more personal funds or profits business actors reinvest, the greater the potential income generated. Own capital also reflects independence and initial financial stability, which are important in supporting business activities.
ii. Loan capital has a positive impact on MSME income. This means that access to loans, whether from formal or informal institutions, greatly helps business actors expand their businesses, increase production capacity, and add working capital, which directly impacts income growth.
iii. The length of time a business has been operating also positively impacts MSME income. The longer a business has been operating, the more experience, customer networks, and ability to adapt to the market its owners have. This makes the business more stable and consistently increases its income.
iv. The three independent variables (own capital, loan capital, and length of operation) simultaneously have a significant effect on MSME income. This means that a combination of sufficient own capital, loan support, and business experience will have a greater impact on MSME income growth than just one factor alone.

Abstract

This study analyses the simultaneous and partial effects of service quality and brand image on consumer purchasing decisions at Shell gas stations (SPBU). A quantitative approach was applied, using an online Google Forms survey administered to 105 respondents. The data were analysed using multiple linear regression in SPSS. The results indicate that service quality and brand image have a significant effect ($r^2 = 0.565$), explaining 56.5% of the variation in consumer purchasing decisions. However, when examined individually, only brand image has a significant impact ($p < 0.05$), while service quality does not. The results highlight the importance of strengthening the brand image as a priority for Shell to maintain and expand consumer loyalty.
Keywords: Service quality; Brand image; Purchase decision.

1. Introduction

Shell is known as one of the world's leading energy companies, originating from the Netherlands and the United Kingdom, operating under the full name Royal Dutch Shell plc. The company was founded in 1907 due to a merger between Royal Dutch Petroleum Company (Netherlands) and The Shell Transport and Trading Company Limited (United Kingdom). One of the key strategies for winning market competition is to improve service quality and build a strong brand image. In this context, companies need to understand the various factors that can influence consumer purchasing decisions at gas stations.
Service quality plays a key role in influencing customer satisfaction and purchasing decisions. It measures expected excellence and the ability to manage it to meet customer needs and expectations. Good service, such as speed of service, friendliness of staff, cleanliness of facilities, and clarity of information, creates a positive experience for customers, which in turn influences their purchasing decisions (Tjiptono, 2017).

A brand's image also plays an important role in influencing consumer choices. Brand image is the customers' perception and belief about a brand, which is formed through experience and marketing communications. As a global brand, Shell is known for its relatively good quality and environmentally friendly innovations. However, this perception may not be fully shared by all consumers in Indonesia, particularly among daily gas station users (Kotler & Keller, 2016). In marketing, consumer purchasing decisions are one of the main benchmarks for assessing the effectiveness of a company's strategy. Purchasing decisions are the stages that consumers go through before finally deciding to buy a product or service, and they are influenced by many factors, including perception, experience, and brand image (Schiffman & Kanuk, 2008).

In marketing, consumer purchasing decisions are one of the main benchmarks for assessing the effectiveness of a company's strategy. Purchasing decisions are the stages that consumers go through before finally deciding to buy a product or service, and they are influenced by many factors, including perception, experience, and brand image (Schiffman & Kanuk, 2008).

This research is important to address Shell's challenges in the dynamic Indonesian fuel market. It analyses the impact of service quality and brand image on purchasing decisions.

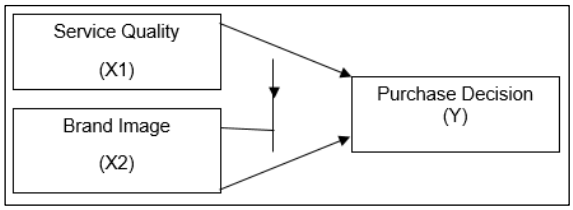

Fig.1. Framework of thinking

1. How does service quality affect consumer purchasing decisions at Shell gas stations?
2. How does brand image influence consumer purchasing decisions at Shell gas stations?
3. Do service quality and brand image simultaneously influence consumer purchasing decisions at Shell gas stations?

2. Methodology

The study was conducted between March and May 2025 using a quantitative approach. The research site was the Shell gas stations (SPBU) across Indonesia, focusing on customers who had used the service. The population comprised Shell SPBU customers across various regions, with a sample of 105 respondents selected through a non-probability accidental sampling technique via an online survey administered through TikTok. The data were collected using a structured questionnaire based on three indicators: Service Quality, Brand Image, and Purchase Decision, measured on a 5-point Likert scale. The instrument included questions on reliability, responsiveness, assurance, empathy, and tangibles for service quality; brand association, brand uniqueness, brand trust, and overall brand impression for brand image; and need recognition, information search, evaluation of alternatives, decision making, and post-purchase behaviour for the purchasing decision..

This study is a quantitative study using multiple linear regression analysis. The analysis was conducted using SPSS Statistics software to test the effect of independent variables (X1 = Service Quality and X2 = Brand Image) on the dependent variable (Y = Purchase Decision), both simultaneously and partially.

$$Y = a + b_1 X_1 + b_2 X_2 + e \quad (1)$$

Explanation:
Y = Purchase Decision
X_1 = Service Quality
X_2 = Brand Image
a = Constant
b_1, b_2 = Regression Coefficients
e = Error Term

Data was collected by distributing questionnaires to the research sample, namely Shell fuel consumers, during the abovementioned research period.

3. Results and Discussion

Respondent characteristics are the identities of respondents who were sampled for the study. The sample comprised 105 consumers who completed the questionnaire based on gender, age, and location. The following data presents the characteristics of the respondents:

Table 1. Characteristics by gender

No.	Gender	Frequency	Percentage (%)
1.	Male	40	38,1
2.	Female	65	61,9
Amount		105	100

Table 1 shows that 65 of the customers in this study were women (61.9%), and 40 were men (38.1%).

Table 2. Characteristics based on age

No.	Age	Frequency	Percentage (%)
1.	18-19 years old	3	3
2.	20-21 years old	24	23
3.	22-23 years old	61	58
4.	24-26 years old	17	16
Amount		105	100

Table 2 shows that most of the consumers in this study are aged 18-19, totalling three people (3%), 20-21, totalling 24 people (23%), 22-23, totalling 61 people (58%), and 24-26, totalling 17 people (16%).

Table 3. Characteristics based on location

No.	Location	Frequency	Percentage (%)
1.	North Sumatra	10	10
2.	West Java	32	28
3.	East Java	22	20
4.	Jakarta	41	42
Amount		105	100

Table 3 shows that most consumers are located in North Sumatra (10 people or 10%), West Java (32 people or 28%), East Java (22 people or 20%), and Jakarta (41 people or 42%).

Validity testing is conducted to determine the accuracy and precision of an instrument in performing its measurement function. In this study, validity testing aims to measure whether the items in the questionnaire can describe the variables being studied, namely Service Quality, Brand Image, and Purchase Decisions.
The testing was conducted using SPSS software and the Pearson Product-Moment correlation analysis method. A research result can be considered valid if the data obtained corresponds to the conditions or facts that occurred in the object being studied. According to Priadana and Sugiono (2021), an instrument can be considered valid if the rhitung value is greater than the rtabel value, while a r-count value smaller than the r-table value means the instrument is not valid.

In addition, the instrument also needs to be tested for reliability. An instrument is considered reliable if it can produce consistent data when used repeatedly to measure the same object. For example, a rubber ruler is considered unreliable (Priadana & Sugiono, 2021). For reliability testing, Cronbach's alpha is used, where a value greater than 0.60 indicates the instrument is reliable, while a value less than 0.60 means it is unreliable.

Table 4. Validity of the service quality variable instrument (X1)

Instrument	r_calculate	r_table	Conclusion
X1.1	0.546	0.361	Valid
X1.2	0.53	0.361	Valid
X1.3	0.569	0.361	Valid
X1.4	0.509	0.361	Valid
X1.5	0.454	0.361	Valid

X1.6	0.724	0.361	Valid
X1.7	0.623	0.361	Valid
X1.8	0.607	0.361	Valid
X1.9	0.723	0.361	Valid
X1.10	0.444	0.361	Valid

Based on Table 4 above, most instrument items for the Service Quality variable (X1) have a rhitung value greater than 0.361. This indicates that all statement items for the Service Quality variable (X1) can be declared valid.

Table 5. Validity of brand image variable instrument (X2)

Instrument	r_calculate	r_table	Conclusion
X2.1	0.514	0.361	Valid
X2.2	0.522	0.361	Valid
X2.3	0.729	0.361	Valid
X2.4	0.557	0.361	Valid
X2.5	0.604	0.361	Valid
X2.6	0.524	0.361	Valid
X2.7	0.268	0.361	Invalid
X2.8	0.541	0.361	Valid
X2.9	0.651	0.361	Valid
X2.10	0.618	0.361	Valid

Table 5 above shows that the test results for most of the Brand Image (X2) variable instruments have a rhitung value > 0.361. Thus, it can be concluded that the statement instruments of the Brand Image (X2) variable used are valid, and only the seven statement instruments are declared invalid.

Table 6. Validity of the purchase decision (Y) variable instrument

Instrument	r_calculate	r_table	Conclusion
Y1	0.428	0.361	Valid
Y2	0.546	0.361	Valid
Y3	0.587	0.361	Valid
Y4	0.531	0.361	Valid
Y5	0.597	0.361	Valid
Y6	0.394	0.361	Valid
Y7	0.655	0.361	Valid
Y8	0.415	0.361	Valid
Y9	0.650	0.361	Valid
Y10	0.616	0.361	Valid

Based on the data in Table 6 above, most of the instrument items for the Purchase Decision (Y) variable have a rhitung value greater than 0.361. Thus, it can be concluded that all statement items for the Purchase Decision (Y) variable are valid.

Table 7. Research instrument reliability results

Variable	Cronbach's alpha Calculate	Cronbach's alpha Tolerance	Conclusion
Service Quality (X1)	0.771	0.60	Reliable
Brand Image (X2)	0.746	0.60	Reliable
Purchase Decision (Y)	0.733	0.60	Reliable

The reliability test results indicate that Cronbach's alpha value exceeds 0.60, suggesting that this research questionnaire is reliable. This test was conducted to determine the effect of service quality and the Shell fuel brand image on consumer purchasing decisions at public

fuel filling stations (SPBU). The following table shows the results of multiple linear regression testing on each variable:

Table 8. Multiple linear regression results

Model		Unstandardised Coefficients		Standardised Coefficients	T	Sig.
		B	Std. Error	Beta		
1	(Constant)	10.658	3.042		3.503	.001
	Service Quality	-.049	.064	-.060	-.777	.439
	Brand Image	.805	.080	.783	10.064	.000

Based on the results of the analysis, the multiple linear regression equation can be formulated as follows:

$$Y = 10.658 - 0.049X1 + 0.805X2 \quad (2)$$

The multiple linear regression model's constant value for purchase decisions is 10.658. This indicates that Service Quality and Brand Image have a value of 0, so the average value of the dependent variable (Y) is estimated at 10.658. The regression coefficients for each independent variable are negative for X1 (-0.049) and positive for X2 (0.805), meaning that only the Brand Image (X2) variable influences the decision to purchase Shell fuel.

Table 9. Results of the coefficient of determination (R2) test

Model Summary				
Model	R	R Square	Adjusted R Square	Std. Error of the Estimate
1	.752[a]	.565	.556	2.702

The coefficient of determination value of 0.565 or 56.5% indicates that the variables of service quality and brand image can explain the variation that occurs among Shell fuel consumers in Indonesia. Meanwhile, the remaining 43.5% is attributed to other variables that fall outside the scope of this study.

A simultaneous test (F-test) was conducted to determine the influence of service quality and brand image on purchasing decisions. The test was conducted at a confidence level of 95% or an error rate of α=0.05% with the criteria.

1. If fcount ≤ ftable, then H0 is accepted, H1 is rejected, meaning that simultaneously this study has no effect.

2. If fcount > ftable, then H0 is rejected, H1 is accepted, meaning that this study has a simultaneous effect.

Table 10. Simultaneous test results (F Test)

Model		Sum of Squares	df	Mean Square	F	Sig.
1	Regression	966.705	2	483.352	66.181	.000[b]
	Residual	744.953	102	7.303		
	Total	1711.657	104			

Based on the results of the ANOVA test in the table, the F value of 66.181 with significance (Sig.) 0.000 < 0.05 indicates that the regression model used is statistically significant. This means that the independent variables collectively have a significant effect on the dependent variable. The regression Sum of Squares value of 966.705 describes the variation in data that the model can explain, while the residual Sum of Squares of 744.953 reflects the variation that cannot be explained by the model. Thus, the regression model tested is suitable for predicting the dependent variable in this study.

Partial test (t-test) aims to see the effect of service quality and brand image on purchasing decisions, with the following criteria:

1. If tcount ≤ ttable, then H0 is accepted, H1 is rejected, meaning that this study has no partial effect;

2. If tcount ≥ ttable, then H0 is rejected, H1 is accepted, meaning that this study has a partial effect.

Table 11. Partial test results (t-test)

Model		Unstandardized Coefficients		Standardized Coefficients	t	Sig.
		B	Std. Error	Beta		
1	(Constant)	10.658	3.042		3.503	.001
	Service Quality	-.049	.064	-.060	-.777	.439
	Brand Image	.805	.080	.783	10.064	.000

Based on the table, it can be seen that:

1. The t-value for service quality is -0.777 < 1.983, so H0 is accepted, meaning that service quality does not have a significant partial effect on purchasing decisions.
2. The t-value for brand image is 10.064 > 1.983, so H0 is rejected, meaning that brand image has a significant partial effect on purchasing decisions.

4. Conclusion

Based on the results of the data analysis in this study, it can be concluded that in terms of service quality (X1), the majority of respondents gave positive responses, with 90% agreeing or strongly agreeing with statements reflecting the facilities, services, and cleanliness of Shell gas stations. However, in the multiple linear regression test and t-test (partial), the service quality variable was found to have no significant effect on purchasing decisions (significance value 0.439 > 0.05 and t-calculated -0.777 < t-table 1.983). Conversely, brand image (X2) also received very positive ratings from respondents, averaging 89% agreeing or strongly agreeing. Regression analysis showed that only brand image had a significant influence on purchasing decisions, with a positive coefficient value of 0.805 and a significance level of 0.000. The results of the simultaneous test (F test) show that both independent variables (service quality and brand image) together have a significant effect on purchasing decisions, with an F-count value of 66.181 > F-table and a significance value of 0.000 < 0.05. The coefficient of determination (R^2) value of 0.565 indicates that these two variables can explain 56.5% of the variability in Shell fuel purchasing decisions, while other factors outside the research model explain the remaining 43.5%. These results reinforce that although service quality does not have an individual effect, its presence still contributes when combined with brand image in influencing consumer decisions.

Abstract

This study aims to examine the influence of digital marketing strategy and product quality on sales growth among micro, small, and medium enterprises (MSMEs). The development of information and communication technology has enabled MSME to adopt digital marketing strategies to improve sales performance. This study addresses the need to understand the key factors that supports sales growth of MSMEs in the digital era. In addition, product quality is considered an important factor in attracting customers and maintaining market share. This research employs a quantitative approach using multiple linear regression analysis.
The results indicate that digital marketing strategy has a significant partial effect on sales growth ($t = 5.250$; $p < 0.001$), whereas product quality does not have a significant partial effect ($t = 1.232$; $p = 0.227$). Simultaneously, the two variables have a significant effect on sales growth ($F = 267.734$; $p < 0.001$). The coefficient of determination (R^2) is 0.942, indicating that the model provides a very strong explanation of the variance in the dependent variable. The model also satisfies classical assumption tests, including normality, absence of multicollinearity, and absence of heteroscedasticity. These findings suggest that digital marketing strategy is a key factor in driving sales growth among MSME or SME. (inconsistent terminology) whereas product quality alone does not have a significant impact on sales growth in this context.
Keywords: Digital Marketing Strategy; Product Quality; Sales Growth

1. Introduction

Frozen Food Mamak is a local small and medium enterprises (SMEs) engaged in the frozen food sector, oriented toward household and student market. Along with the increasing need for instant, practical, and durable food, frozen food products are increasingly in demand by various levels of society. Changes in urban lifestyles and the high mobility of modern society leadconsumers to choose ready-to-eat foods. This phenomenon creates significant opportunities for business such as Frozen Food Mamak. However, this high demand has not been matched by an integrated and sustainable marketing and product quality management strategy. Many MSMEs only focus on production, without developing a systematic approach to the digital market and customer satisfaction.

Based on observations, Frozen Food Mamak has relied on conventional marketing strategies such as word-of-mouth recommendations, peer-to-peer promotions, and occasional social media posts without careful planning. In fact, the digital ecosystem provides great potential to reach a wider market quickly and cheaply. Changes in people's consumption patterns since the COVID-19 pandemic have prompted consumers to switch to online purchases for food, including frozen food. Research by Rezky et al. (2003) shows that consumers purchase of frozen food products via online platforms has increased significantly. However, MSMEs that have not adopted digital marketing systematically will lag behind competitors, especially in terms of reach and brand perception.

On the other hand, product quality plays a vital role in retaining and attracting new customers. In the frozen food industry, factors such as taste, texture, colour, packaging, and product durability are very important. MSMEs such as Frozen Food Mamak often ignore the importance of quality standardization, both in the production and packaging processes. According to (Suryanti, 2021), consistently poorly product quality can lead to customer dissatisfaction, which ultimately affects repurchase decisions. Therefore, business development strategies should not rely solely on digital marketing, but also they need to be supported by a planned and measurable quality management system. The combination of the two forms an important foundation for driving continuous sales increase.

A study by (Lestari et al., 2022) examining the influence of product quality and price perception on sales through digital marketing provides an important insight into the relationship between variables. However, their focus is still limited to the food industry in general, not to frozen food. In addition, their approach does not highlight the special characteristics of household-scale MSMEs such as Frozen Food Mamak, which has limited resources but is flexible in product innovation and distribution.

This research developed a quantitative model to analyse the influence of digital marketing strategies and product quality on sales. t This research used a case study of Frozen Food Mamak, providing a realistic and relevant picture of the conditions faced by MSMEs in the field. . Therefore, the results of this study are not only theoretical but also practical and can be directly applied by business owners, particularly in the frozen food sector

The findings of this study are expected to make a practical contribution in designing marketing strategies that are more effective and oriented to the needs of digital consumers. With measurable research results, Frozen Food Mamak and similar MSME can develop targeted promotional plans and improve product quality based on direct market input. This will accelerate their adaptation to the changing dynamic digital business environment.

Thus, the main purpose of this study is to analyze and demonstrate empirically that digital marketing strategies and product quality have a significant influence on it the sales growth of frozen food MSMEs. This research is also expected to make a real contribution to the development of science in the field of MSME marketing management and more sustainable business practices at the local community level.

2. Methodology

This study uses a quantitative approach with associative and cross-sectional design. The quantitative approach was chosen because it allows researchers to objectively measure and analyze the relationships between variables through numerical data. The cross-sectional design was chosen because the data were collected at a single point in time, without repeated observations. This study is associative, because it aims to determine the simultaneous and partial influence between independent and dependent variables.

The independent variables in this study consisted of:
X_1 = Digital Marketing Strategy
X_2 = Product Quality

While the dependent variables:
Y = Increase in Sales

This research was conducted t MSME Frozen Food Mamak, with respondents being consumers who had made at least two purchases. The total sample of 50 respondents was obtained through purposive sampling, using a digital questionnaire (Google Form).

The questionnaire was compiled based on indicators from each variable that had been validated in previous research. Each statement item was measured using a 5-point Likert scale, ranging from "Strongly Disagree" (1) to "Strongly Agree" (5). Before use, the questionnaire was tested for validity and reliability.

The data obtained from the questionnaire were analyzed using multiple linear regression to find out:
The simultaneous influence of X_1, X_2, on Y,
The partial influence of each independent variable on the dependent variable.

a Population and sample

The population in this study includes all MSME in the culinary sector who actively use social media as the main means of marketing their products, especially those operating in Medan City area, North Sumatra Given the large number of MSMEs and wide geographical conditions, this study is focused on one business unit as a case study, namely MSMEs Frozen Food Mamak, which is located on Jalan Pelita VI, Medan Perjuangan District. This business unit was chosen because it consistently utilizes digital marketing strategies and has active consumers with repeat purchase rates, making it relevant to the research to the objectives

The sampling technique used is purposive sampling, a deliberate selection method based on certain criteria relevant to the needs of the research. In this context, only respondents with direct experience of digital marketing aspects, product quality, and service innovation were involved so that the data generated are valid, focused, and in accordance with the research context.

The number of 50 respondents was considered optimal for the quantitative approach because it provided a sufficient basis for statistical analysis, especially multiple linear regression, which requires the representation of data from _multiple perspectives. . This sample size is expected to be able to provide an accurate empirical picture of the relationship between the variables studied, as well as produce findings that can be used as a basis for strategic decision-making for the development of MSME businesses in the frozen food sector.

b Variable Operational Definition

The following operational definitions of variables are designed to provide a clear measurement of the research variables.

Table 1. Operational definitions of variables

Variabel	Dimension	Indicator	Measurement Scale
Digital Marketing (X1)	Google Business for Visibility	Completeness of your Google Business profile and easy access to location, business hours, contact information	Likert (1–5)
	Local Marketing	Leveraging Google Business to reach local consumers and promote through Google Posts	Likert (1–5)
	Customer Reviews Management	Demand for positive reviews, and the influence of reviews on purchase decisions	Likert (1–5)
	Analytics & Performance Measurement	Use Google Business analytics data to monitor performance and adjust marketing strategies	Likert (1–5)
	Ads Feature Utilization	Use of Google Ads advertising features to increase product reach and promotion	Likert (1–5)

Product Quality (X2)	Product Performance	Taste suitability, quality, and ease of preparation of products	Likert (1–5)
	Product Reliability	Availability of the product in good condition and free of damage	Likert (1–5)
	Product Durability	Durability of the product during storage in the freezer	Likert (1–5)
	Product Design	Attractive, informative, easy to open and maintain freshness	Likert (1–5)
	Ease of Use	Clear and easy-to-follow instructions for consumers	Likert (1–5)
Sales Increase (Y)	Sales Promotion Strategy	The use of discounts, bundling, coupons, and their effect on increased purchases	Likert (1–5)
	Social Media Marketing	Promotional activities on social media and their impact on customer reach	Likert (1–5)
	Customer Reviews	The use and influence of customer reviews on digital platforms on purchases	Likert (1–5)
	Data-driven Marketing & Analytics	Use of customer data and digital analytics in the evaluation and improvement of marketing strategies	Likert (1–5)
	Paid Ads	Use of paid advertising to expand the market and increase product visibility	Likert (1–5)

c Data Collection Techniques

The data collection technique was carried out using primary data The primary data in this study was obtained from 50 respondents of Frozen Food Mamak consumers who were selected purposively, with the main criterion being that they had made purchases at least twice. These criteria are used to ensure that respondents have sufficient experience and knowledge in evaluating aspects of products and services. Data collection was carried out online through the questionnaires administered via Google Forms.

d Data Analysis Techniques

Data obtained from 50 Frozen Food Mamak consumer were processed and analyzed using SPSS software, with several stages of analysis to ensure validity, reliability, and to test the relationship between the variables studied. This technique was used to answer research questions regarding the influence of digital marketing strategy (X_1) and product quality (X_2) on sales growth (Y).

e Location and Time of the study

The research was conducted at MSMEs Frosen Food Mamak, which is located at JL. Pelita VI, Medan Perjuangan District, Medan City, North Sumatra. Data collection was carried out from March to May 2025

3. Results and Discussion

a. Classic Assumption Test

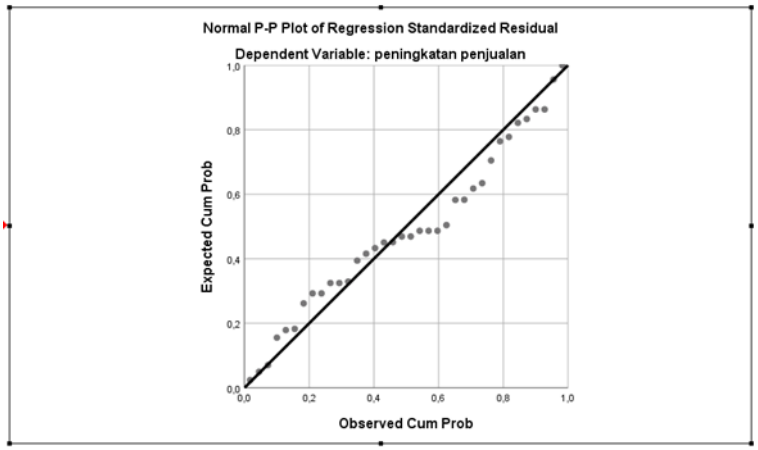

Fig. 1. Normality test

For the Kolmogorov–Smirnov normality test, the test statistic must have a p-value greater than 0.05, indicating that the data can be considered normal.

One-Sample Kolmogorov-Smirnov Test

		Unstandardized Residual
N		36
Normal Parameters[a,b]	Mean	,0000000
	Std. Deviation	2,30559033
Most Extreme Differences	Absolute	,134
	Positive	,134
	Negative	-,093
Test Statistic		,134
Asymp. Sig. (2-tailed)		,098[c]

a. Test distribution is Normal.
b. Calculated from data.
c. Lilliefors Significance Correction.

Fig. 2. NPar test

Based on the Kolmogorov–Smirnov normality test, an Asymp. Sig. (2-tailed) value of 0.098 was obtained.

b. Hypothesis Test

Table 1. Coefficient of hypothesis test

Model	B	Std. Error	Beta	t	Sig.
(Constant)	-4.719	2.058		-2.293	.028
strategi digital marketing	.895	.170	.791	5.250	.000
kualitas produk	.216	.176	.186	1.232	.227

Based on SPSS version 25 output, the multiple linear regression produced a constant of −4.719, a digital marketing coefficient of 0.895, and a product quality coefficient of 0.216. The regression equation is:

Formula:

$$Y=-4.719+0.895X1+0.216X2 \quad (1)$$

The multiple regression results can be interpreted as follows:

a. The value of the constant = -4.719 which means that if the Digital Marketing variable(X1) and the Product Quality variable(X2) are zero-0, then the dependent variable(Y) remains valued at -4.719.
b. The value of the coefficient of the Digital Marketing variable (X1) has a positive value of 0.895 which means that if the Digital Marketing variable (X1) increases, while other independent variables remain constant, the dependent variable (Y) will increase by 0.895
c. The value of the coefficient of the Product Quality variable (X2) has a positive value of 0.216 which means that if the Product Quality variable (X2) increases, while other independent variables remain constant, the variable (Y) will increase by 0.216

c. Determination Coefficient Test (R Square)

Table 2. Coefficient test of R square

Model	R	R Square	Adjusted R Square	Std. Error of the Estimate
1	.971[a]	.942	.938	2.374

R Square (R^2) = 0.942. This means that 94.2% of the variation in the dependent variable (increase in sales) can be explained by two independent variables used in the model, namely digital marketing strategy and product quality.

Adjusted R^2 = 0.938. Adjusted R^2 provides an adjustment to the number of independent variables used. This value is also high, indicating that the regression model remains robust and that no overfitting occurs despite the presence of two predictors.

Standard Error of the Estimate = 2.374. This indicates the degree to which the predicted value deviates from the actual value. The smaller this value, the better the model is at predicting the data.

The determination coefficient of 94.2% indicates that this regression model has a very strong ability to explain the variable of sales increase. This means that digital marketing strategies and product quality, together, have a significant influence on increasing sales. The remaining 5.8% is attributed to other variables outside this model.

b. Simultaneous Determination Coefficient

Table 3. Coefficient test of simultaneous

Model	R	R Square	Adjusted R Square	Std. Error of the Estimate
1	.971[a]	.942	.938	2.374

It is known that based on table VI.23 the value of the Adjusted R square is 0.938, it is concluded that the contribution of the influence of independent variables on the dependent variables simultaneously or jointly is 93.8%,

c. Partial T test

Table 4. Coefficient of partial T test

Model	Unstandardized Coefficients (B)	Std. Error	Standardized Coefficients (Beta)	t	Sig.	
1	(Constant)	-4.719	2.058		-2.293	.028
	strategi digital marketing	.895	.170	.791	5.250	.000
	kualitas produk	.216	.176	.186	1.232	.227

The t-test results indicate that only the digital marketing strategy variable has a significant effect on sales growth. Meanwhile, product quality did not have a significant partial effect in this regression model.

d. Simultaneous F–test

Table 5. Coefficient of partial F test

Model	Sum of Squares	df	Mean Square	F	Sig.
Regression	3018,921	2	1509,461	267,734	,000
Residual	186,051	33	5,638		
Total	3204,972	35			

The value of Sig. = 0.000, much smaller than 0.05. This means that the regression model is jointly significant, indicating that digital marketing strategy and product quality together have a significant effect on sales growth.

Based on the results of ANOVA's analysis, an F value of 267.734 was obtained with a significance value (Sig.) of 0.000. Since the significance value is smaller than the significance level of 0.05, it can be concluded that the regression model is simultaneously significant.
In other words, digital marketing strategy and product quality together have a significant influence onsales growth. This shows that the regression model used in this study is feasible and reliable for explaining the variations in the sales growth variable.

4. Conclusion

Frozen Food Mamak is an example of a frozen food MSME facing the demands of an increasingly digital market. Demand for convenient food products has indeed increased rapidly, but many businesses still rely on conventional marketing methods without an integrated strategy. However, post-pandemic consumer behavior has driven a shift to online purchasing, creating significant digital market potential. This study aimed to examine the influence of digital marketing strategies and product quality on sales growth.

The results showed that the hypothesis regarding the influence of digital marketing strategies was confirmed, whereas the hypothesis regarding the influence of product quality was only partially supported. In other words, digital marketing strategies played a significant role in increasing Frozen Food Mamak's sales growth. Product quality, while important for customer satisfaction, did not show a significant effect separately in this regression model. However, both variables simultaneously had a significant impact on sales. This finding confirms that the implementation of digital marketing strategies is a key factor in driving MSME sales growth in the study context, while quality improvement remains crucial within an overall strategy framework.

Practically, the findings of this study provide concrete contributions to frozen food MSMEs. With a deeper understanding of the influence of digital marketing and product quality, Frozen Food Mamak and similar businesses can design targeted online promotional plans and improve product quality based on market feedback. This approach accelerates business adaptation to the dynamics of the digital environment and enriches the development of MSME marketing management knowledge at the local level.

THE INFLUENCE OF SOCIAL MEDIA PROMOTION AND CONSUMER REVIEWS ON PURCHASING DECISIONS ON FASHION PRODUCT PURCHASE FOR GEN Z IN MEDAN

Nadya Amanda Br Barus*, Sixson Roberto Simangunsong

Manajemen Pemasaran, Sekolah Tinggi Ilmu Manajemen Sukma, 20219 Kota Medan, Sumatera Utara, Indonesia

*Corresponding author e-mail address: nadyaamandabarus@gmail.com

Abstract

The purpose of this study is to ascertain how social media promotion affects Generation Z's decisions to buy fashion products, how consumer reviews affect Gen Z's decisions to buy fashion products, and how social media promotion and consumer reviews work together to affect Gen Z's decisions to buy fashion products in Medan City. The study uses an associative descriptive methodology and is quantitative in nature. There are 89,589 members of the Gen Z population in Medan, and 100 respondents' responses were collected through purposive sampling techniques. A Likert scale-based questionnaire was used to gather the data, and t-tests, F-tests, multiple linear regression analysis, validity, reliability, and traditional assumption tests were used for analysis. The findings show that Gen Z fashion product purchasing decisions in Medan City were positively and significantly impacted by social media promotion (X_1), with a t-count value of 6.042> t-table 1.66071 and a significance level of 0.000 <0.05. Attractive social media promotions can lead to more purchases, according to the regression coefficient of 0.582. Additionally, t-count 4.758> t-table 1.66071, significance 0.000 <0.05, and a regression coefficient of 0.426 show that Consumer Reviews (X_2) also have a positive and significant influence, indicating that favourable customer reviews reinforce purchase decisions. With an F-count value of 160.328> F-table 3.09, significance 0.000, and an R2 value of 0.768, both variables concurrently have a significant impact on purchasing decisions. This indicates that social media promotions and customer reviews account for 76.8% of the variables that influence purchasing decisions.
Keywords: Social media promotion; Consumer reviews; Purchasing decisions.

1. Introduction

Korean fashion products are experiencing a surge in popularity in Indonesia, especially among Gen Z, because the design is unique, modern, and in line with the trend of Korean pop culture, such as K-pop and Korean dramas (Asia Commerce, 2025). Korean Wave, or Hallyu, has expanded its influence on music entertainment and the fashion industry, where Korean celebrities have become a reference for young adults (W. Wicaksono, 2021). Fashion is also becoming a means of expressing self and social identity, influencing lifestyle and decision-making, and influencing Gen Z consumption (Nurcaya, 2021). Social media has become a primary channel for Korean fashion promotion. Platforms like Instagram and TikTok allow brands to showcase products visually and interactively, forming a positive perception and attracting Gen Z attention (Aprianti, 2021). Packaged promotions in a creative way on social media have proven capable of influencing purchase decisions, because consumers feel more connected with products viewed directly in everyday activities (MI Sari and PH Heng, 2024).

Consumer reviews also play an important role in the decision-making process. Consumers tend to trust experienced buyers because reviews are considered more objective than advertisements. Positive reviews increase trust, whereas negative reviews can lower interest in buying (Sujarweni, 2022) (Sagia, 2023). In the Korean fashion context, many consumers depend on online testimonials before making a purchase (Nurmalasari, 2022).

The results of a pre-survey of 30 Gen Z respondents in Medan showed that once they see Korean fashion promoted on social media, they will likely be interested in buying the product. Most respondents mentioned that they would read the product's reviews before buying and stated that positive reviews would influence their buying decisions. This shows that social media promotion and customers' reviews can influence significant decisions to purchase Korean fashion products. Based on the pre-survey results, the researchers were interested in researching how social media promotion and consumer reviews influence Gen Z purchase behaviour in Medan.

2. Methodology

This study uses a purposeful quantitative approach to test the influence of social media promotion and consumer reviews on the decision to purchase Korean fashion products among Gen Z in Medan (Sinambela, 2020), (Bougie, 2021). The study was conducted from May to June 2025 in Medan. The study population was Gen Z, aged 18-25, who are active in social media and have purchased Korean fashion products at least once.

One hundred respondents were selected using purposive sampling, a non-probability sampling method, based on certain criteria (Bahri, 2021) , (Sugiyono, 2022). The primary data was a questionnaire distributed personally and online. The Likert scale uses a five-point scale from "strongly disagree" to "strongly agree" to evaluate respondents' perceptions of the variables in the research (Ghozali, 2020). Test validity was conducted to ensure the instrument could measure what it should be measuring, whereas Cronbach's Alpha was used to measure the reliability. Cronbach's alpha values range from 0 to 1. A higher value indicates greater internal consistency. Typically, values above 0.7 are considered acceptable (Tham, 2021).

Before doing the regression analysis, test assumptions classic consisting of test normality (using Kolmogorov-Smirnov), test heteroscedasticity (with scatter plot), and test multicollinearity (with tolerance value and VIF) (Keller, 2020), (Solomon, 2022). A multiple linear regression model was used to predict the influence of social media promotion (X1) and consumers' reviews (X2) towards purchase decision (Y), with equation $Y = \alpha + \beta1X1 + \beta2X2 + e$ (Tham, 2021) (Bahri, 2021). Hypothesis testing was conducted using a t-test to determine how each independent variable partially influences the outcome and an F-test to assess the simultaneous influence. The coefficient of determination (R^2) measures how well a statistical model predicts an outcome, represented by the model's dependent variable (Keller, 2020).

3. Results and Discussion

One-Sample Kolmogorov-Smirnov Test		
		Unstandardized Residual

Asymp. Sig. (2-tailed)		.200[c]
a. Test distribution is Normal.		
b. Calculated from data.		
c. Lilliefors Significance Correction.		

Fig.1. Kolmogorov-Smirnov Normality Test Result

The One-Sample Kolmogorov-Smirnov test results above show that the residual data is normally distributed with a significance value of 0.200 (>0.05). Therefore, the normality

assumption is met, and the data can be analysed using regression or other parametric statistical tests.

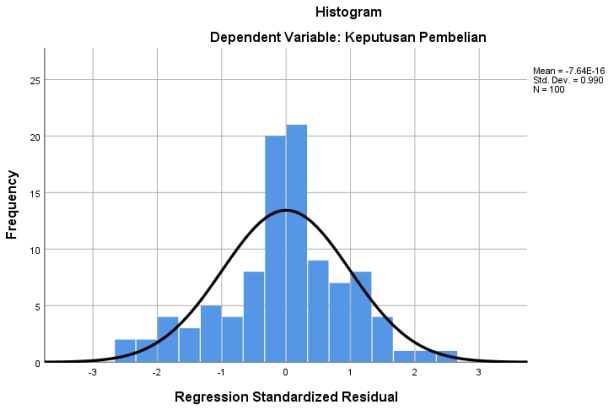

Fig. 2. Histogram of Normality Test Results

The histogram above shows that the distribution of regression standardised residuals for the purchase decision variable is close to the normal curve shape. This indicates that the residual data is normally distributed, so the normality assumption is met and the regression model is suitable for further analysis.

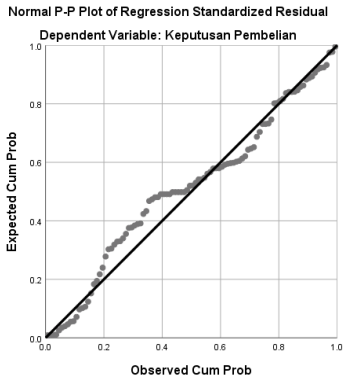

Fig. 3. P-Plot Normality Test Results

Figure 3 shows a Normal PP Plot of regression standardised residuals for the purchase decision dependent variable. The dots on the graph mostly follow the diagonal line, which indicates that the residual distribution is close to a normal distribution. This supports the assumption of normality in regression analysis, so the regression model can be considered valid for further testing.

Table 2. Glejser test for Heteroscedasticity Result

Coefficients[a]

Model		Unstandardized Coefficients		Standardized Coefficients		
		B	Std. Error	Beta	T	Sig.
1	(Constant)	6.565	1.381		4.754	.420
	Promosi Di Media Sosial	-.188	.061	-.511	-3.067	.103
	Ulasan Konsumen	.094	.057	.275	1.650	.102

a. Dependent Variable: ABS_RES

The results of the heteroscedasticity test using regression analysis show that the values (Sig.) for the social media promotion variables and consumer reviews are both significant and greater than 0.05. Thus, it can be concluded that there are no symptoms of heteroscedasticity

in the model. This means that the residual variance is constant, and the regression model fulfils the assumption of homoscedasticity.

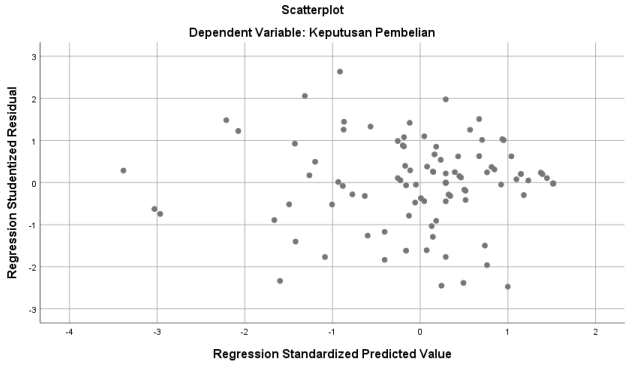

Fig. 3. *Scatterplot* Heteroscedasticity Test Result

The scatterplot shows that the points spread randomly and do not form a certain pattern (for example, a widening or narrowing spread pattern). This random distribution pattern indicates that the residual variance is constant or that homoscedasticity is fulfilled

Table 3. Multicolinearity Test Result

Coefficients[a]								
		Unstandardized Coefficients		Standardized Coefficients			Collinearity Statistics	
Model		B	Std. Error	Beta	T	Sig.	Tolerance	VIF
1	(Constant)	-.298	2.167		-.137	.891		
	Promosi Di Media Sosial	.582	.096	.514	6.042	.000	.331	3.020
	Ulasan Konsumen	.426	.089	.405	4.758	.000	.331	3.020
a. Dependent Variable: Keputusan Pembelian								

The multicollinearity test results show that the tolerance value for social media promotion and consumer reviews is 0.331, and the VIF value for both is 3.020. As the tolerance value is> 0.10 and the VIF is < 10, it can be concluded that there is no multicollinearity in the regression model. This means that the two independent variables do not have a high correlation and are suitable for further analysis.

Table 4. Multiple Linear Regression Analysis

Coefficients[a]						
		Unstandardized Coefficients		Standardized Coefficients		
Model		B	Std. Error	Beta	t	Sig.
1	(Constant)	-.298	2.167		-.137	.891
	Promosi Di Media Sosial	.582	.096	.514	6.042	.000
	Ulasan Konsumen	.426	.089	.405	4.758	.000
a. Dependent Variable: Keputusan Pembelian						

The multiple linear regression results show the equation:
Y = -0.298 + 0.582X, + 0.426X2, which means that social media promotion (X_1) and Consumer Reviews (X_2) have a positive effect on Purchasing Decisions (Y). The coefficient value of X_1 is 0.582. Both variables are statistically significant because they have a substantial value of 0.000 (<0.05), while the constant of -0.298 is not significant (sig 0.891), so its contribution to the model is less meaningful.

Table 5. Partial Hypothesis Test Results (t-test)

Coefficients[a]						
Model		Unstandardized Coefficients		Standardized Coefficients	t	Sig.
		B	Std. Error	Beta		
1	(Constant)	-.298	2.167		-.137	.891
	Promosi Di Media Sosial	.582	.096	.514	6.042	.000
	Ulasan Konsumen	.426	.089	.405	4.758	.000
a. Dependent Variable: Keputusan Pembelian						

a) Promotion on Social Media (X_1)
The Promotion on Social Media variable has a t-count value of 6.042 and a t-table value of 1.66071. This variable has a significant impact on purchasing decisions since t-count> t-table (6.042> 1.66071). Furthermore, since the significance value of 0.000 is less than 0.05, social media promotion significantly and favourably influences purchasing decisions. As a result, H1 is accepted and H0 is rejected.

b) Review Consumers (X_2)
The Consumer Reviews variable has a t-count value of 4.758 and a t-table value of 1.66071. This variable also significantly influences purchasing decisions because t-count > t-table (4.758 > 1.66071). The conclusion that consumer reviews have a positive and significant influence on purchasing decisions is further supported by the significance value of 0.000, which is less than 0.05. Consequently, H2 is accepted and H0 is rejected.

Table 6. Simultaneous Significant Test Results (F-test)

ANOVA[a]						
Model		Sum of Squares	df	Mean Square	F	Sig.
1	Regression	6701.938	2	3350.969	160.328	.000[b]
	Residual	2027.372	97	20.901		
	Total	8729.310	99			
a. Dependent Variable: Keputusan Pembelian						
b. Predictors: (Constant), Ulasan Konsumen, Promosi Di Media Sosial						

The results of the F test show that the F-count value of 160.328 is greater than the F-table of 3.09, and the significance value is 0.000 <0.05. This suggests that, simultaneously, social media promotion and consumer reviews have a significant impact on purchasing decisions. Thus, the regression model is feasible, and the alternative hypothesis (H_a) is accepted.

Table 7. Results of the Coefficient of Determination (R^2)

Model Summary				
Model	R	R Square	Adjusted R Square	Std. Error of the Estimate
1	.876[a]	.768	.763	4.57173
a. Predictors: (Constant), Ulasan Konsumen, Promosi Di Media Sosial				

According to the Model Summary output, a strong correlation exists between social media promotion and customer reviews when making purchases, as indicated by the R value of 0.876. With an R Square value of 0.768, these two variables account for 76.8% of the variation in purchasing decisions, with other factors outside the model influencing the remaining 23%. Since the Standard Error of the Estimate value of 4.57173 indicates a low error rate and the

Adjusted R Square value of 0.763 strengthens the model's predictive power, the model is considered.

1. The Influence of Social Media Promotion on Purchase Decisions
This study reveals that social media promotion positively and significantly impacts the purchase decisions of fashion products among Generation Z in Medan. This generation is closely connected to digital technology and spends a considerable amount of time on social media, making them more receptive to promotional content that is visually and audibly engaging (Aprianti, 2021). Social media promotion also allows for flexible outreach using personalised approaches. Content such as influencer reviews, short videos, or promotional stories tailored to the Gen Z lifestyle can create emotional engagement that leads to stronger purchase intent (MI Sari and PH Heng, 2024). In modern marketing, social media is an information channel and a persuasive tool that shapes consumer perception and preference. Previous studies have confirmed the effectiveness of social media as a promotional medium that enhances brand awareness and influences purchase actions.

2. The Influence of Consumer Reviews on Purchase Decisions
Consumer reviews have been shown to significantly influence purchasing decisions, as indicated by the t-test results in this study, where the t-value greatly exceeded the critical value and the significance level was well below 0.05. Consumer reviews act as social proof, boosting potential customers' confidence in a product or service. Gen Z frequently seeks user reviews through digital platforms before purchasing (Sagia, 2023). This behaviour aligns with consumer behaviour theory, which explains that external influences, such as the opinions of others, play a crucial role in shaping purchasing behaviour. Rather than being supplementary, consumer reviews have become a critical factor in determining how products are perceived and ultimately purchased (Nurmalasari, 2022)].

3. The Simultaneous Influence of Promotion and Consumer Reviews on Purchase Decisions
The F-test results in this study show that social media promotion and consumer reviews collectively significantly impact the purchase decisions of fashion products among Gen Z consumers. Promotions help build product appeal, while consumer reviews reinforce trust by lowering perceived risk and hesitation. Together, these elements complement one another and strengthen consumers' final decisions to purchase (al, 2021). With social media enabling direct interaction between consumers and brands, and the presence of user-generated reviews, a digital ecosystem emerges that effectively supports purchase decisions. The electronic word-of-mouth (e-WOM) model is particularly relevant to the digital behaviour patterns of Generation Z (Aprianti, 2021).

4. Conclusion

Based on the result analysis that has been discussed, it can be concluded that social media promotion (X_1) has a positive and significant influence on the decision to purchase Korean fashion products by Gen Z in Medan. This was proven with a t-value of 6,042, which is much bigger than the t-table 1,66071, and significance of 0.000 < 0.05. Coefficient regression of 0.582 shows that the more interesting and intensive promotion through social media, the higher the tendency of Gen Z to make a purchase decision. Consumers' review (X_2) also proved significantly influential, with a t-count of 4.758 > 1.66071 and significance 0.000 < 0.05, and a regression coefficient of 0.426, which indicates that a positive review from consumers can push a decision to purchase. Simultaneously, both variables have a significant influence on the decision to purchase, as shown by the F-value calculated at 160.328, which far exceeds the F-table value of 3.09 with significance of 0.000. The R Square value of 0.768 indicates that 76.8% of the variation in purchase decisions can be explained by social media promotion and consumer reviews, while other variables outside of this study influenced the rest.

THE INFLUENCE OF SERVICE QUALITY, PRODUCT QUALITY ON CUSTOMER SATISFACTION AT INDOMARET WAHIDIN

William William, Anggia Arif*

International Marketing Management Study Program, Cendana Polytechnic, 20153 Medan, North Sumatra, Indonesia

*Corresponding author e-mail address: arifanggia13@gmail.com

Abstract

This study aims to find out whether Service Quality and Product Quality Affect Customer Satisfaction at Indomaret Wahidin. This research method uses a quantitative research approach. The data collection technique used is the Slovin Technique; the sample used is 36 respondents. The sampling technique used in this study uses non-probability with the number of populations in this study taken from customers who have shopped at Inomaret Wahidin. The scale used is the Likert scale, the data analysis technique uses correlation analysis, classical assumption test, determination correlation, multiple linear regression analysis and T test. Two asterisks mean a significant correlation at the level of 0.01 with a 2-sided test. Meanwhile, the closeness of the relationship is substantial because the value is more than 0.918. Which means that the variables X1, X2 and Y have a strong positive correlation. Then from the correlation test, the percentage determination between Service Quality, Product Quality and customer satisfaction was 84.8%, of which the remaining 15.2% was influenced by other factors outside of this study.
Keywords: Service quality; Product quality; Customer satisfaction.

1. Introduction

The retail business in Indonesia, especially in Medan, has experienced quite rapid development in recent years, with various forms and types. Retail is a business that sells household products, including daily necessities, using a self-service system (consumers take the goods they want themselves). Every day, competition in the business world is getting tighter with the advancement of technology and information so that consumers have complete information about the choice of products available in the market. Therefore, consumers are the main thing that must be considered in addition to the products we present. According to Annisa & Hasoloan (2021), to win increasingly competitive competition, business actors are required to be able to create a competitive advantage over their products and services in an effort to satisfy customers. This is very important because the marketing concept states that meeting consumer needs is an economic and social requirement for the survival of a company.

Indomaret itself is a retail company and company that strictly maintains and prioritizes service quality and product quality in order to achieve consumer satisfaction and increase profits for the company. Indomaret is a chain of minimarkets that provides basic and daily necessities with a sales area of less than 200 m². The first store under the name Indomart was opened in Ancol, North Jakarta, on June 20, 1988, managed by PT Indomarco Prismatama. In 1997, the company developed the first outlet franchise business in Indonesia, after having more than 230 outlets. The number of outlets until 2015 was 11,400 outlets with details of 60% of the outlets being owned by themselves and the rest franchises owned by the community. As of June 2022, the number of outlets is 20,000 outlets.The purpose of the research is to prove empirically whether Service Quality and Product Quality have a positive and significant effect on Customer satisfaction at Indomaret Wahidin?

Fig. 1. The first Indomaret in Indonesia.

As shown above, this is the first image of idomaret in Indonesia.

2. Methodology

According to Veronica et al., (2022), research methods are scientific ways to obtain evidence or information in order to achieve the desired goals and benefits. According to Balaka, (2020) research means searching again and continuing to search again. In a more specific sense, scientific research is a series of observations that are made continuously and continuously, accumulating and will eventually produce theories that can explain phenomena.

In this study, I used a quantitative method where to find out how many samples should be taken, I used the solving formula sample technique, and used a data collection technique using a questionnaire or closed questionnaire technique. In this study, I used 2 independent variables and 1 dependent variable where the variables that could not be maintained were Service Quality (X1), Product Quality (X2) and the bound or dependent variable was Customer Satisfaction (Y).

According to Janna (2020) Research Variables are attributes, values or properties of a research object (individual or activity) that have certain variations between one object and another. According to (Misbahuddin et al., 2021), the operational definition of a variable is to explain the research variable and the measurement scale of the variable and provide a limit to the variable being studied.

According to Amin et al., (2023), sampling techniques are indispensable in a study because they are used to determine who are the members of the population to be sampled. For this reason, sampling techniques must be clearly explained in the research plan so that they are clear and not confusing when entering the field.

According to Firmansyah & Dede (2022) sampling techniques are carried out to resemble the purpose of which is to eliminate confusion between techniques that look somewhat similar to each other. The technique used by the researcher is the sampling technique, which uses non-probability sampling which means giving equal opportunities to each member of the sampling.

According to Mardiatmoko (2020) the classical assumption test is an analysis carried out to assess whether there is a problem with the classical assumption in the OLS linear regression model. According to Jackie et al., (2022), simple linear regression is used for only one independent variable and one independent variable. According to Iskandar Yahya et al., (2023) simultaneous regression testing (f test) is useful for testing the influence of each independent variable simultaneously (together) on the dependent variable.

According to Basyit et al., (2020), the multicollinearity test was carried out with the aim of finding out if there is a correlation between independent variables in the regression model.

In data collection, I made direct observations on the level of proficiency of students through the learning platform. In this study, I used primary data, where I directly confronted the audience and got data directly from research sources directly.

In this study, I used Primary data, where I directly confronted the audience and got data directly from research sources directly. According to (Onesya Sarwana et al., 2023) the validity test determines the feasibility of the question list element (construction) when defining variables. The validity test aims to find out whether the questionnaire used by the researcher in measuring and obtaining research data from respondents is valid or not.

The tester uses the SPSS 25 program, and the tester also uses a validity test, where I use Product Moments, which is by linking the score of each item to the total score. The total score is the sum of the entire item. Items that are significantly correlated with the total score indicate that they are able to provide support in expressing what they want to express. According to Wijaksana, (2022) reliability tests are the level of consistency and stability of data or findings. The reliability that is considered quite high is > 0.6 with the Cronbach alpha formula as follows:

$$r =] [1- [ ][\frac{k}{(k-1)} \frac{\sum \sigma_b 2}{\sigma_r^2}$$

Information:
r = Reliability of the instrument coefficient (Cronbach alpha)
k = number of question items
∑ = total variants butir
s = variant total

Reliability test criteria
If the value of R ≥ 0.6 then the question item is reliable.
If R < 0.6, then the question item is unreliable.
Conclusion in the reliability test The author used Cronbach's harp formula.

2.3.3 Normality Test

According to (Wijaksana, 2022) the normality test aims to determine whether the regression model of dependent variables and independent variables has a contribution to the normality test of data using the author will use the Liliefors test by looking at the value on the Kolmogorov smirnow or not. The data is declared to be normally distributed if the significance is greater than 0.05.

According to Wijaksana, (2022) the formula used is:

$$p = \frac{t_t - \underline{t}}{s} \quad (1)$$

Information:
t_t : Sample value to t
$\underline{t}$: average score
s : Standard Division

The conclusion is that the Normality test examiner uses *the Smirnov-Kolmogorov formula.*

According to (Jusmawati et al., 2020), linearity is assessed to determine the linear relationship with the value of the sig value greater than α in the ANOVA table for Deviation from Linearity in SPSS software. The linearity test is a requirement in personal correlation analysis or linear regression.

The results of the linearity test/linearity test with the SPSS 25 program identified a significant level of 0.05. Two variables are said to have no linear relationship when the significant (Deviation FromLineierity) is less than 0.05.

i. If the value of Sig DeviationFrom Lineierity > 0.05, then there is a linear relationship between the independent variable and the bound variable
ii. If the value of Sig DeviationFrom Lineierity < 0.05 then there is no linear relationship between the independent variable and the bound variable

The conclusion is that the tester's Linearity test is pegged to DeviationFrom Linearity, because the Variable is more than 2. According to (Wijaksana [2], 2022) The T test aims to see the effect of Service Quality and product quality on consumer satisfaction. The proposed research hypothesis is approved if the calculation t-value is greater than the table t-value, and vice versa. The participation rate is (a)= 5%= 0.05. The criteria can be seen in the statement below: If the calculated t-value is smaller than the t-table, then Ha is rejected and H0 is accepted, meaning that this study is not affected. If the t-statistical value is greater than the t-table value (t-statistic > 1.96), then Ha is accepted and H0 is rejected, meaning that this study is negatively impacted.

3. Results and Discussion

The type of research used in this study is a type of quantitative descriptive research. This type of research aims to analyze and draw conclusions about the state of the object being researched based on the facts contained in the company. Based on the results of research that has been carried out on 36 respondents through the distribution of questionnaires to Indomaret Medan customers. The number of respondents used, namely 36 respondents with gender categories, can be seen in the following table:

Table 1. Definitions by number of Audiences

Criterion	Frequency	Present (%)
Woman	15	42%
Men - Men	21	58%
Entire	36	100%

In determining the validity test, the author uses SPSS 25 with the Bivariate Correlation formula. The value of the table with N = 200 and a significance level of 0.05 is 0.116. The questionnaire item was declared valid ifr_hitung> 0.116

Table 2. Validity Test Results

Variabel	Thing	rCalculation	rTable	Validity
Quality of Service (x1)	Benda	0,833	0,116	Saw
	Benda	0,970	0,116	Saw

	Benda	0,791	0,116	Saw
	Benda	0,699	0,116	Saw
	Benda	0,791	0,116	Saw
	Benda	0,791	0,116	Saw
	Benda	0,956	0,116	Saw
	Benda	0,812	0,116	Saw
	Benda	0,812	0,116	Saw
	Benda	0,950	0,116	Saw
	Benda	0,927	0,116	Saw
	Benda	0,947	0,116	Saw
	Benda	0,927	0,116	Saw
	Benda	0,912	0,116	Saw
	Benda	0,678	0,116	Saw
	Benda	0,889	0,116	Saw
	Benda	0,836	0,116	Saw

Based on the table above, all items are valid above >0.5, so the validity of this study is accepted.

The instrument is declared reliable if the value of the Alpha Cronbach coefficient > 0.6.

Table 3. Reliability test results

No	Variable	Criterion	Alfa Cronbach	Information
1	Product Quality	0,6	0,811	Reliable
2	Quality of Service	0,6	0,774	Reliable
3	Consumer Satisfaction	0,6	0,813	Reliable

Based on the results of the data above, all reliability results are >0.6 which indicates that all data results are accepted. This Normality Test uses Kolmogorov-Smirnov. The data is stated to be distributed normally if the p-value is significant > 0.05.

Table 4. Normality Test Results

Kolmogorov-Smirnov Test One Sample	
	Non-Standard Residue
N	36
Monte Carlo Sig. (2 oaks)	200

Based on the results of the Normality Test, it is known that the significant value is 0.200 > 0.05, so it can be concluded that the residual value is distributed normally. Based on the results of the Brand Image, Product Quality to Consumer Satisfaction test, linearity is known *to have a Deviation From Linearity* of Brand Image (X1) of 0.285 > 0.05 and Product Quality (X2) of 0.341 > 0.05, it can be concluded that the variables X1, X2 and Y have a linear relationship. According to Hardani, the Determination coefficient test is used to determine how much the presentation contributes to the dependent variable's influence. In this study, the author used the adjusted R-squared value.

Table 6. Determination Test Results

Summer models			
Pattern	R	Customized R Box	Std. estimation error
	.916a	.834	.72518

a. Predictor: (Constans) brand image

From the data above, the value of R is 0.834 which means that the relationship between the variables X1 and X2 and the variable Y is very strong. The Adjusted R squared value (determination coefficient) is 0.848 which means that the magnitude of the influence of variable X on Y is 84.8 and the remaining 15.2% is influenced by other variables outside of this study. The partial test (T test) aims to see the influence of brand image on consumer satisfaction. The proposed research hypothesis is approved if the calculated t-value is greater than the t-value of the table, and vice versa. The participation rate is (a)= 5%= 0.05.

Table 7. T-test results

Non-Standard Coefficients			Standard Coefficient		
Pattern	Number of Squares	Df	Square Average	t	Alone
Regression	92.675	1	92.675	176.226	000b
Return	70.880	34			
Entire	110.556	35	.526		

Based on the above data, it can be concluded that it is known that the value of the degree of freedom in the residual result is 42. Then T-table = (significance $\propto$) = 0.05, two tails. From the t-test result data, the calculation results of t service quality (X1) = 2,116 and Product Quality (X2) = 3,000 are greater than the table t, which is 2,018 (2,116 (X1) and 3,000 (X2) is greater than 2,018), then the hypothesis is accepted, which means that Service Quality and Product Quality affect Customer Satisfaction.

4. Conclusion

Indomaret is one of the largest retail franchises in Indonesia that has managed to achieve great success in the retail industry. With more than twenty years of experience, Indomaret has become one of the icons in the Indonesian business scene. Here is a conclusion that summarizes various aspects about Indomaret:

First of all, the success of Indomaret can be seen from their very extensive network of stores. With thousands of outlets spread across the archipelago, Indomaret has become one of the largest and most accessible retailers in Indonesia. Their widespread presence makes it easier for consumers to get various products and services easily. In addition, Indomaret is also known for providing a wide range of products at affordable prices. This makes Indomaret the main choice for many people, especially those who want to shop frugally. This friendly pricing policy has made Indomaret a popular choice among all walks of life.

Furthermore, friendly and efficient service is also one of Indomaret's advantages. Indomaret employees are trained to provide the best service to customers, making the shopping experience at Indomaret fun and comfortable. In addition, the existence of additional services such as bill payment and credit top-up also strengthens Indomaret's position as a complete shopping center. Indomaret has also shown their commitment to innovation and technology. Through programs such as mobile applications and customer loyalty programs, Indomaret continues to strive to improve the convenience and shopping experience for their customers. In addition, these measures also help Indomaret remain relevant in the face of growing online retail competition.

Abstract

Investment interest among university students is increasingly vital in cultivating a financially literate young generation. However, limited financial knowledge and increased risk perceptions often hinder this interest. This study aims to analyze the impact of financial literacy and risk perception on students' investment interest in Medan. Employing a quantitative approach with a survey method, data were collected through questionnaires distributed to 399 students from various universities in Medan. Multiple linear regression analysis revealed that both independent variables significantly influence investment interest (F-value = 544.069; Sig. = 0.000). Individually, financial literacy and risk perception positively and significantly affect investment interest, with an R^2 value of 0.733. This indicates that 73.3% of the variation in investment interest can be explained by these two variables. The findings suggest that enhancing financial literacy and effectively managing risk perceptions can encourage students to invest more actively. These insights are crucial for educational institutions and stakeholders in developing more effective financial education programs.
Keywords: Financial Literacy; Risk Perception; Investment Interest.

1. Introduction

Investment interest is a person's tendency or desire to carry out investment activities either in the form of real assets or financial assets, with the hope of making a profit in the future. This interest is not only formed instantly, but through a series of complex rational and emotional consideration processes. A person will consider the extent of their understanding of investment instruments, capital readiness, confidence in the returns obtained, and the potential risks that may be faced. In the context of the younger generation, especially students, investment interest can be the first step in forming financial independence and a visionary mindset towards personal financial management (Yusup, 2024). However, in reality, there are still many students who show a passive attitude towards investment and prefer to save money in the form of conventional savings or allocate it for short-term consumption.

One important aspect that greatly influences investment interest is financial literacy. Financial literacy is an individual's ability to understand and apply basic concepts in personal financial management, including financial planning, budgeting, saving, credit utilization, and making smart investment decisions (Kusumawati et al., 2023). This literacy allows individuals to make appropriate and rational financial decisions according to their conditions and life goals. A student who has a high level of financial literacy will more easily recognize the importance of long-term financial planning, realize the benefits of investment, and have the ability to manage risk wisely. Conversely, students with low financial literacy tend to ignore the importance of investment and focus more on meeting momentary consumptive needs, even potentially experiencing financial difficulties in the future.

Every student is expected to have financial knowledge, including individual *understanding* of basic principles of finance including interest, risk, inflation, diversification, and financial instruments such as savings, credit, and investment. According to Lusardi & Mitchell, this basic

knowledge is important so that individuals are able to recognize the financial options available and avoid financial traps (El Ikhwan & SE, 2023). In addition, self-confidence in financial decision making also plays an important role. Individuals with good financial literacy knowledge are expected to have self-confidence when they start investing. The indicators include a sense of confidence in choosing an investment instrument after obtaining sufficient information, not being easily influenced by external opinions, and readiness to face investment risks. In addition, self-confidence is also seen as the motivation to continue learning and improving financial understanding in order to get better financial targets in the future (Loprang et al., 2022).

Financial literacy is becoming increasingly relevant amidst the rapid development of financial technology (fintech), where various financial products and services are easily accessible to the wider community, including students. Digital investment applications such as Bibit, Ajaib, and Bareksa allow anyone to start investing with only a small capital and through a simple process. However, this convenience does not necessarily increase students' interest in investing if it is not accompanied by an adequate understanding of the functions, benefits, and risks of these financial products. Many students are hesitant or even afraid to invest because they think that investment is only suitable for people who already have a steady income or because they are afraid of losing money due to market fluctuations. This doubt is closely related to risk perception, namely a person's perspective or assessment of the potential for loss or danger in making investment decisions. Risk perception is not something that is objective, but subjective and is greatly influenced by experience, education, information received, and the individual's psychological condition (Pracoyo et al., 2025). Students who have a high-risk perception will tend to avoid investing, even though it actually has the potential for high returns. They prefer safe zones, such as saving in banks or keeping money in cash, because they feel that investment is too risky and dangerous. In fact, investment risk can be managed through asset diversification, selecting instruments that match the risk profile, and understanding market conditions. In other words, an inaccurate risk perception will be the main barrier for students to start investing.

Medan City, as a large city and hub of higher education in North Sumatra, has a relatively large student population and holds great potential to become an active young investor segment. This city has many colleges and universities that graduate thousands of students from various majors every year. Students as an intellectual group are expected to be aware of the importance of financial literacy and good financial management. However, based on initial observations conducted by researchers through informal interviews and limited distribution of questionnaires, it was found that the level of student participation in investment activities in Medan City is still relatively low. Most of the students interviewed admitted that they had never made any investment, be it mutual funds, stocks, or digital gold. The most dominant reasons were a lack of understanding of how investment works and concerns about the risk of loss. This finding strengthens the suspicion of Devi Rifani, Andri Soemitra, and Nurlaila Nurlaila that the financial literacy of UIN North Sumatra students has not been fully formed comprehensively (Rifani et al., 2025). Even when students are familiar with digital investment platforms, they are still reluctant to begin investing due to a perceived lack of sufficient information or a fear of market uncertainty. High risk perception, although often not based on personal experience, is a significant inhibiting factor. In some cases, students also associate investment with dangerous speculative practices, even though with the right knowledge and strategy, investment risks can be minimized. Students must also understand and have trust in information sources (Trust in Information Source), assessing the extent to which individuals trust the information they obtain regarding a risk. If someone does not trust the source of information (eg media or financial institutions), then they will perceive the risk as greater because they feel the information received is inaccurate or incomplete (Yunita et al., 2023).

The lack of students' interest in investing shows the imbalance between opportunities and reality. On one hand, they have wide access to information and financial technology, but on the other hand, they do not utilize it optimally. In fact, forming investment habits from an early age will greatly help students in building financial stability in the future, including as initial capital to start a business, buy assets, or prepare for early retirement. If understanding financial literacy can be improved and perception of risk can be managed well, then the opportunity for students to become active investors will be even greater. The level of financial literacy is also an important factor in shaping risk perception. Individuals who have basic knowledge of the concepts of risk, diversification, returns, and market fluctuations will be better able to assess risk objectively and not easily panic about changes in financial situations (Gevionita et al., 2025). Also, increased self-confidence after understanding investment risks illustrates that risk perception can decrease if individuals already understand the characteristics and how to mitigate risk (Rizal et al., 2024).

Based on the description that has been explained, the researcher feels the need to conduct a scientific study that aims to examine in more depth the Influence of Financial Literacy and Risk Perception on Investment Interest in Students in Medan City. This study is expected to provide a comprehensive understanding of how these two factors shape students' attitudes towards investment. In addition, the results of this study can also be used as evaluation material and input for campuses, financial institutions, and the government in designing programs to improve financial literacy and investment education that are more effective for the younger generation.

2. Methodology

Participants

In this study, the population consisted of all undergraduate (S1) students in Medan City, estimated at approximately 175,000 people based on data from various state and private universities. Assuming that they have acquired more relevant academic experience and knowledge on investment topics compared to first semester students.

To determine the number of samples, the researcher used the Slovin formula with a margin of error of 5% (0.05) as follows:

$$n=N / (1+N(e2)) \quad (1)$$

It is known:
- n = Sample
- N = Population
- e = error tolerance 0.05 (5%)

So, the sample size (n) if adjusted n:
n=N / (1+N(e2))
n=175,000 / (1+175,000(0.052))
n=175,000 / (1+(175,000 x 0.0025))
n=175,000 / (1+437.5)
n=175,000 / (438.5)
n=399,087

Therefore, the sample used in this study consisted of 399 students in semester 2 and above, recruited from various universities in Medan City.

In the study, the initial steps included data acquisition, preparation of instruments, preparation of statements for each variable, questionnaires designed in *google form format,* distributed via social media (WhatsApp), collection of information and data from respondents, analyzing information and data from respondents, and preparation of reports. Data collection was carried out during the period of February to March 2025. In distributing this questionnaire, the sampling method was carried out on respondents who met the research criteria, the respondents were then asked to recommend other people who also met the criteria and so on (Snowball Effect). Prior to filling out the questionnaire, respondents were given an explanation regarding this study. Operational variables are the description of research variables into a form that can be measured empirically, so that it can be used as a basis for compiling research instruments and collecting data (Suriani & Jailani, 2023). The following are details of each research variable:

a. Financial Literacy

Aims to determine the scale of knowledge, understanding, and personal ability in managing personal finances effectively, including knowledge of investment products and risks. Measured by the following 10 statements:

1) I can manage my personal budget effectively, including saving and investing
2) I feel I have a pretty good understanding of the basic concepts of investing
3) I know how to choose investment products that suit my financial goals
4) I often look for information related to the stock market and other investment instruments
5) I feel I have a pretty good understanding of the risks associated with investing
6) I understand how to calculate the potential profit and risk of an investment instrument
7) I can differentiate between short term and long-term investments
8) I know various types of investment instruments, such as stocks, bonds, and mutual funds
9) I understand how the stock market works and how stock prices can change
10) I feel confident enough in making investment decisions after studying appropriate financial literacy

b. Risk Perception

Aims to find out a person's response to the possibility and impact of a decline that can occur from a decision when investing. Measured by the following 10 statements:

1) I feel that investing always has a high risk
2) I am afraid of losing money when investing without sufficient knowledge
3) Investment risks can be minimized if I understand the instrument I choose well
4) The higher the potential profit, the higher the risk I have to bear
5) I tend to avoid investments that have high risks
6) I believe that every investment decision carry risk that must be faced
7) I tend to avoid investments that have unclear risks, even if they have the potential for large profits
8) I feel uncomfortable with investments that have high price
9) I feel that investing without sufficient knowledge is a very risky decision
10) I feel more confident investing after understanding the risks that may occur

c. Investment Interest

Aims to find out the desire, interest, and readiness of individuals to make real investments in the present or future. Measured by the following 10 statements:

1) I believe that investment can provide great benefits for my finances in the future

2) I am interested in starting to invest in financial instruments
3) I plan to start investing in the near future once I feel more financially prepared
4) I believe that investing can help me achieve my financial goals in the future
5) I feel the need to start investing right now, even though I am still learning about it
6) I would consider investing if I had more information and understanding about it
7) I am interested in investing even though I don't have enough experience in this field
8) I plan to start investing after completing my studies
9) I want to start investing to prepare for the future financially
10) I feel that investing now can help with both short-term and long-term financial plans

Statistical Analysis

The analysis technique in this study is quantitative descriptive analysis, which aims to discuss the point of collection, processing, and presentation of data groups based on the results of the questionnaire that has been distributed to participants. The selection of this technique is important because the analysis can explain the performance of each research variable, as well as facilitate understanding of the data that has been collected. This study will be presented in the form of a frequency table that will describe the distribution of the data obtained.

Here are the steps:

a. Descriptive analysis, analysis that focuses on describing the attributes or characteristics of participants/respondents, including gender, age, semester, study program, and others. The goal is to understand the background of the subjects who are the samples in the study.
b. Validity and Reliability Test, Validity test is conducted to determine to which extent the items in the questionnaire are able to represent the measured variables. After all items are declared valid, it is continued with a reliability test to ensure that the instrument can provide consistent results when reused under similar conditions. Reliability testing uses the Cronbach's Alpha method, where the instrument is considered reliable if the alpha value is greater than 0.60.
c. Multiple linear regression analysis, at this stage a series of classical assumption tests are carried out to ensure that the regression model used meets the basic requirements, so that the analysis results are valid and reliable. The classical assumption tests used in this study include normality, multicollinearity, and heteroscedasticity tests. In addition, hypothesis testing is also carried out consisting of three types, namely the coefficient of determination test (R^2), partial test (t test), and simultaneous test (F test) to obtain more accurate analysis results.

3. Results and Discussion

This study involved a total of 399 respondents who were students from various universities in Medan City. All respondents were active students. Bachelor Degree (S1) from semester 2 and above, as determined in the population and sample criteria. The data obtained from the questionnaire were filled in completely without any deficiencies (missing data = 0), so that all respondents could be included in the analysis process. Thus, the value of N = 399 was used consistently for each variable in this study. For a clearer picture, this descriptive analysis is in the form of respondent characteristics that have been presented based on several parts:

1) Gender

Table 1. Results of Statistical Analysis of Gender Characteristics

Gender	Frequency	Percentage (%)
Man	196	49.1%
Woman	203	50.9%
Total	399	100.0%

From the data, it can be seen that the number of female respondents is greater than male, which is 50.9% compared to 49.1%. This means that students in this study tend to be balanced in terms of gender, thus allowing for a more objective analysis without the dominance of one group.

2) Age Group

Table 2. Results of Statistical Analysis of Age Group Characteristics

Age	Frequency	Percentage (%)
18 – 21 Years	114	28.6%
22 – 25 Years	272	68.2%
26 – 29 Years	13	3.3%
Total	399	100.0%

Most participants were in the age range of 22 to 25 years (68.2%), which generally corresponds to active students in their middle to final semesters. Meanwhile, the age group of 18–21 years comprised 28.6% of respondents, likely consisting of students in semesters 2 to 4. Meanwhile, the 26–29 years age group was the smallest group (3.3%), which probably represented students who extended their studies or completing their final assignments. This age distribution explains that most respondents are in the early adulthood phase, where awareness of personal financial management, including interest in investment, begins to form and develop significantly.

3) Colleges

This diversity of college origins aims to obtain a broader and more comprehensive representation of student investment interests across institutions. Here is the complete distribution based on college origin:

Table 3. Results of Statistical Analysis of Characteristics of Origin of Higher Education Institutions

No	College Name	Number of Respondents	Percentage (%)
1	Islamic University of North Sumatra (UISU)	65	16.3%
2	Muhammadiyah University of North Sumatra (UMSU)	56	14.0%
3	State University of Medan (UNIMED)	49	12.3%
4	University of North Sumatra (USU)	59	14.8%
5	State Polytechnic of Medan (POLMED)	24	6.0%
6	Sukma College of Management Sciences (STIM Sukma)	14	3.5%
7	Triguna Dharma University	22	5.5%
8	Panca Budi Development University (UNPAB)	16	4.0%
9	Indonesian University of Excellence (UNPRI)	5	1.3%
10	Al Washliyah University (UNIVA)	10	2.5%
	Total	399	100.0%

Participants from UISU are at (16.3%), followed by USU (14.8%) and UMSU (14.0%). Meanwhile, the universities with the fewest respondents were UNPRI (1.3%) and UNIVA

(2.5%). This variation shows that the study covers various educational institutions, both public and private, with the hope of producing more comprehensive and generalizable findings.

4) Respondent Faculty/Department

This diversity of academic backgrounds provides a broader view of students' interests and perceptions of investment. Overall, there are 399 students from more than 40 different study programs or departments.

Table 4. Results of Statistical Analysis of Faculty/Department Characteristics

No	Faculty/Department	Frequency	Percentage (%)
1	Management	55	13.80%
2	Agriculture	50	12.50%
3	Pharmacy	34	8.50%
4	Medical	31	7.80%
5	Technique	29	7.30%
6	PAI (Islamic Religious Education)	24	6.00%
7	Civil Engineering	13	3.30%
8	Islamic education	12	3.00%
9	Islamic Economics	11	2.80%
10	Computer Science	11	2.80%
11	Electrical Engineering	11	2.80%
12	Arabic literature	9	2.30%
13	Mechanical Engineering	8	2.00%
14	Economic Education	7	1.80%
15	Law	6	1.50%
16	Islamic Banking	5	1.30%
17	Business Administration	5	1.30%
18	Agrotechnology	4	1.00%
19	Accountancy	4	1.00%
20	Islamic Counseling Guidance	4	1.00%
21	Electrical Engineering Education	4	1.00%
22	Biology	16	4.00%
23	Economy	18	4.50%
24	Financial management	2	0.50%
25	Industrial Chemistry	2	0.50%
26	Public health	2	0.50%
27	Computer Engineering	2	0.50%
28	Business Management	3	0.80%
29	FKM	3	0.80%
30	Others (≤ 0.30% per major)	34	8.50%
	Total	399	100.0%

The majority of participants came from the Management (13.80%), Agriculture (12.50%), and Pharmacy (8.50%). This diversity of backgrounds is important because it can provide different insights in assessing students' understanding and interest in investment topics, depending on the field of study they are studying.

5) Semester Level

The semester levels included in this study ranged from semester 2 to semester 8, with the consideration that students in semester 2 and above are assumed to have sufficient academic experience and a more relevant understanding of investment material compared to first semester students.

Table 5. Results of Statistical Analysis of Respondents' Semesters

Semester	Frequency	Valid Percentage (%)
2	82	20.6%
3	1	0.3%
4	134	33.6%
5	3	0.8%
6	126	31.6%
7	2	0.5%
8	51	12.8%
Total	399	100.0%

The data show that the majority of respondents were from semester 4 (33.6%) and semester 6 (31.6%). This reflects that most respondents have been in the middle to final stages of their studies, so they are considered to have more mature views and readiness in providing responses to the topics studied.

6) Investment Interest

Table 6. Results of Statistical Analysis of Investment Interest

Category	Frequency	Percentage (%)
Not invested yet, but interested	277	69.4%
Not invested yet, but not interested	50	12.5%
Already invested	72	18.0%
Total	399	100.0%

The data indicates that most respondents, 69.4%, have not invested but are interested in investing in the future. Meanwhile, 18.0% of respondents have invested or are investing, and only 12.5% are not interested in investing. This finding reflects the great potential in developing investment literacy and education among students, especially to encourage groups who are interested but have not started investing to take concrete steps in managing their finances more productively.

a. Validity and Reliability Test

Validity testing is done by comparing the calculated r value to the table r. In this study, the number of respondents was 399 people, so the table r value at a significance level of 5% (α = 0.05) is 0.098. If the calculated r value is greater than the table r, then the statement item is considered valid. Conversely, if the calculated r value is smaller than the table r, then the item is considered invalid and is not used in further analysis. The results of the validity test for the Investment Interest variable are presented as follows:

Table 7. Validity Test Results

Item	Variables	Question Code	r count		r table (5%)	Information
1		X1.1	0.655	>	0.098	Valid
2		X1.2	0.703	>	0.098	Valid
3		X1.3	0.628	>	0.098	Valid
4		X1.4	0.616	>	0.098	Valid
5	Financial	X1.5	0.592	>	0.098	Valid
6	Literacy (X1)	X1.6	0.578	>	0.098	Valid
7		X1.7	0.629	>	0.098	Valid
8		X1.8	0.605	>	0.098	Valid
9		X1.9	0.623	>	0.098	Valid
10		X1.10	0.643	>	0.098	Valid
11		X2.1	0.531	>	0.098	Valid

12	Risk Perception (X2)	X2.2	0.621	>	0.098	Valid
13		X2.3	0.588	>	0.098	Valid
14		X2.4	0.621	>	0.098	Valid
15		X2.5	0.574	>	0.098	Valid
16		X2.6	0.638	>	0.098	Valid
17		X2.7	0.627	>	0.098	Valid
18		X2.8	0.593	>	0.098	Valid
19		X2.9	0.662	>	0.098	Valid
20		X2.10	0.633	>	0.098	Valid
21	Investment Interest (Y)	Y1	0.669	>	0.098	Valid
22		Y2	0.633	>	0.098	Valid
23		Y3	0.651	>	0.098	Valid
24		Y4	0.641	>	0.098	Valid
25		Y5	0.647	>	0.098	Valid
26		Y6	0.646	>	0.098	Valid
27		Y7	0.602	>	0.098	Valid
28		Y8	0.572	>	0.098	Valid
29		Y9	0.646	>	0.098	Valid
30		Y10	0.670	>	0.098	Valid

Based on the results of validity testing of all items in the variables of Financial Literacy (X1), Risk Perception (X2), and Investment Interest (Y), it was obtained that all items had a calculated r value that exceeded the r table of 0.098. This indicates that all statements in the questionnaire are valid and suitable for use as measuring instruments in this study. After its validity being confirmed, the next stage is to test the reliability to assess the extent to which the instrument is consistent and reliable in measuring each variable. Reliability testing uses the Cronbach's Alpha method, with the provision that a variable is said to be reliable if the alpha value is more than 0.60.

Table 8. Reliability Test Results

Variables	Item	Cronbach's Alpha	Information
Financial Literacy (X1)	10	0.829	Reliable
Risk Perception (X2)	10	0.811	Reliable
Investment Interest (Y)	10	0.838	Reliable

The results of the reliability test for the three variables as presented in the table above, are as follows:

a) Financial Literacy Variable (X1), consists of 10 statement items; this variable obtained a Cronbach's Alpha value of 0.829. This value is above 0.80, which indicates that the items in this variable are very reliable and have high consistency in measuring the level of financial literacy of respondents.
b) Risk Perception Variable (X2), with a total of 10 statements, the Cronbach's Alpha value obtained is 0.811. This value indicates that the instrument has very good reliability and is effective in describing individual perceptions of risk in investing.
c) Investment Interest Variable (Y) This variable also consists of 10 items, and the results of the reliability test show a Cronbach's Alpha value of 0.838. This figure reflects that the measuring instrument for assessing respondents' investment interest is classified as very reliable and can produce stable and consistent data.

Overall, all research instruments on variables X1, X2, and Y have Cronbach's Alpha values above the minimum threshold of 0.60. This indicates that all statement items in the questionnaire can be classified as reliable. This means that the measuring instrument used in

this study is able to produce reliable and consistent data. With these results, the instrument has met the validity and reliability criteria and is ready to be used in the next analysis stage, such as classical assumption tests and multiple linear regression.

b. Multiple Linear Regression Analysis

1) Classical Assumption Test

Normality Test

Normality testing aims to ensure whether the data in this study follows a normal distribution. This process is very important because it is one of the prerequisites in the application of multiple linear regression analysis. This is because one of the basic assumptions of regression is that the residuals of the data must have a normal distribution.

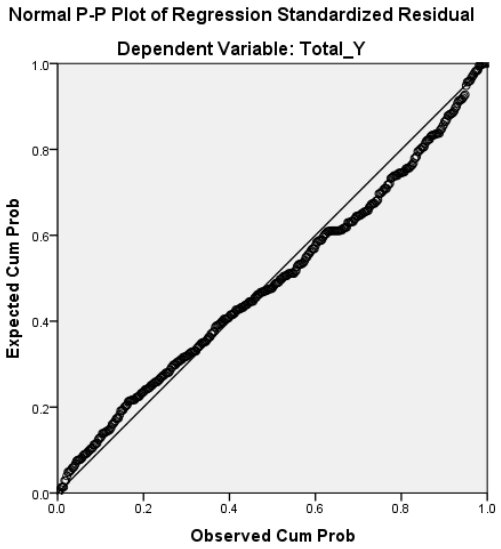

Fig. 1. PP plot graph

The PP Plot image shows that most of the residual points mapped mostly follow a pattern that is very close to the diagonal line (the ideal normal line). The symmetrical distribution of points close to the diagonal line reflects that the difference between the actual residual value and the expected residual value based on the normal distribution is relatively small. In other words, there is no systematic deviation pattern or extreme outliers that could indicate a violation of the normality assumption.

Table 9. Results of Test of Normality

	Kolmogorov-Smirnov [a]			Shapiro Wilk		
	Statistics	Df	Sig.	Statistics	Df	Sig.
MI_T	.096	399	.068	.965	399	.073

Normality testing using the Kolmogorov-Smirnov and Shapiro-Wilk methods shows that the data in this study follows a normal distribution. In the Kolmogorov-Smirnov test, a significance value of 0.068 was obtained, which exceeds the threshold of 0.05. This indicates that the data does not show deviations from the normal distribution. Likewise, the results of the Shapiro-Wilk test produce a significant value of 0.073, also greater than 0.05, which confirms that the data are normally distributed. Thus, both tests indicate that the data is considered to meet the normality assumption.

Multicollinearity test is conducted to determine whether there is a strong linear correlation between independent variables in the regression model. The presence of multicollinearity can result in inconsistent regression coefficient estimation results and make it difficult to interpret the analysis results correctly.

Table 10. Multicollinearity Test Results Coefficients [a]

Model		Unstandardized Coefficients		Standardized Coefficients	T	Sig.	Collinearity Statistics	
		B	Std. Error	Beta			Tolerance	VIF
1	(Constant)	3.855	.934		4.127	.000		
	Financial Literacy	.381	.048	.384	7,867	.000	.280	3,577
	Risk Perception	.527	.051	.508	10,408	.000	.280	3,577

Based on the output results from SPSS, it was found that the Tolerance value for the Financial Literacy and Risk Perception variables was 0.280 for each, while the VIF (Variance Inflation Factor) value for both was 3.577. Because the tolerance value is greater than 0.10 and the VIF is below 10, it can be concluded that there is no multicollinearity symptom between the independent variables in this regression model. Therefore, the regression model used meets the requirements of being free from multicollinearity and can be continued to the multiple linear regression analysis stage without being influenced by high correlation between the independent variables.

The heteroscedasticity test aims to identify whether there is a difference in residual variance in the regression model. One way to detect it is by observing the distribution pattern of points in the scatterplot graph between the Unstandardized Predicted Value and Unstandardized Residual values. This distribution pattern is used to assess whether or not there are symptoms of heteroscedasticity in the model.

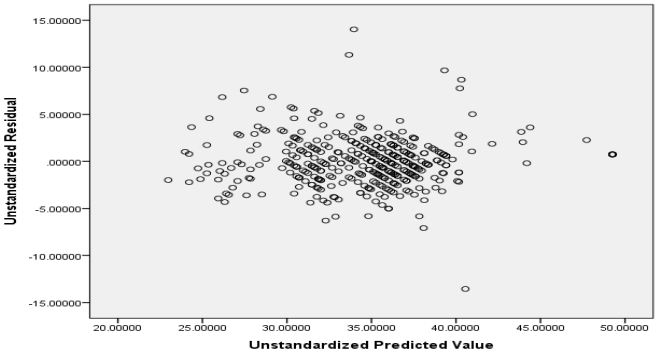

Fig. 2. Results of Heteroscedasticity Test

Based on the test results, it can be seen that the residual points are randomly distributed without forming a particular pattern. This random distribution indicates that the residual variance is constant or called homoscedastic, which means there is no indication of violation of the heteroscedasticity assumption in the regression model.

2) Hypothesis Testing

Coefficient of Determination (R^2)

The determination coefficient (R Square) functions to determine the proportion of the variation of the dependent variable that can be explained by the independent variable in a regression model. In the context of this study, Investment Interest (Y) is the dependent variable, while Financial Literacy (X^1) and Risk Perception (X^2) act as independent variables.

Table 11. R-Squared Test Results Model Summary

Model	R	R Square	Adjusted R Square	Std. Error of the Estimate
1	.856 [a]	.733	.732	.22577

Based on the results shown in the Model Summary table, it is known that the R Square value is 0.733, indicating that around 73.3% of the variation in Investment Interest can be explained jointly by Financial Literacy and Risk Perception. The remaining 26.7%, is influenced by other factors not included in this model, such as social factors, individual motivation, economic conditions, or other external factors.

In addition, the Adjusted R Square of 0.732 indicates that the R Square value has been adjusted to the number of independent variables used, so that it still reflects the strength of the model accurately. The Standard Error of the Estimate value of 0.22577 indicates the average level of model prediction error against actual data, and this value is relatively small, thus strengthening that the regression model built is quite precise and reliable.

F Test (Simultaneous)

The F test is used to assess whether the independent variables together have a significant influence on the dependent variable. In this study, the independent variables analyzed include Financial Literacy (X^1) and Risk Perception (X^2), while Investment Interest (Y) acts as the dependent variable .

Table 12. F Test Results ANOVA [a]

Model		Sum of Squares	Df	Mean Square	F	Sig.
1	Regression	55,467	2	27,733	544,069	.000 [b]
	Residual	20,186	396	.051		
	Total	75,653	398			

Based on the results of the ANOVA test shown in the table, it is known that the calculated F value is 544.069 with a significance level of 0.000. To determine the significance of the regression model, the calculated F value is compared with the F table value at a significance level of 5% ($\alpha = 0.05$), with degrees of freedom df1 = 2 (number of independent variables) and df2 = 396 (n – k – 1 = 399 – 2 – 1). Based on the F distribution table, the F table value is 3.02. Since the calculated F value (544.069) is much larger than the F table (3.02) and the significance value is less than 0.05, then H_0 is rejected and H_1 is accepted. This indicates that Financial Literacy and Risk Perception simultaneously have a significant influence on Investment Interest.

T-Test (Partial)

The T-test is used to measure the influence of each independent variable on the dependent variable, partially. In this study, the independent variables tested include Financial Literacy (X^1) and Risk Perception (X^2), while the dependent variable is Investment Interest (Y).

Table 13. T-Test Results Coefficients [a]

Model		Unstandardized Coefficients		Standardized Coefficients	t	Sig.	Collinearity Statistics	
		B	Std. Error	Beta			Tolerance	VIF
1	(Constant)	3.264	.080		40,922	.000		
	Financial Literacy	.033	.004	.396	8,054	.000	.279	3,579
	Risk Perception	.044	.004	.495	10,072	.000	.279	3,579

a. Dependent Variable: Investment Interest

Source: SPSS Version 22 output 2025

- Financial Literacy (X^1), based on the results of the t-test, it was obtained that the calculated t value was 8.054 with a significance level of 0.000. Since the calculated t value is greater than the t table (8.054> 1.966) and the significance value is less than 0.05 (0.000 <0.05), it can be concluded that the Financial Literacy variable has a partial and significant influence on Investment Interest. This indicates that the higher a person's knowledge of finance, the greater their interest in investing. This finding supports the view that understanding financial concepts and various investment instruments provides encouragement for individuals to make investment decisions with more confidence.
- Risk Perception (X^2), the test results show that the t-value is 10.072 with a significance value of 0.000. Since the t-value exceeds the t-table (10.072> 1.966) and the significance value is below 0.05 (0.000 <0.05), it can be concluded that Risk Perception also has a significant partial effect on Investment Interest. This indicates that the more positive an individual's view of investment risk (the less fear or worry about risk), the higher the tendency to invest.

.

Thus, both variables, namely Financial Literacy and Risk Perception, are proven to have a partial significant influence on Investment Interest. These results support the hypothesis proposed in the study and indicate that increasing financial understanding and managing risk perceptions are important factors in increasing people's interest in investing.

Multiple Linear Regression Analysis Results

Based on the results of multiple linear regression analysis, the following regression equation was obtained:

$$Y=3.264+0.033X1+0.044\ X2 \quad (1)$$

Information:
Y : Investment Interest
X^1 : Financial Literacy
X^2 : Risk Perception

The regression equation describes the relationship between the independent variables (Financial Literacy and Risk Perception) and the dependent variable (Investment Interest). Further explanation is as follows:

- The constant value (α) of 3.264 indicates that if Financial Literacy (X^1) and Risk Perception (X^2) are considered to have no influence or have a value of zero, then Investment Interest (Y) remains at the level of 3.264 units. This illustrates the basic level of investment interest held by respondents without being influenced by the two independent variables.
- The regression coefficient of Financial Literacy (X^1) of 0.033 indicates that every one unit increase in the Financial Literacy variable, assuming Risk Perception remains constant, will cause an increase in Investment Interest of 0.033 units. This shows that the better a person's understanding of finance, the higher their desire to invest.
- The regression coefficient of Risk Perception (X^2) of 0.044 indicates that a one-unit increase in the Risk Perception variable, assuming Financial Literacy does not change, will drive an increase in Investment Interest by 0.044 units. This indicates that the more optimistic a person is in viewing investment risk (the less afraid they are of risk), the more their interest in investing tends to increase.

Overall, both Financial Literacy and Risk Perception have a positive influence on Investment Interest. When compared, Risk Perception shows a greater contribution in increasing interest, as reflected by the higher regression coefficient value.

Based on the results of the t-test, the Financial Literacy variable is proven to have a positive and significant effect on the Investment Interest of students in Medan City, with a t-value of 8.054 and a significance value of 0.000 (<0.05). This indicates that the higher a student's level of financial literacy, the greater their interest in investing. This shows that a good understanding of basic financial concepts, investment products, risks, and investment benefits can encourage students to be more confident in making investment decisions. This finding is in line with the results of research conducted by Yuniasari et al. which concluded that financial literacy has a positive effect on investment interest, although other variables such as financial behavior and lifestyle do not have a significant effect. This study confirms the importance of the role of financial knowledge in shaping students' interest in investment activities (Yuniasari et al., 2024) .

Another study by Parulian and Aminnudin also supports this finding, showing that financial literacy and minimum investment capital have a positive effect on investment interest. This suggests that the more someone understands that investment can begin with affordable capital and offers long term profit potential, the greater their interest in starting to invest early. However, the results of this study differ from several previous studies (Parulian & Aminnudin, 2021). For example, Widhiastuti and Novianda stated that financial literacy has no effect on Generation Z's investment interest, and motivation is the most dominant factor. This implies that even if individuals possess financial knowledge, it may not be sufficient to encourage them to invest if they are not driven by strong motivation (Widhiastuti & Novianda, 2024).

Thus, although there are differences in the results of several previous studies, the findings in this study strengthen the view that in Medan City, financial literacy has a significant influence on students' investment interest. Differences in research results may be due to variations in respondent characteristics, geographic location, approaches analysis, and other variables that are taken into consideration. Therefore, efforts to improve financial literacy among students remain a strategic step to encourage investment growth from a young age.

The results of this study indicate that the Risk Perception variable has a positive and significant effect on the Investment Interest of students in Medan City. This is evidenced by the t-value of 10.072 and a significance of 0.000 (<0.05), which indicates that H_0 is rejected and H_1 is accepted. Thus, it can be concluded that the better the students' perception of investment risk, the higher their interest in investing. These results indicate that students no longer see risk as the main obstacle to investing, but rather as something that can be managed or even considered as part of a smart investment strategy. With an adequate understanding of risk,

students tend to feel more prepared to face market uncertainty and are more courageous to start investing.

In line with Dewi's research, which found that Risk Perception has a positive and significant effect on investment interest in the capital market among students at the Bali State Polytechnic (Dewi, 2022). The study explains that understanding and awareness of risk actually encourages students to be more careful and strategic, thus increasing their interest in investing wisely. Research by Putra Prayoga and Purnamawati also showed similar results, where risk perception has a positive effect on investment interest in the capital market, along with other variables such as investment education and returns. This strengthens the argument that risk perception is not merely a barrier, but can be a factor that drives investment interest if supported by a positive understanding and attitude towards investment (Putra Prayoga & Purnamawati, 2024).

However, the results of this study differ from those found by Sukma, who concluded that risk perception does not have much influence on investment decisions in sharia stocks, because risk is not the main consideration in making investment decisions, especially in the context of sharia finance (Sukma, 2021). Meanwhile, research by Johan and Azariani and Santoso and Dewi found that risk perception actually has a negative effect on investment interest. In Johan and Azariani's research, the context taken was gold investment, where high risk perception actually reduced Gen Z's interest in investing. These results illustrate that negative perceptions of risk can hinder investment participation, especially when not accompanied by good understanding (Johan & Azariani, 2025).

The difference in findings may occur due to variations in the types of investments used as research objects (stocks, gold, capital markets, sharia), respondent characteristics (location, age, education), and level of education and investment experience. In the context of Medan City students, these results indicate that understanding and readiness in facing investment risks have been formed quite well, so that risk perception is no longer an obstacle, but rather a factor that encourages them to invest wisely. The results of this study emphasize the importance of risk education in encouraging investment interest, and show that students who have good risk awareness tend to be more interested and readier to invest.

Based on the results of multiple linear regression testing shown through the ANOVA test (F-test), the calculated F value was obtained at 544.069 with a significance value of 0.000 (<0.05). These results indicate that the variables of Financial Literacy and Risk Perception simultaneously have a significant effect on the Investment Interest of students in Medan City. Thus, the hypothesis that financial literacy and risk perception jointly influence investment interest can be accepted. This finding indicates that both level of financial knowledge of students and their perception of risk have a strong contribution in shaping their interest in investing. Good financial literacy allows students to understand various investment products and strategies rationally, while perception of risk forms a cautious attitude and readiness in facing potential losses.

These results are in line with research by Angelika and Alinto (2024) which shows that financial literacy and risk perception have a significant positive effect on Generation Z investment decisions. The study stated that the higher a person's level of financial literacy, the more likely they are to make more informed investment decisions. Likewise, risk perception can strengthen decision-making by considering potential losses rationally. In addition, this finding is supported by Primasari et al (2024) which states that financial literacy, risk perception, financial behavior, and income simultaneously influence investment decisions. In this context, risk perception is believed to increase individual confidence in making investment decisions, although individual financial literacy does not always have a direct effect. However, in a simultaneous context, these two variables play a synergistic role in encouraging individuals to have an interest in investment. Jannah's research (2022) also supports these results, where

based on the ANOVA test, a significance of 0.003 was obtained, indicating that financial literacy and risk perception together influence investment interest. This study strengthens the evidence that the two variables cannot be separated in explaining the dependent variable of investment interest. However, not all studies find consistent results. For example, Putri (2025) found that financial literacy, financial behavior, and risk perception did not simultaneously influence investment decisions. This discrepancy in results is most likely due to differences in respondent characteristics, economic environment, and understanding of risk in each region or educational institution studied. Considering the results of this study and comparison with previous literature, it can be concluded that simultaneously, financial literacy and risk perception have a strong and significant influence in shaping students' investment interests in Medan City. This is an important basis for educational institutions and financial authorities to further intensify financial education and risk management programs for students in order to foster active participation in the world of investment from a young age.

4. Conclusion

Financial literacy has a significant and positive influence on students' investment interest. This suggests that the higher the level of financial understanding that students have, the higher their tendency to invest. This can be seen from the regression coefficient value of 0.033 and the t-test result of 8.054 which is significant at the 5% level. In other words, adequate financial knowledge encourages students to be more confident and interested in making investment decisions. Risk perception also shows a positive and significant influence on investment interest. The regression coefficient value obtained is 0.044, and the t-test result is 10.072, confirming that students who are able to assess risk rationally and have a positive view of risk tend to have higher investment interest. Together, financial literacy and risk perception contribute significantly to investment interest. This is evidenced by the calculated F value of 544.069, which far exceeds the F table, with a significance level of 0.000. The R Square value of 0.733 indicates that around 73.3% of the variation in student investment interest in Medan City can be explained by these two variables. While other factors outside this research model influence the remaining 26.7%. Thus, increasing financial literacy and managing risk perception are key factors in increasing investment interest among students.

This research contributes in the following aspects:

1. Adding to the literature in the field of financial management and investment behavior, especially those related to psychological factors and individual knowledge regarding investment decision making.
2. Providing an overview to educational institutions, governments, and financial institutions regarding the importance of improving financial literacy and providing students with a proper understanding of investment risks.
3. The information and data in this study can be used as a consideration for a more effective financial education program for the younger generation, especially students as potential future investors.

Abstrak

Model video telah muncul sebagai intervensi yang berpotensi bagi individu dengan gangguan spektrum autisme (*autism spectrum disorder*). Ia menyediakan pengalaman pembelajaran yang berstruktur dan menarik secara visual untuk membantu mereka meningkatkan kemahiran sosial, tingkah laku, dan akademik. Kajian sistematik ini menilai keberkesanan, batasan, dan implikasi model video dalam pendidikan autisme. Dapatan kajian menunjukkan bahawa model video membantu meningkatkan interaksi sosial, komunikasi, dan kemahiran hidup berdikari dengan memanfaatkan kekuatan visual individu autisme. Selain itu, model video menawarkan alternatif kepada terapi tradisional yang selalunya memerlukan penjagaan secara satu-satu. Namun, terdapat pelbagai cabaran dalam pelaksanaannya, termasuk had teknologi, isu aksesibiliti, latihan pendidik, dan perbezaan individu dalam kalangan pelajar autisme. Kejayaan model video bergantung kepada penyesuaian kandungan, kaedah penyampaian, dan penglibatan pelajar. Kajian masa depan perlu memberi tumpuan kepada meningkatkan aksesibiliti, menggabungkan teknologi baru seperti kecerdasan buatan (AI), realiti maya (VR), dan realiti campiran (AR), serta membina model pembelajaran adaptif yang disesuaikan dengan keperluan individu.

Kata kunci: Model video; Gangguan spektrum autisme; Pendidikan.

1. Pendahuluan

Individu dengan gangguan spektrum autisme sering menghadapi cabaran besar dalam komunikasi sosial, interaksi, dan pengawalan tingkah laku, yang boleh menghalang perkembangan akademik dan sosial mereka. Pendekatan intervensi tradisional untuk gangguan spektrum autisme selalunya memerlukan sokongan intensif secara individu daripada profesional terlatih, yang boleh menjadi beban sumber dan sukar diakses oleh banyak keluarga (Zhang et al., 2022). Justeru, untuk menangani cabaran ini, penyelidik dan pendidik telah meneroka pelbagai intervensi, termasuk model video; satu teknik yang melibatkan penggunaan video rakaman awal bagi mengajar kemahiran atau tingkah laku tertentu. Kajian sistematik ini bertujuan untuk meneliti literatur sedia ada mengenai penggunaan model video dalam pendidikan autisme, dengan menumpukan kepada cabaran dan implikasi yang berkaitan dengan pendekatan ini.

Model video adalah intervensi berasaskan video yang digunakan secara meluas untuk individu dengan pelbagai ketidakupayaan, termasuk pelajar yang mengalami kesukaran pembelajaran (Kellems & Edwards, 2016; Nurbieta et al., 2022). Model video dikenal pasti sebagai intervensi untuk individu dengan gangguan spektrum autisme kerana ia boleh menyediakan persekitaran pembelajaran yang berstruktur dan boleh diramal, membolehkan pendedahan berulang kepada tingkah laku sasaran, dan meminimumkan tuntutan sosial yang mungkin sukar bagi sesetengah individu dengan gangguan spektrum autisme (Pham et al., 2019). Walau bagaimanapun, pelaksanaan model video dalam pendidikan gangguan

spektrum autisme mesti dipertimbangkan dengan teliti untuk memastikan keberkesanan dan aksesibiliti pendekatan ini. Kajian ini akan mensintesis kajian-kajian lepas mengenai penggunaan model video dalam pendidikan gangguan spektrum autisme, dengan menonjolkan cabaran utama dan implikasi untuk amalan serta penyelidikan masa depan.

Teknologi merujuk kepada penerapan pengetahuan dan prinsip saintifik untuk tujuan praktikal, terutama dalam menyelesaikan masalah dan meningkatkan keupayaan manusia. Dalam konteks pendidikan, teknologi telah memainkan peranan penting dalam mengubah kaedah pengajaran dan pembelajaran. Menurut Persatuan Komunikasi dan Teknologi Pendidikan (Chinwendu & Abraham, 2020), teknologi pendidikan merangkumi amalan etika dalam memudahkan pembelajaran dan meningkatkan prestasi melalui penciptaan, penggunaan, dan pengurusan sumber serta proses teknologi.

Penggunaan teknologi dalam pendidikan merangkumi pelbagai bentuk, daripada media tradisional seperti radio dan televisyen, kepada sistem moden seperti bilik darjah maya dan pembelajaran adaptif. Davies et al. (2014) menegaskan bahawa teknologi bukan sekadar alat, tetapi elemen penting dalam ekosistem pendidikan yang menyokong penglibatan pelajar dan pembelajaran yang diperibadikan.

Kemajuan teknologi maklumat telah melahirkan pendekatan inovatif seperti pembelajaran campuran, bilik darjah terbalik, dan pembelajaran jarak jauh. Menurut kajian terkini oleh Zhao et al. (2023), penggunaan kecerdasan buatan (AI) dan teknologi pembelajaran adaptif dalam bilik darjah telah meningkatkan pencapaian pelajar melalui penyediaan kandungan yang disesuaikan mengikut tahap individu. Selain itu, OECD (2024) melaporkan bahawa penggunaan teknologi secara strategik dapat merapatkan jurang pencapaian antara pelajar bandar dan luar bandar, terutamanya apabila digabungkan dengan latihan profesional kepada guru. Secara keseluruhan, teknologi bukan sahaja memperkasa proses pembelajaran, malah membentuk semula landskap pendidikan untuk menjadi lebih inklusif, berpusatkan pelajar, dan responsif terhadap perubahan global.

Teknologi model video semakin diiktiraf sebagai pendekatan berkesan dalam membantu individu dengan gangguan spektrum autisme menguasai tingkah laku sosial dan kemahiran hidup. Kaedah ini memanfaatkan keupayaan visual individu autisme yang cenderung bertindak balas lebih baik terhadap rangsangan visual berbanding lisan. Melalui pemerhatian video, mereka dapat memahami dan meniru tingkah laku dalam konteks sebenar dengan lebih berkesan (Elhaddadi et al., 2022).

Model video amat berkesan dalam pengajaran kemahiran sosial dan menjadi salah satu cabaran utama individu autisme. Dengan menonton video yang memaparkan interaksi sosial seperti berjabat tangan atau berbual, mereka memperoleh pemahaman dan keyakinan untuk menghadapi situasi sosial sebenar (Saidin, 2024). Selain itu, ciri pembelajaran berulang yang ditawarkan membolehkan pengukuhan tingkah laku secara berterusan (Yunita & Kurniawan, 2025), dan mengurangkan kebimbangan apabila berdepan dengan persekitaran baharu (Saidin et al., 2023).

Terkini, kajian oleh Liu et al. (2024) menunjukkan bahawa penggunaan model video interaktif yang digabungkan dengan realiti tambahan (AR) telah mempercepatkan pemerolehan kemahiran sosial dalam kalangan remaja autisme melalui pendedahan kepada simulasi sosial yang realistik. Sementara itu, kajian meta-analisis oleh Tan & Zulkarnain (2025) mengesahkan keberkesanan pembelajaran berasaskan video dalam pengajaran kemahiran hidup seperti kebersihan diri, penyediaan makanan dan pengurusan masa harian, dengan kadar retensi lebih tinggi berbanding kaedah tradisional.

Model video juga membolehkan pengajaran yang lebih fleksibel dan diperibadikan, kerana kandungan video boleh disesuaikan mengikut tahap kemahiran individu. Ini menyokong perkembangan kendiri dan meningkatkan kualiti hidup secara menyeluruh.

Secara keseluruhan, teknologi model video bukan sahaja meningkatkan keupayaan pembelajaran individu autisme, malah menyokong intervensi jangka panjang yang berkesan dan mesra pengguna dalam pelbagai konteks pendidikan dan terapi.

Autisme, atau gangguan spektrum autisme (ASD), ialah satu keadaan perkembangan neuro kompleks yang memberi kesan kepada komunikasi, interaksi sosial, dan corak tingkah laku individu. Individu dengan ASD sering mengalami kesukaran untuk berinteraksi dan berkomunikasi dengan orang lain, serta menunjukkan tingkah laku berulang dan minat yang terhad. Ciri-ciri ini biasanya muncul pada usia awal kanak-kanak dan boleh memberi kesan jangka panjang terhadap pembelajaran dan kehidupan seharian.

Di Malaysia, autisme diiktiraf sebagai satu bentuk ketidakupayaan di bawah pendaftaran OKU oleh Jabatan Kebajikan Masyarakat. Autisme didefinisikan sebagai gangguan pembelajaran yang menjejaskan keupayaan berinteraksi dan berkomunikasi secara sosial, serta disertai dengan tingkah laku yang tidak tipikal.

Kelaziman autisme dilaporkan semakin meningkat secara global. Menurut Elsabbagh et al. (2021), peningkatan ini berpunca daripada kesedaran masyarakat yang lebih tinggi, kriteria diagnosis yang diperluas, dan akses yang lebih baik kepada perkhidmatan kesihatan mental. Perkembangan teknologi kesihatan mental turut membawa pendekatan baharu dalam pengesanan awal autisme. Ismail et al. (2023) menunjukkan bahawa penggunaan pembelajaran mesin (*machine learning*) dapat meningkatkan ketepatan dan kecekapan dalam mengenal pasti corak awal gangguan autisme berdasarkan data tingkah laku dan biometrik. Kaedah ini sangat penting untuk diagnosis awal yang memungkinkan intervensi lebih cepat dan berkesan.

Tambahan pula, kajian terkini oleh Cheng et al. (2022) mendapati bahawa intervensi awal melalui sokongan digital dan pemantauan berasaskan aplikasi mudah alih dapat membantu ibu bapa dan profesional mengesan gejala awal ASD dengan lebih proaktif, terutama dalam persekitaran komuniti yang kurang akses kepada pakar klinikal.

Secara keseluruhan, autisme merupakan gangguan yang kompleks dan berterusan, tetapi kemajuan dalam teknologi dan sains tingkah laku kini menawarkan peluang yang lebih besar untuk pengesanan awal, intervensi tersusun, dan peningkatan kualiti hidup individu yang terlibat.

Gangguan Spektrum Autisme (ASD) ialah keadaan perkembangan neuro kompleks yang dicirikan oleh kesukaran berterusan dalam komunikasi sosial, interaksi, serta corak tingkah laku yang berulang dan minat yang terhad. ASD dianggap sebagai "spektrum" kerana tahap keterukan dan persembahan gejalanya berbeza-beza antara individu.

Kajian terkini menunjukkan peningkatan ketara dalam kelaziman ASD. Menurut Maenner et al. (2021), di Amerika Syarikat, ASD kini dianggarkan menjejaskan kira-kira 1 dalam 44 kanak-kanak, menunjukkan peningkatan berbanding anggaran sebelumnya. Peningkatan ini sebahagiannya disumbangkan oleh kesedaran yang lebih tinggi, penambahbaikan dalam proses saringan, dan kriteria diagnostik yang lebih luas.

Punca ASD melibatkan gabungan faktor genetik dan persekitaran. Kajian oleh Hodges et al. (2020) dan disokong oleh Satterstrom et al. (2020) mendapati bahawa pelbagai variasi genetic, termasuk mutasi *de novo* dan variasi bilangan salinan (CNV), berkaitan rapat dengan perkembangan ASD. Selain faktor genetik, pengaruh persekitaran seperti komplikasi semasa

kehamilan, jangkitan pranatal, dan faktor metabolik ibu turut dikenalpasti sebagai penyumbang (Hodges et al., 2020).

Dari sudut klinikal, persembahan ASD sangat pelbagai iaitu daripada individu yang memerlukan sokongan intensif kepada mereka yang berfungsi tinggi dengan kemahiran bahasa dan kognitif yang baik. Manual Diagnostik dan Statistik Gangguan Mental edisi kelima (DSM-5) menggabungkan subkategori sebelumnya seperti Sindrom Asperger dan PDD-NOS ke dalam satu diagnosis spektrum bagi menangkap kepelbagaian ini secara lebih holistik.

Diagnosis awal dan intervensi awal terbukti memainkan peranan penting dalam meningkatkan kualiti hidup dan hasil jangka panjang bagi individu dengan ASD. Menurut Zwaigenbaum et al. (2022), intervensi intensif dan pelbagai disiplin yang dimulakan seawal usia dua tahun dapat memperbaiki kemahiran bahasa, komunikasi, dan tingkah laku. Intervensi ini merangkumi terapi tingkah laku berstruktur, terapi pertuturan, terapi carakerja, dan latihan kemahiran sosial yang berasaskan bukti.

Dalam dekad terakhir, intervensi berasaskan teknologi telah berkembang pesat sebagai pendekatan yang efektif dalam menyokong pembelajaran kanak-kanak dengan gangguan spektrum autisme (ASD). Peranti seperti iPad, tablet, dan komputer telah digunakan untuk membina strategi pengajaran yang lebih responsif dan diperibadikan, membolehkan pelajar autisme meneroka, mensimulasikan, dan mempelajari kemahiran asas mengikut tahap dan keperluan mereka (Alpaydın, 2020; Wan Fatimah & Satiakumar, 2022).

Salah satu pendekatan terkini yang semakin mendapat perhatian ialah model video, iaitu strategi pembelajaran berasaskan video yang terbukti berkesan dalam meningkatkan kemahiran komunikasi, sosial, permainan, dan kehidupan harian bagi individu dengan ASD. Kajian oleh Seok et al. (2025) menunjukkan bahawa model video merupakan satu bentuk amalan berasaskan bukti yang kukuh, digunakan secara meluas dalam pendidikan khas untuk pelbagai keperluan perkembangan.

Model video melibatkan penggunaan rakaman video yang memaparkan seseorang mempersembahkan tingkah laku atau kemahiran sasaran, yang kemudiannya ditiru oleh pelajar. Teknik ini berfungsi secara visual, menjadikannya sangat sesuai untuk individu dengan autisme yang lebih responsif terhadap rangsangan visual berbanding lisan. Video juga dapat diulang tayang, membolehkan pengukuhan pembelajaran secara konsisten dan tanpa tekanan sosial secara langsung.

Pendekatan ini menyediakan persekitaran pembelajaran yang terkawal dan boleh diramal, yang sangat bermanfaat bagi individu dengan ASD yang cenderung berkembang dalam rutin yang stabil dan terstruktur. Ia turut mengurangkan beban kognitif serta kebimbangan yang biasa dihadapi dalam persekitaran pembelajaran konvensional. Yu et al. (2020) dan Wan Fatimah & Satiakumar (2022) menekankan bahawa teknik ini boleh disesuaikan dengan pelbagai tahap perkembangan dan keperluan pelajar, menjadikannya fleksibel dan sangat berkesan untuk intervensi jangka panjang.

Jadual 1. Jenis-jenis model video

Jenis model video *(Types of video modelling)*	Penerangan *(Description)*
Model video asas *(Basic video modelling)*	Tingkah laku yang diinginkan dirakam sama ada oleh seorang individu atau rakan sebaya dalam model asas. Selepas itu, kanak-kanak autisme menonton video tersebut untuk mempelajari tindakan atau tugasan tertentu.

Model video kendiri *(Video self-modelling)*	Kanak-kanak autisme melaksanakan tugasan yang diingini untuk ditunjukkan kepada kanak-kanak autisme lain melalui model video kendiri. Pada masa yang lain dalam video tersebut, kanak-kanak akan melihat dirinya sendiri melakukan tugasan itu.
Model video sudut pandangan *(Point-of-view Video Modelling)*	Video dirakam dari perspektif kanak-kanak autisme dan ditunjukkan dalam simulasi video sudut pandangan.
Pemangkinan video *(Video Prompting)*	Apabila mengajar kemahiran langkah demi langkah, pemangkinan video digunakan. Kemahiran yang diingini dipecahkan kepada beberapa tindakan kecil dan video dihentikan seketika selepas setiap tindakan untuk membantu kanak-kanak autisme mempelajari setiap langkah.

Model video ialah kaedah pengajaran berasaskan teknologi yang semakin mendapat perhatian dalam pendidikan individu dengan gangguan spektrum autisme (ASD). Kaedah ini menggunakan rakaman video untuk mempersembahkan tingkah laku atau kemahiran tertentu yang boleh ditiru oleh pelajar autisme dalam suasana yang terkawal dan bebas tekanan. Persekitaran video yang dapat diramal ini membantu mengurangkan rangsangan deria dan tekanan sosial, seterusnya meningkatkan tumpuan terhadap pembelajaran (Zhang, 2022).

Keberkesanan model video telah dibuktikan dalam pelbagai domain kemahiran, termasuk interaksi sosial, komunikasi, kemahiran penyelesaian masalah, dan kemahiran hidup harian. Kajian oleh Seok et al. (2025) menunjukkan bahawa penggunaan model video secara sistematik dapat meningkatkan pemerolehan kemahiran sosial dan kendiri dalam kalangan kanak-kanak dengan autisme. Model ini juga dapat disesuaikan mengikut tahap dan gaya pembelajaran setiap individu, menjadikannya intervensi yang fleksibel dan diperibadikan.

Teknologi terkini seperti realiti maya (VR) turut memperkukuh keberkesanan model video. Kajian oleh Kim & Park (2021) mendapati bahawa penggunaan model video dalam persekitaran maya interaktif membolehkan pelajar autisme melatih kecekapan sosial secara selamat, tanpa kebimbangan terhadap akibat negatif dalam situasi sebenar. Ini sekaligus menyokong pembangunan kemahiran perbualan dan pengawalan emosi dalam konteks simulasi yang realistik.

Walau bagaimanapun, keberkesanan pelaksanaan model video bergantung kepada penyusunan kandungan yang teliti dan penglibatan profesional yang berkelayakan. Intervensi ini perlu dirancang mengikut keperluan individu dan disokong oleh pemantauan berterusan agar hasil pembelajaran dapat dioptimumkan.
Individu dengan gangguan spektrum autisme (ASD) lazimnya menghadapi cabaran dalam komunikasi sosial, interaksi, dan pengawalan tingkah laku, yang boleh menjejaskan kemajuan akademik dan kesejahteraan sosial mereka. Kaedah intervensi konvensional sering memerlukan sokongan intensif dan berterusan daripada profesional terlatih, yang mungkin membebankan dari segi kos dan sumber serta sukar diakses dalam sesetengah komuniti.

Sebagai alternatif, model video telah muncul sebagai pendekatan intervensi yang efektif dan praktikal untuk pendidikan autisme. Teknik ini menggunakan rakaman video yang memaparkan tingkah laku atau kemahiran sasaran untuk ditiru oleh pelajar. Menurut kajian oleh Zhang et al. (2022), model video memberikan persekitaran pembelajaran yang terstruktur, mengurangkan tekanan sosial, dan membenarkan pengulangan kendiri, ciri-ciri yang amat sesuai dengan keperluan pelajar autisme.

Namun begitu, pelaksanaan model video juga mempunyai cabaran tersendiri. Kajian oleh Yunita & Kurniawan (2025) melaporkan beberapa halangan utama, termasuk kekurangan penYauaian kandungan video mengikut tahap perkembangan pelajar, keperluan pemantauan berterusan oleh guru atau ibu bapa, serta isu akses kepada teknologi dan infrastruktur digital, terutamanya dalam kalangan komuniti luar bandar atau berpendapatan rendah.

Tambahan pula, kajian sistematik oleh Seok et al. (2025) menekankan bahawa keberkesanan model video banyak bergantung kepada kualiti penyampaian, kesesuaian konteks pembelajaran, dan penglibatan aktif daripada pelajar dan fasilitator. Mereka mencadangkan perlunya garis panduan pelaksanaan yang jelas serta latihan profesional kepada pendidik bagi memastikan intervensi ini dimanfaatkan sepenuhnya.

Kajian-kajian terkini ini menunjukkan bahawa model video berpotensi besar sebagai alat pendidikan dan intervensi dalam kalangan individu dengan ASD, tetapi memerlukan pelaksanaan yang strategik dan disesuaikan dengan keperluan individu serta realiti pendidikan semasa.

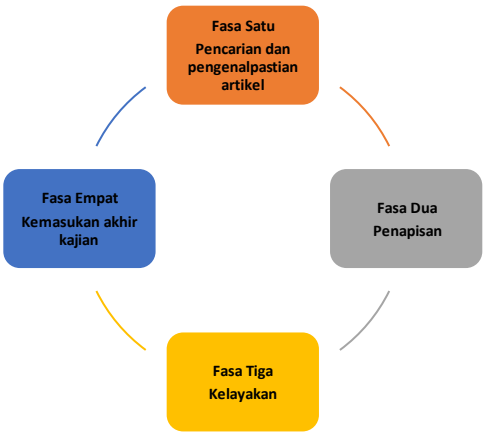
2. Metodologi

Item Pelaporan Pilihan untuk Kajian Sistematik dan Meta-Analisis (PRISMA)
Preferred Reporting Items for Systematic Review and Meta-Analyses (PRISMA)

Kajian ini mengikuti PRISMA 2020 (Page et al., 2021) untuk memastikan ketelusan dan kebolehpercayaan dalam tinjauan sistematik dan meta-analisis. PRISMA menyediakan kerangka sistematik untuk pencarian, penapisan, penilaian, dan sintesis kajian lepas, khususnya berkaitan intervensi model video untuk gangguan spektrum autisme.
Proses PRISMA:

- Pencarian & Pengenalpastian – Artikel relevan dikenal pasti melalui pangkalan data akademik.
- Penapisan – Artikel disaring berdasarkan kriteria kemasukan (contoh: penerbitan selepas 2020).
- Kelayakan – Kajian dinilai secara kritis untuk kualiti dan relevansi.
- Kemasukan – Hanya artikel terpilih dianalisis bagi menjawab objektif kajian.

Pendekatan ini memastikan sintesis bukti empirikal yang kukuh dan terkini, selaras dengan kajian sistematik (Shaffril et al., 2021; Nurul & Shahabuddin, 2023).



Rajah 1. Carta aliran model PRISMA

Kajian ini menilai literatur terkini yang disemak rakan sebaya dalam bahasa Inggeris antara tahun 2020 hingga 2025, berkaitan penggunaan pemodelan video sebagai intervensi pendidikan untuk kanak-kanak dan remaja dengan gangguan spektrum autisme (ASD). Artikel yang dipilih memenuhi kriteria berikut:

a) Populasi: Kajian melibatkan kanak-kanak atau remaja berumur antara 4 hingga 19 tahun, selaras dengan julat umur pendidikan formal.
b) Diagnosa: Peserta mestilah telah didiagnosis secara rasmi dengan gangguan spektrum autisme, mengikut takrifan yang diiktiraf seperti DSM-5 atau piawaian Kementerian Kesihatan/Kementerian Pendidikan.
c) Jenis Intervensi: Kajian mesti menilai model video sebagai intervensi berasaskan bukti yang digunakan untuk meningkatkan pelbagai kemahiran termasuk sosial, komunikasi, atau kawalan tingkah laku.
d) Penyertaan Aktif: Intervensi perlu melibatkan penyertaan langsung kanak-kanak atau remaja dalam proses pembelajaran melalui video.
e) Reka Bentuk Kajian: Kajian yang menggunakan pendekatan kuantitatif, kualitatif, atau reka bentuk campuran akan dipertimbangkan. Kajian tinjauan (scoping reviews), ulasan naratif atau sistematik lain tanpa data primer akan dikecualikan.
f) Hasil Kajian: Kajian perlu menilai pembolehubah hasil yang relevan, seperti perubahan dalam kemahiran sosial, tingkah laku adaptif, interaksi komunikasi, atau keberkesanan intervensi video secara keseluruhan.

Kajian-kajian terpilih termasuk intervensi yang memanfaatkan model video sebagai alat pedagogi yang menyokong pembelajaran berstruktur dan berulang, seperti dibuktikan oleh Zhang et al. (2022) dan Castro et al. (2021) yang menunjukkan peningkatan ketara dalam kemahiran sosial dan pematuhan arahan dalam kalangan murid ASD. Kajian Alzrayer & Banda (2023) turut menyokong keberkesanan video modeling dalam pengajaran kendiri dan pengurangan tingkah laku mencabar.

Artikel untuk ulasan literatur sistematik ini dikenal pasti melalui *Springer Nature Link* dan *Google Scholar*. Penyelidik telah menggunakan pelbagai istilah yang menekankan cabaran dan impak penggunaan pemodelan video sebagai intervensi. Tahap awal carian artikel melibatkan identifikasi artikel atau jurnal dengan menggunakan kata kunci dalam bahasa Melayu dan bahasa Inggeris. Jadual 2 menunjukkan susunan hasil carian artikel berdasarkan kata kunci yang berkaitan dalam dua pangkalan data yang boleh diakses.

Jadual 2. Carian artikel berdasarkan kata kunci

Pangkalan Data	Kata Kunci (Bahasa Melayu)	Kata Kunci (Bahasa Inggeris)
Springer Nature Link	"Pemodelan video autisme"	"Video modelling autism"
	"Intervensi kanak-kanak autisme"	"Autism intervention children"
Google Scholar	"Strategi pembelajaran autisme"	"Learning strategies autism"
	"Pemodelan tingkah laku video"	"Behavior video modelling"

Seterusnya, selepas carian artikel dalam Fasa 1: Identifikasi artikel atau jurnal, penyelidik akan memilih artikel untuk dinilai dalam Fasa 2: Penapisan. Dalam fasa ini, artikel yang diperoleh daripada dua pangkalan data akan dinilai mengikut kriteria pemilihan yang telah ditentukan. Artikel yang dimuat turun dipilih berdasarkan kriteria inklusi, termasuk:

Akses terbuka (*open access*) untuk memastikan artikel boleh diakses tanpa bayaran.
Berkaitan dengan sains sosial dan sains kesihatan, khususnya dalam konteks pendidikan dan intervensi autisme.
Memberi tumpuan kepada cabaran dan implikasi pemodelan video sebagai kaedah intervensi dalam pendidikan autisme.
Jumlah artikel yang disaring:
Sebelum saringan: 1,314 artikel dari *Springer Nature Link* dan 711 artikel dari *Google Scholar.*

Selepas saringan: 173 artikel dari *Springer Nature Link* dan 142 artikel dari *Google Scholar.*

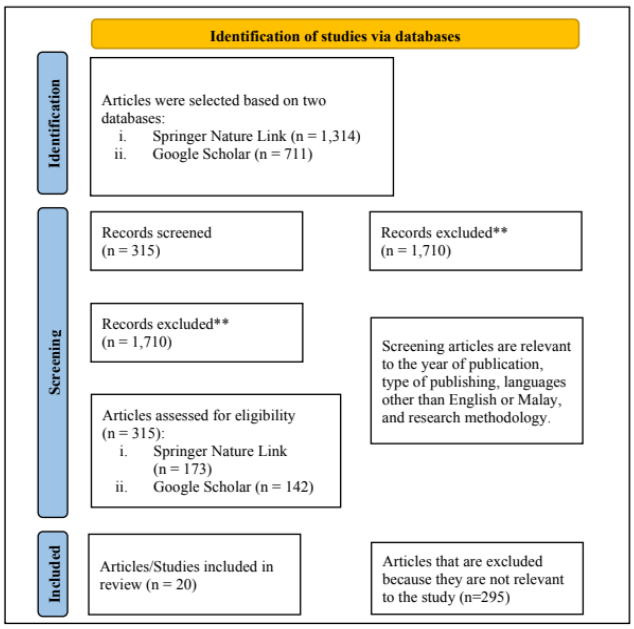
Jadual 3 akan menunjukkan dengan lebih terperinci kriteria inklusi untuk pemilihan artikel dalam kajian ini.

Jadual 3. Kriteria Kemasukan untuk Pemilihan Artikel

Kriteria Kemasukan	Kriteria Pengecualian
Jenis Artikel	Artikel penyelidikan/jurnal
Tahun Penerbitan	2020 hingga 2025
Bahasa	Bahasa Inggeris atau Bahasa Melayu
Kaedah Penyelidikan	Kajian kualitatif, kajian kuantitatif, kaedah campuran

Dalam Fasa 3: Penilaian kelayakan artikel/jurnal terpilih, penyelidik menilai artikel yang berkaitan berdasarkan kesesuaian dengan objektif kajian dan kata kunci. Sepanjang proses saringan dalam fasa kelayakan ini, 295 artikel telah ditolak kerana tidak memenuhi kriteria yang ditetapkan. Akhirnya, 20 artikel dipilih untuk dimasukkan ke dalam ulasan literatur sistematik ini kerana relevansi yang ketara dengan objektif kajian.

Rajah 2 menunjukkan prosedur pemilihan artikel yang mengikuti empat (4) fasa berdasarkan model PRISMA. Artikel tersebut diperoleh daripada dua pangkalan data utama iaitu Springer Nature Link dan Google Scholar. Penyelidik berjaya mengumpulkan 20 artikel yang relevan dengan matlamat dan kandungan kajian, yang akan digunakan sebagai bahan perbincangan dalam kajian ini.



Rajah 2. Prosedur pemilihan artikel mengikuti empat fasa berdasarkan model PRISMA

Di dalam Fasa 3: Penilaian artikel/jurnal terpilih, artikel yang telah melepasi saringan akan dinilai dengan lebih teliti berdasarkan kualiti metodologi, kesesuaian intervensi, serta hasil yang dilaporkan. Penilaian akan menitikberatkan relevan kajian dengan objektif penyelidikan, reka bentuk kajian sama ada kuantitatif, kualitatif, atau campuran dan kebolehpercayaan data serta bukti sokongan untuk pemodelan video sebagai intervensi dalam pendidikan autisme.

Hanya artikel yang memenuhi kriteria ketat ini akan beralih ke Fasa 4: Termasuk/Pemilihan akhir artikel/jurnal.

Dalam Fasa 4: Termasuk/Pemilihan artikel/jurnal akhir, hanya artikel yang memenuhi semua kriteria akan dimasukkan dalam analisis akhir. Tujuannya adalah untuk memastikan hasil kajian ini berdasarkan sumber yang sahih, berkualiti tinggi, dan relevan dengan penggunaan pemodelan video dalam pendidikan autisme. Hasil akhir akan Menyusun jumlah artikel yang dipilih berdasarkan pangkalan data, kategori intervensi sama ada fokus pada kemahiran sosial, komunikasi, atau tingkah laku dan metodologi kajian yang digunakan, seperti eksperimen, kajian lapangan, atau kajian kendiri.

3. Dapatan dan Perbincangan

Sebanyak 2,205 kajian telah dikenal pasti. Selepas 1,710 kajian duplikasi dikeluarkan, 315 kajian kekal untuk dinilai. Kajian-kajian ini ditapis berdasarkan tajuk dan abstrak, dan 1,710 artikel yang tidak memenuhi kriteria kemasukan dan pengecualian (rujuk Jadual 3) telah dikecualikan. Daripada 315 artikel yang mara ke fasa penilaian teks penuh akhir, 295 artikel lagi dikecualikan kerana gagal memenuhi kriteria yang ditetapkan. Akhirnya, 20 artikel dipilih untuk dimasukkan ke dalam fasa akhir ulasan sistematik ini. Jadual 4 akan memaparkan ringkasan aspek utama bagi setiap kajian.

Penilaian kualiti dijalankan menggunakan alat penilaian yang sesuai untuk kajian tinjauan sistematik dan sintesis penyelidikan, dikenali sebagai Joanna Briggs Institute Critical Appraisal Checklist (JBI) (Jordan et al., 2019). Alat penilaian ini menilai kualiti kajian berdasarkan sebelas kriteria, termasuk menjelaskan kriteria kemasukan sampel, mengenal pasti dan mengurus faktor perancu dan memastikan hasil kajian adalah tepat dan sah. Setiap kriteria dinilai dengan pilihan jawapan: "ya", "tidak", "tidak jelas", dan "tidak relevan". Kajian yang mendapat 6 atau lebih jawapan "ya" dianggap sebagai kajian berkualiti tinggi. Oleh itu, hanya kajian yang mendapat 6 atau lebih akan dimasukkan dalam tinjauan ini (Burks et al., 2021; Milea et al., 2024). Jadual 5 menunjukkan penilaian berdasarkan pemarkahan kualiti bagi 20 penerbitan yang dipilih untuk kajian ini.

Jadual 4. Hasil aspek asas setiap kajian

Pengarang (Tahun)	Jumlah (N)	Kaedah/Reka Bentuk	Objektif Kajian	Intervensi	Keputusan	Kesimpulan
Alhuzimi (2020)	N=6 (4 kanak-kanak gangguan spektrum autisme berusia 8 hingga 12 tahun & 2 guru dari sekolah khas)	Reka bentuk pelbagai asas dengan eksperimen, temu bual & pemerhatian	Menyelidik keberkesanan intervensi model video dalam meningkatkan dua kemahiran sosial tertentu dalam kalangan kanak-kanak lelaki dengan gangguan spektrum autisme di persekitaran pendidikan khas: bermain dengan rakan sebaya dan memberi salam di sekolah.	Intervensi model video selama 18 minggu untuk membangunkan kemahiran sosial.	Hasil menunjukkan model video asas memberi kesan positif terhadap kemahiran sosial pelajar dengan gangguan spektrum autisme.	Model video berkesan dalam membangunkan tingkah laku sasaran dalam kalangan kanak-kanak autisme yang terlibat.
Rizki et al. (2024)	N=10 kanak-kanak dengan gangguan spektrum autisme (berumur 6-13 tahun)	Reka bentuk eksperimen subjek tunggal	Menilai kesan model video kendiri (VSM) dalam meningkatkan keupayaan kanak-kanak dengan gangguan spektrum autisme untuk memberus gigi sendiri.	Eksperimen pra dan pasca menggunakan model video kendiri untuk latihan memberus gigi.	Hasil kajian menunjukkan model video kendiri secara signifikan meningkatkan keupayaan memberus gigi secara berdikari dalam kalangan kanak-kanak dengan gangguan spektrum autisme.	Model video kendiri berkesan membantu kanak-kanak autisme membangunkan kemahiran tingkah laku dan intelektual.
Yakubova et al. (2023)	N=1 kanak-kanak dengan gangguan spektrum autisme (5 tahun)	Reka bentuk kajian eksperimen kes tunggal dengan pelbagai uji kemahiran	Mengkaji keberkesanan pengajaran kemahiran matematik seperti tambah, banding nombor, dan tolak kepada seorang kanak-kanak autisme berusia 5 tahun menggunakan pakej intervensi model video.	Persekitaran maya serentak menyampaikan pakej intervensi model video yang merangkumi manipulatif maya dan pembetulan kesilapan	Kajian menunjukkan kanak-kanak dengan gangguan spektrum autisme mendapat manfaat daripada menonton model video dalam talian semasa belajar matematik. Penemuan utama termasuk peningkatan kemahiran matematik, interaksi positif, dan pengurangan tahap kebimbangan.	Model video dalam talian adalah sumber yang berguna untuk mengajar matematik kepada kanak-kanak autisme. Video ini menawarkan kaedah yang lebih mudah dan berkesan untuk membantu kanak-kanak autisme yang bergelut memahami konsep matematik asas.

Egarr & Storey (2022)	N = 4 kanak-kanak (8-15 tahun) dengan gangguan spektrum autisme	Reka bentuk subjek tunggal, rawatan berselang-seli (ATD)	Menentukan kesan pemodelan video terhadap kefasihan membaca pelajar dengan gangguan spektrum autisme	1. Pemodelan video menggunakan guru sebagai model. 2. Pemodelan video "feedforward self-modelling" (FFVSM) di mana pelajar bertindak sebagai model.	Peningkatan kefasihan membaca diperhatikan pada 2 peserta.	FFVSM berkesan apabila pelajar melihat model yang serupa dengan mereka.
Kellems et al. (2020)	N = 6 orang dewasa muda (18-20 tahun) dengan gangguan spektrum autisme & kecacatan intelektual	Reka bentuk asas pelbagai pasangan (baseline across dyads)	Mengkaji kesan arahan eksplisit, pemodelan video, dan maklum balas video dalam mengajar kemahiran memulakan perbualan	Pemodelan video dan maklum balas video	5 daripada 6 peserta mengekalkan kemahiran memulakan perbualan dalam jangka panjang.	Intervensi ini berkesan dan peserta suka menonton video mereka sendiri dan video model.
Dogan (2023)	N = 1 (remaja lelaki, 16 tahun) dengan gangguan spektrum autisme	Reka bentuk prob pelbagai dalam kajian kes tunggal	Menilai keberkesanan pemodelan video maya untuk mengajar kemahiran kehidupan harian asas	Pemodelan video perspektif orang pertama oleh pelajar berusia 17 tahun yang berkembang tipikal	Peserta mempelajari, mengekalkan, dan mengaplikasikan kemahiran harian (memasak sup segera, menyediakan meja, memasukkan pinggan kotor ke mesin basuh pinggan)	Pemodelan video berkesan dalam mengajar 3 kemahiran kehidupan harian kepada remaja dengan gangguan spektrum autisme.

Thull (2024)	N = 1 (pelajar lelaki, 19 tahun) dengan gangguan spektrum autisme	Kajian kes tunggal (pemerhatian dan nota lapangan)	Menghasilkan "Video-Based Instruction" (VBI) untuk membantu pelajar dengan gangguan spektrum autisme melaksanakan aktiviti secara berdikari dalam persekitaran kerja komuniti	VBI dihasilkan dengan kamera dan aplikasi gambar iPad, menunjukkan langkah-langkah penyediaan kopi	Peserta berjaya melaksanakan setiap langkah penyediaan kopi secara berdikari	VBI menggunakan iPad adalah pendekatan pengajaran yang praktikal untuk pembangunan kerjaya individu dengan gangguan spektrum autisme.
Elhaddadi et al. (2022)	N = 18 (kanak-kanak dengan gangguan spektrum autisme, 5-8 tahun)	Kaedah eksperimen dengan dua kumpulan eksperimen. Menggunakan tiga alat ukur: Skala Kemahiran Bermain, Ujian Matriks Progresif Raven, dan Skala Penilaian Autisme Kanak-kanak (CARS).	Menilai keberkesanan dua program: pemodelan video dan tiruan berulang dalam mengajar kemahiran bermain kepada kanak-kanak autisme.	Pemodelan video dan tiruan berulang	Kedua-dua teknik meningkatkan kemahiran bermain dengan tahap kemajuan berbeza bergantung pada umur, tahap autisme, dan jenis program.	Pemodelan video lebih berkesan kerana ia menggunakan arahan sistematik dengan setiap kemahiran dipecahkan kepada langkah kecil yang mudah difahami.
Ohanele (2024)	N = 90 (kanak-kanak dengan gangguan spektrum autisme, 9-13 tahun)	Pendekatan kuasi-eksperimen dengan reka bentuk kumpulan kawalan praujian-pascaujian	Mengkaji kesan pemodelan video dan arahan langsung terhadap kemahiran sosial pelajar autisme tahap 1.	Pemodelan video dan arahan langsung	Kumpulan pemodelan video mencapai skor purata lebih tinggi (60.70) berbanding kumpulan arahan langsung (50.09).	Pemodelan video dan arahan langsung berkesan untuk mengajar kemahiran sosial bagi pelajar pada semua tahap spektrum dan individu kurang upaya lain.

Lee et al. (2022)	N = 4 (kanak-kanak dengan gangguan spektrum autisme, 4.5-5 tahun)	Reka bentuk eksperimen dengan rawatan berselang-seli untuk menilai hasil pembelajaran pemodelan video dan intervensi berasaskan gambar (PI).	Menyiasat kesan pemodelan video dan intervensi berasaskan gambar dalam melatih kanak-kanak autisme mengenal pasti emosi dalam konteks.	Pemodelan video dan intervensi berasaskan gambar	Semua kanak-kanak memberi respon positif dan menikmati sesi pembelajaran. 3 daripada 4 kanak-kanak lebih tepat dengan pemodelan video berbanding PI.	Kedua-dua kaedah berkesan, tetapi pemodelan video lebih memberi ketepatan dalam memahami emosi.
Lee et al. (2022)	N = 4 (kanak-kanak dengan gangguan spektrum autisme, 4.5-5 tahun)	Reka bentuk eksperimen dengan rawatan berselang-seli untuk menilai hasil pembelajaran pemodelan video dan intervensi berasaskan gambar (PI).	Menyiasat kesan pemodelan video dan intervensi berasaskan gambar dalam melatih kanak-kanak autisme mengenal pasti emosi dalam konteks.	Pemodelan video dan intervensi berasaskan gambar	Semua kanak-kanak memberi respon positif dan menikmati sesi pembelajaran. 3 daripada 4 kanak-kanak lebih tepat dengan pemodelan video berbanding PI.	Kedua-dua kaedah berkesan, tetapi pemodelan video lebih memberi ketepatan dalam memahami emosi.
Bell (2022)	N = 6 (kanak-kanak dengan gangguan spektrum autisme, 6-12 tahun)	Reka bentuk garis dasar pelbagai peserta	Mengkaji kesan mengajar kemahiran pencegahan penculikan kepada kanak-kanak autisme menggunakan pemodelan video.	Intervensi pemodelan video untuk mengajar reaksi yang betul apabila didekati oleh penculik berpotensi	Semua kanak-kanak menunjukkan peningkatan dalam reaksi yang betul terhadap situasi penculikan secara nyata dan dalam video.	Pemodelan video berkesan untuk mendorong kanak-kanak autisme bertindak balas dengan betul terhadap ancaman penculikan.

Petursdottir & Gudmundsdottir (2023)	N = 4 (kanak-kanak dengan gangguan spektrum autisme, 4-5 tahun)	Reka bentuk eksperimen (kajian subjek tunggal dengan probe berganda merentas peserta)	Menilai kesan pemodelan video mudah alih terhadap interaksi sosial kanak-kanak autisme.	Peranti mudah alih (iPod Touch®) dengan fungsi rakaman dan main balik video digunakan untuk pemodelan video	Peningkatan interaksi sosial antara kanak-kanak autisme prasekolah dengan rakan sebaya mereka.	Pemodelan video dengan peranti mudah alih berkesan membantu kanak-kanak prasekolah autisme memperoleh dan mengaplikasikan kemahiran sosial dalam persekitaran sebenar.
Piraneh et al. (2022)	N = 137 (pelajar lelaki dengan ASD, 7-15 tahun)	Reka bentuk eksperimen kuasi rawak (Penilaian susulan dengan soal selidik)	Mengkaji keberkesanan dua intervensi pendidikan memberus gigi terhadap status kebersihan mulut pelajar ASD, diukur dengan Indeks Kebersihan Mulut Ringkas (OHI-S).	Latihan memberus gigi berasaskan pemodelan video	Kedua-dua program pendidikan meningkatkan kebersihan mulut dan pengetahuan ibu bapa.	Latihan memberus gigi melalui pemodelan video lebih berkesan berbanding kaedah bercerita sosial biasa.
Bross et al. (2020)	N = 5 (belia dewasa muda dengan ASD)	Kajian reka bentuk kes tunggal	Mengkaji kesan intervensi pemodelan video terhadap kemahiran perkhidmatan pelanggan lima belia dengan ASD.	Pemodelan video untuk kemahiran perkhidmatan	Pemodelan video berkesan meningkatkan kualiti interaksi perkhidmatan.	Pemodelan video membantu memperbaiki ucapan salam, layanan, dan ucapan penutup dalam konteks pekerjaan.
Edwards et al. (2020)	N = 5 (pelajar sekolah menengah dengan ASD, 16-17 tahun)	Reka bentuk probe berganda subjek tunggal	Menilai kesan pemodelan video pada iPad terhadap kemahiran matematik fungsi pelajar remaja ASD ringan hingga sederhana.	Video pada iPad menunjukkan cara mengira harga selepas diskaun	Hubungan fungsian ditunjukkan antara intervensi dan penguasaan langkah pengiraan.	Pemodelan video berkesan mengajar teknik matematik kepada remaja dengan ASD atau kesukaran pembelajaran.
Stauch & Plavnick (2020)	N = 2 (remaja dengan ASD)	Reka bentuk probe berganda merentas tingkah laku	Menilai keberkesanan pemodelan video dalam mengajar kemahiran sosial dan vokasional di persekitaran seperti pekerjaan.	Pemodelan video 1-3 kali seminggu selama lebih kurang 2 jam setiap sesi	Pemodelan video berkesan mengajar kemahiran vokasional.	Pemodelan video terbukti berkesan untuk melatih kemahiran vokasional.

Akmanoğlu & Pektaş-Karabekir (2020)	N = 3 (kanak-kanak lelaki dengan ASD, 5-6 tahun)	Reka bentuk probe berganda merentas subjek	Menentukan keberkesanan pemodelan video pendek menggunakan iPad dalam mengajar kanak-kanak ASD melukis.	Pemodelan video pendek melalui iPad	Pemodelan video pendek melalui iPad meningkatkan hasil pembelajaran kanak-kanak.	Pemodelan video pendek sesuai untuk melatih kemahiran melukis.
Aljehany & Bennett (2020)	N = 3 (pelajar menengah dengan ASD, 12-15 tahun)	Reka bentuk eksperimen (meneroka kaedah)	Menentukan sama ada Pemodelan Video atau Prompting Paling-Sedikit-Ke-Paling berkesan untuk mengajar tugas pejabat kepada pelajar ASD.	Perbandingan Pemodelan Video dengan Prompting Paling-Sedikit-Ke-Paling	Intervensi pemodelan video lebih cekap berbanding prompting paling-sedikit-ke-paling.	Pemodelan video lebih berkesan dan menjimatkan masa.
Ayvazo et al. (2024)	N = 3 (pelajar dengan ASD, 16-18 tahun)	Reka bentuk eksperimen	Menyelidik intervensi yang mensasarkan keperluan perbualan remaja dengan ASD.	Intervensi pemantauan kendiri dengan sokongan pemodelan video	Semua peserta menunjukkan peningkatan tingkah laku perbualan secara konsisten.	Pemantauan kendiri dengan video berkesan membantu remaja ASD meningkatkan kemahiran berbual.
Wu (2023)	N = 3 (pelajar dengan ASD, 10-11 tahun)	Reka bentuk eksperimen	Membangunkan dan mengesahkan model pengajaran yang menggunakan realiti tambahan dan pemodelan video untuk meningkatkan ketepatan menyelesaikan masalah matematik.	Pemodelan video dengan model pengajaran realiti tambahan	Model pemodelan video dengan realiti tambahan menawarkan pendekatan alternatif.	Model ini membantu kanak-kanak dengan ketidakupayaan perkembangan meningkatkan kemahiran menyelesaikan masalah matematik.

Item daripada *Joanna Briggs Institute Critical Appraisal Checklist* (JBI) adalah seperti berikut:

Item 1: Adakah soalan kajian dinyatakan dengan jelas dan eksplisit?
Item 2: Adakah kriteria kemasukan sesuai untuk soalan kajian?
Item 3: Adakah strategi pencarian sesuai?
Item 4: Adakah sumber dan bahan yang digunakan untuk mencari kajian mencukupi?
Item 5: Adakah kriteria untuk menilai kajian sesuai?
Item 6: Adakah penilaian kritikal dijalankan secara bebas oleh dua atau lebih penilai?
Item 7: Adakah terdapat kaedah untuk meminimumkan ralat dalam pengekstrakan data?
Item 8: Adakah kaedah yang digunakan untuk menggabungkan kajian sesuai?
Item 9: Adakah kemungkinan bias penerbitan dinilai?
Item 10: Adakah cadangan untuk dasar dan/atau amalan disokong oleh data yang dilaporkan?
Item 11: Adakah arahan khusus untuk penyelidikan baharu sesuai?

Artikel penyelidikan yang telah dianalisis menunjukkan bahawa intervensi pemodelan video sangat relevan, dan secara tidak langsung hasil kajian ini menyokong penemuan penyelidikan terdahulu. Objektif utama semua kajian yang termasuk dalam ulasan ini adalah untuk

menganalisis dan menilai manfaat, batasan, dan kesan praktikal pemodelan video sebagai alat pendidikan dan intervensi bagi individu dengan gangguan spektrum autisme (ASD). Tambahan pula, semua kajian yang dimasukkan adalah berkualiti tinggi, dengan skor 6 atau lebih berdasarkan *Joanna Briggs Institute Critical Appraisal Checklist* (JBI).

Selain itu, hasil intervensi menunjukkan bahawa pemodelan video asas boleh memberi kesan positif ke atas kemahiran sosial pelajar ASD. Pemodelan video terbukti berkesan dalam membentuk tingkah laku sasaran pada kanak-kanak ASD (Alhuzimi, 2020; Rizki et al., 2024). Namun, setiap individu ASD adalah unik dengan kekuatan dan cabaran tersendiri. Oleh itu, tiada pendekatan "satu saiz sesuai untuk semua" dalam terapi dan intervensi autisme (Autism Speaks, 2019; Alhuzimi, 2020). Hal ini menjadikan pelbagai proses dan intervensi, termasuk pemodelan video, terus dikaji.

Pemodelan video juga membantu kanak-kanak dan remaja ASD meningkatkan kemahiran sosial serta tingkah laku. Ayvazo et al. (2024) menyatakan bahawa pemantauan kendiri yang digabungkan dengan terapi berasaskan video adalah teknik berkesan untuk meningkatkan kemahiran perbualan dalam kalangan remaja ASD. Model berasaskan video memberi contoh visual kepada peserta untuk memahami dan meniru tabiat perbualan yang sesuai. Kajian ini menekankan keperluan menggabungkan beberapa strategi intervensi, seperti pemantauan kendiri dan pemodelan video, untuk membantu pembangunan kemahiran sosial remaja ASD agar mereka lebih cekap dalam interaksi sosial.

Walaupun terdapat penemuan positif, Stauch dan Plavnick (2020) telah mengenal pasti beberapa cabaran. Salah satu cabaran utama adalah memastikan kandungan video menarik dan sesuai dengan keperluan unik setiap remaja. Beberapa peserta mungkin mempunyai gaya pembelajaran yang berbeza atau bertindak balas lebih baik kepada model video tertentu.

Cabaran lain adalah memastikan generalisasi kemahiran di luar situasi latihan video. Walaupun terdapat peningkatan dalam keadaan berstruktur, usaha lebih lanjut diperlukan untuk memastikan remaja boleh menggunakan kemahiran mereka dalam situasi dunia nyata yang tidak berstruktur. Selain itu, teknologi mungkin menjadi halangan bagi sesetengah individu atau situasi yang kekurangan akses kepada peralatan atau sokongan asas.

Namun, Kellems et al. (2020) menyatakan bahawa pemodelan video sebagai intervensi dalam latihan kemahiran sosial memberikan implikasi besar, terutama untuk individu ASD. Kajian ini merumuskan bahawa pemodelan video adalah cara yang realistik dan berkesan untuk membangunkan kemahiran perbualan yang sering menjadi cabaran bagi individu ASD. Penemuan ini menunjukkan bahawa terapi berasaskan video boleh digunakan dalam pelbagai konteks, termasuk program latihan vokasional, pusat komuniti, dan program kediaman untuk membantu individu ASD meningkatkan kemahiran sosial mereka.

Kajian ini menunjukkan bahawa penggunaan pemodelan video mempunyai potensi besar dalam membantu pelajar dengan gangguan spektrum autisme (ASD) meningkatkan kemahiran sosial, tingkah laku, dan pembelajaran akademik. Bagi pendidik, implikasinya adalah keperluan untuk mempelbagaikan pendekatan pengajaran yang melibatkan teknologi, termasuk penggunaan video sebagai alat intervensi yang bersifat visual dan berstruktur. Ini membantu guru menyampaikan maklumat dengan lebih jelas, terutamanya kepada pelajar ASD yang cenderung memahami melalui pemerhatian. Sementara itu, pelajar mendapat manfaat melalui pendedahan kepada situasi pembelajaran yang konsisten dan boleh diulang, sekaligus membina keyakinan diri serta memperbaiki interaksi sosial.

Bagi kajian masa depan, penyelidikan disarankan menumpukan kepada meningkatkan aksesibiliti teknologi dalam komuniti berpendapatan rendah serta menyesuaikan pemodelan video mengikut keperluan dan gaya pembelajaran individu. Kajian juga boleh meneroka penggunaan teknologi canggih seperti AI, AR, dan VR bagi mencipta persekitaran

pembelajaran yang lebih interaktif. Di samping itu, pemodelan video boleh diperluas untuk kemahiran akademik, vokasional dan kendiri, bukan sekadar sosial. Penyelidikan lanjut dapat membantu menjadikan pendekatan ini sebagai satu intervensi jangka panjang dan inklusif, dengan memastikan ia sesuai digunakan merentas pelbagai latar sosioekonomi dan budaya.

4. Kesimpulan

Kajian ini mengesahkan bahawa pemodelan video merupakan pendekatan pengajaran yang berkesan dalam membantu individu dengan gangguan spektrum autisme (ASD), khususnya dalam meningkatkan kemahiran komunikasi sosial, tingkah laku positif, dan pencapaian akademik. Pendekatan ini sangat sesuai untuk pelajar ASD yang memerlukan pembelajaran secara visual, berstruktur, dan berulang. Implikasinya terhadap dunia pendidikan adalah besar, di mana pendidik dapat memanfaatkan teknologi ini untuk menyampaikan kandungan pembelajaran dengan lebih berkesan dan menarik. Potensi untuk menggabungkan pemodelan video dengan teknologi moden seperti AI, AR dan VR juga membuka ruang baharu dalam penyediaan persekitaran pembelajaran yang lebih imersif dan disesuaikan. Namun, kajian ini mempunyai beberapa limitasi, termasuk kebergantungan kepada akses teknologi, kekurangan latihan khusus untuk pendidik, keperluan penyesuaian yang kompleks untuk variasi individu, dan fokus kajian sedia ada pada kesan jangka pendek. Limitasi ini menekankan keperluan penyelidikan lanjut untuk meningkatkan aksesibiliti, latihan guru, pendekatan diperibadikan, dan penilaian jangka panjang.

KEBERKESANAN PELAKSANAAN KURSUS PASTRI DAN PEMPROSESAN MAKANAN LEMBAGA KEMAJUAN PERTANIAN MUDA (MADA) DI KOLEJ KOMUNITI BANDAR DARUL AMAN

Noor Ain Mohd Faudzi*, Seri Wati Said

Kolej Komuniti Bandar Darul Aman, 06000 Jitra, Kedah

*Alamat e-mel penulis: noorain.faudzi@kkbda.edu.my

Abstrak

Kajian ini bertujuan menilai keberkesanan Kursus Pastri dan Pemprosesan Makanan yang dilaksanakan oleh Kolej Komuniti Bandar Darul Aman (KKBDA) kepada usahawan di bawah bimbingan MADA Kedah. Kajian berbentuk kuantitatif ini menggunakan reka bentuk tinjauan melalui edaran soal selidik kepada peserta yang terlibat. Data yang dikumpul dianalisis secara deskriptif menggunakan perisian SPSS bagi mendapatkan gambaran menyeluruh melalui peratusan, skor min dan sisihan piawai. Hasil kajian menunjukkan bahawa keseluruhan komponen yang dinilai iaitu perancangan program, pelaksanaan, penilaian pengajar serta pengurusan urus setia telah mencapai tahap keberkesanan yang tinggi. Peserta memberikan maklum balas yang sangat positif terhadap kesesuaian kandungan kursus, keberkesanan penyampaian, dan kecekapan pengurusan kursus. Selain itu, kursus ini juga didapati berjaya meningkatkan pengetahuan, kemahiran teknikal, keyakinan diri serta potensi keusahawanan dalam kalangan peserta. Secara keseluruhannya, pelaksanaan kursus ini berjaya mencapai objektif utamanya dan memberi impak yang signifikan kepada pembangunan keusahawanan komuniti setempat. Kajian mencadangkan agar kursus seumpama ini diteruskan dengan penambahbaikan dari segi fasiliti, ruang pembelajaran serta pendekatan latihan yang lebih interaktif dan berfokuskan keperluan peserta.
Kata kunci: Keberkesanan kursus; Usahawan MADA; Pembelajaran sepanjang hayat.

1. Pengenalan

Setiap Organisasi yang menganjurkan sesuatu program perlu bersedia dalam pelaksanaan sesuatu program agar keberkesanan pengurusan program dapat menjamin kualiti pelaksanaan kursus. Kecekapan dan teratur semua pengurusan memainkan peranan utama dalam mencapai matlamat kursus dan peserta dapat memperoleh pengalaman pembelajaran yang positif. Terdapat beberapa perkara utama dalam pengurusan program yang perlu diberi perhatian untuk menjamin keberkesanannya, antaranya ialah pengurusan sebelum kursus, interaksi yang positif antara urus setia dan peserta, penerimaan serta pelaksanaan maklum balas, dan penyediaan fasiliti yang selesa semasa kursus. Menurut Noorzihidayah et al. (2020) pengurusan memainkan peranan penting dalam sesebuah organisasi kerana ia menyumbang secara langsung kepada kecemerlangan dan kecekapan operasi keseluruhan. Pengurusan program yang baik dapat meningkatkan keyakinan peserta terhadap keberkesanan kursus dan dapat meningkatkan tumpuan peserta terhadap aktiviti yang dijalankan dan mereka akan lebih cenderung untuk menyertai kursus-kursus seterusnya sekiranya mereka berpuas hati dengan aspek pengurusan sepanjang kursus. Manakala, menurut Rizarina Ekhwan et al. (2020), pelaksanaan kursus pendek dilakukan berdasarkan permintaan masyarakat setempat melalui pelbagai inisiatif promosi dan pameran yang bertujuan menarik penyertaan peserta, terutamanya dari kalangan sekolah, jabatan kerajaan, institusi pengajian tinggi, dan lokasi awam. Selain itu, setiap kursus yang ditawarkan perlu dirancang dengan teliti, merangkumi pemilihan tenaga pengajar yang berkelayakan, penyediaan bahan pengajaran yang mencukupi, taklimat awal yang jelas kepada peserta, serta penggunaan platform pendaftaran yang mudah dan mesra pengguna.

Di peringkat Kolej Komuniti, *Garis Panduan Pelaksanaan Pembelajaran Sepanjang Hayat Kolej Komuniti Edisi 2023* telah diperkenalkan sebagai rujukan rasmi dalam pelaksanaan kursus pendek di seluruh negara. Oleh itu, Unit Pembelajaran Sepanjang Hayat (PSH) di Kolej Komuniti Bandar Darul Aman (KKBDA) perlu memastikan setiap kursus yang ditawarkan dilaksanakan mengikut garis panduan ini, demi menjamin kualiti penyampaian serta memenuhi piawaian institusi. Unit PSH juga perlu sentiasa menjalin hubungan strategik dengan pelbagai jabatan kerajaan dan agensi khususnya di sekitar daerah Kubang Pasu dan Alor Setar. Salah satu rakan kerjasama yang aktif ialah Lembaga Kemajuan Pertanian Muda (MADA) Kedah iaitu agensi badan berkanun yang kerap bekerjasama dalam pelaksanaan kursus keusahawanan dan pengurusan perniagaan kepada kumpulan usahawan bimbingan mereka. Sambutan terhadap kursus ini sentiasa menggalakkan, malah setiap tahun terdapat permintaan khusus daripada pihak MADA agar kursus ini diteruskan, memandangkan tenaga pengajar di KKBDA mempunyai kepakaran dan pengalaman dalam bidang keusahawanan, dan pengurusan perniagaan.

Pada tahun 2024, Unit PSH KKBDA telah menyediakan kursus pastri dan pemprosesan makanan buat kali pertama kepada usahawan MADA sebagai satu lagi inisiatif memperluas bidang latihan kemahiran. Namun begitu, bagi kursus pastri dan pemprosesan makanan yang pertama kali ditawarkan kepada usahawan bimbingan MADA, masih belum terdapat sebarang penilaian menyeluruh mengenai keberkesanan pelaksanaannya. Tiada data yang dapat menunjukkan sejauh mana keberkesanan kursus ini kepada usahawan MADA dari sudut perancangan program, pelaksanaan modul, kualiti penyampaian oleh pengajar serta kecekapan pengurusan urus setia. Ketiadaan penilaian yang sistematik akan menyukarkan Unit PSH KKBDA untuk menentukan impak sebenar kursus terhadap peningkatan kemahiran peserta, tahap kebolehpasaran mereka, serta potensi untuk menceburi bidang keusahawanan makanan.

Berdasarkan isu dan permasalahan yang dinyatakan, kajian ini dijalankan bagi membincang dan menganalisis tahap keberkesanan kursus pastri dan pemprosesan makanan yang ditawarkan serta mengenal pasti kekuatan dan kelemahan dalam pelaksanaannya, agar penambahbaikan yang berkesan dapat dilakukan bagi kursus ini pada masa hadapan. Oleh itu, objektif kajian ini adalah menilai keberkesanan perancangan kursus pastri dan pemprosesan makanan dari segi penyampaian kandungan, kesesuaian bahan serta tempoh masa pelaksanaan, menilai kualiti penyampaian pengajar serta keberkesanan pengurusan urusetia dalam menyediakan kemudahan dan sokongan sepanjang kursus serta mengenalpasti tahap keberkesanan pelaksanaan kursus yang telah di ikuti oleh usahawanan bimbingan MADA.

Pembelajaran Sepanjang Hayat (PSH) di institusi TVET merupakan pendekatan utama dalam membangunkan modal insan yang berkualiti dan relevan dengan kehendak pasaran kerja masa kini. Institusi seperti kolej komuniti dan politeknik menyediakan pelbagai kursus pendek dan latihan kemahiran yang membantu individu meningkatkan kemahiran teknikal dan keusahawanan secara berterusan. Menurut kajian oleh Mohd Shahril Fahmi et al. (2023), pelaksanaan program PSH di Politeknik Port Dickson berjaya meningkatkan kemahiran peserta melalui perancangan program yang sistematik dan pengurusan yang cekap. Selain itu, Nor Asfarul et al. (2022) turut menekankan bahawa PSH ini amat signifikan kerana ia memberi kesan positif kepada individu dari pelbagai peringkat umur. Program ini bukan sahaja membantu dalam pengembangan pengetahuan dan kemahiran, malah turut menambah nilai diri seseorang sejajar dengan tuntutan semasa. Keseluruhan dapatan ini membuktikan bahawa pelaksanaan PSH yang terancang memberi impak yang memberangsangkan terhadap pengalaman pembelajaran peserta, di samping meningkatkan motivasi mereka untuk terus menyertai kursus lanjutan. Dalam hal ini, Natasha N.O. et al. (2022) pula menegaskan bahawa kecekapan dan kecemerlangan tenaga pengajar merupakan antara elemen penting yang menyumbang kepada kepuasan peserta serta mampu meningkatkan permintaan terhadap sesuatu kursus yang ditawarkan.

Di samping itu, kerjasama antara agensi kerajaan dengan institusi TVET meningkatkan akses komuniti kepada latihan kemahiran yang relevan dengan keperluan industri dan keusahawanan, sekaligus membantu memajukan ekonomi setempat. Melalui pelaksanaan program PSH di institusi TVET, bukan sahaja keupayaan teknikal individu diperkasa, malah terdapat perkembangan positif dalam aspek daya saing, keyakinan diri, dan mobiliti sosial, khususnya dalam kalangan peserta dari komuniti berpendapatan rendah atau kawasan luar bandar. Ini kerana pendekatan PSH memberikan peluang kedua kepada individu yang tidak berpeluang melanjutkan pelajaran secara formal, tetapi ingin meningkatkan kemahiran atau menceburi bidang keusahawanan. Contohnya, program kursus pendek seperti pemprosesan makanan, penghasilan pastri, serta perniagaan yang ditawarkan oleh kolej komuniti tidak hanya menumpukan kepada aspek teknikal semata-mata, tetapi turut merangkumi elemen pengurusan perniagaan, pemasaran digital, dan penjenamaan produk. Ini membolehkan peserta mengaplikasikan kemahiran tersebut dalam konteks sebenar, seterusnya membuka ruang keusahawanan yang boleh membantu menjana pendapatan dan memajukan ekonomi negara secara holistik. PSH di institusi TVET sebagai platform pembelajaran inklusif yang memberi peluang kepada pelbagai golongan masyarakat untuk mempertingkatkan kemahiran sepanjang hayat.

2. Metodologi

Kajian ini menggunakan reka bentuk kuantitatif berbentuk tinjauan, dimana data dikumpulkan melalui borang soal selidik yang diedarkan dan dijawab oleh responden secara bersemuka selepas pelaksanaan kursus di Kolej Komuniti Bandar Darul Aman (KKBDA). Metodologi ini dapat mengumpulkan data dengan lebih terperinci bagi menilai tahap keberkesanan pelaksanaan kursus pastri dan pemprosesan makanan Lembaga Kemajuan Pertanian Muda (MADA) di KKBDA.

Kajian ini dijalankan dengan menggunakan kaedah persampelan yang terdiri daripada usahawanan bimbingan Lembaga Kemajuan Pertanian Muda (MADA) Kedah yang mengikuti kursus pastri (aneka tart) dan pemprosesan makanan (pes masakan siri 1 dan pes masakan siri 2) pada Ogos 2024. Kursus ini diadakan sebanyak 3 sesi dimana setiap sesi terdiri daripada responden yang berlainan (20 peserta/kursus). Berdasarkan populasi kajian menggunakan jadual Krejcie dan Morgan (1970), sampel yang diperolehi adalah seramai 52 sampel. Jumlah ini melengkapi jumlah minimum sampel sekiranya saiz populasi adalah 60.

Instrumen yang digunakan dalam kajian ini telah diadaptasi daripada kajian yang lepas iaitu instrument Mohd Shahril Fahmi et al. (2023). Soal Selidik ini mengandungi lima bahagian iaitu Bahagian A: Maklumat Demografi, Bahagian B: Keberkesanan Perancangan Program, Bahagian C: Keberkesanan Pelaksanaan Program, Bahagian D: Penilaian pengajar dan Bahagian E: Keberkesanan Pengurusan Urusetia Program. Skala likert 5 mata digunakan seperti ditunjukkan dalam Jadual 1.

Jadual 1. Skala likert 5 mata

Tahap	Skala
Sangat tidak setuju	1
Tidak setuju	2
Tidak pasti	3
Setuju	4
Sangat setuju	5

Data yang telah diperolehi akan dianalisis menggunakan perisian *Statistical Package for Social Sciences* (SPSS) secara deskriptif seperti peratusan, skor min dan sisihan piawai. Bagi mengenalpasti tahan keberkesanan responden Jadual 2 menunjukkan penentuan tahap

keberkesanan skor min yang diadaptasi daripada Mohd Majid (2000), manakala Jadual 3 menunjukkan taksiran skor sisihan piawai (SP) daripada Jas Laile Suzana J. et al (2003).

Jadual 2. Interpretasi skor min

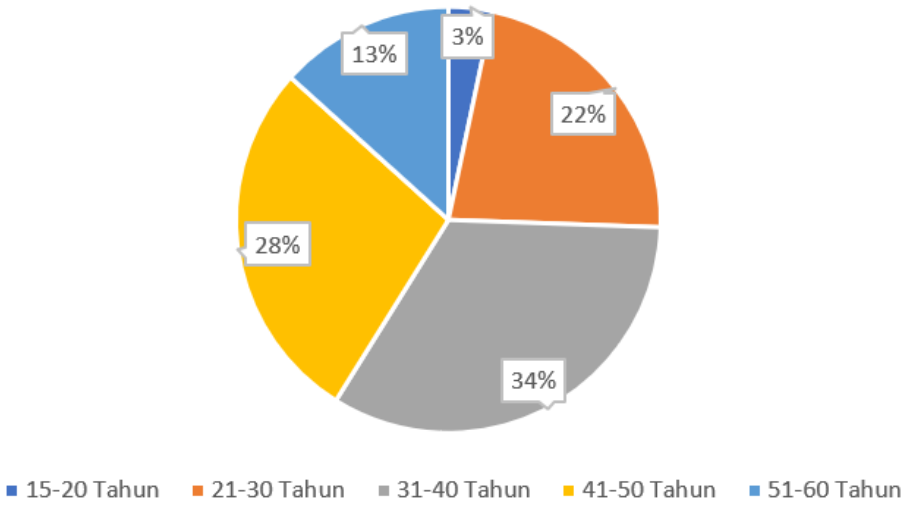
Tahap	Skor min
Rendah	1.00 – 2.33
sederhana	2.34 – 3.66
Tinggi	3.67 – 5.00

Jadual 3: Taksiran Skor Sisihan Piawai (SP)

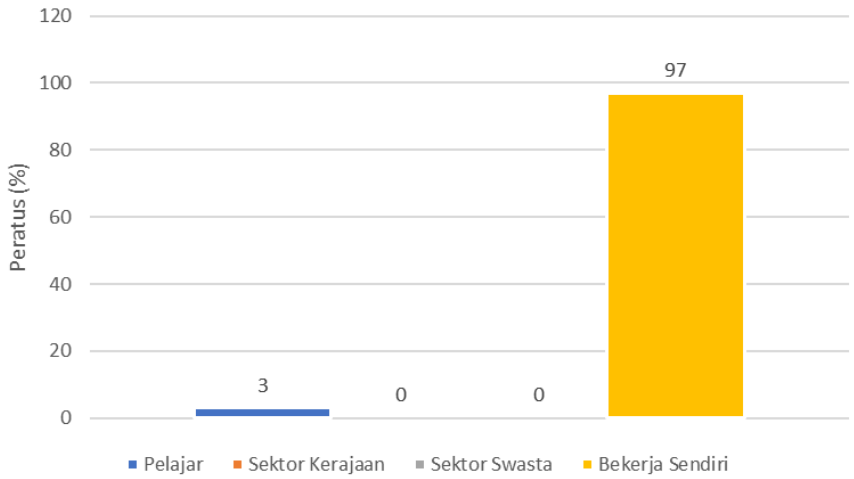
Tafsiran	Skor SP
Konsistensi tinggi (responden memberi jawapan hampir seragam)	0.00 – 0.50
Konsistensi sederhana	0.51 – 1.00
Konsistensi rendah (responden memberi jawapan yang pelbagai)	> 1.00

3. Dapatan dan Perbincangan

Maklumat demografi dalam sampel kajian merangkumi umur dan pekerjaan yang ditunjukkan pada Rajah 1 dan Rajah 2. Dapatan kajian menunjukkan terdapat 3 peringkat umur yang tertinggi peratusan (%) yang mengikuti kursus ini adalah pada peringkat umur 31 hingga 40 tahun (30%, 16 responden), peringkat umur 41 hingga 50 tahun (35%, 18 responden) dan peringkat umur 21 hingga 30 tahun (20%, 10 responden). Selain daripada itu, 2 peringkat umur yang mempunyai peringkat umur yang rendah peratusan adalah pada peringkat umur 51- 60 tahun (12%, 6 responden) dan peringkat umur 15-21 tahun (3%, 2 responden). Ini menunjukkan majoriti peserta adalah dalam lingkungan umur pertengahan dewasa diantara umur 21 tahun hingga 50 tahun yang lazimnya berada dalam fasa kerjaya aktif dan lebih cenderung mengikuti mana-mana kursus bagi tujuan meningkatkan kemahiran dan seterusnya memperkukuh potensi perniagaan yang diceburi serta pendapatan mereka.



Rajah 1. Peratusan responden mengikut umur



Rajah 2. Peratusan responden mengikut pekerjaan

Rajah 2 menunjukkan peratusan (%) pekerjaan peserta kursus, memandangkan peserta kursus adalah usahawan bimbangan MADA wajarlah dapatan kajian bagi maklumat demografi pekerjaan yang tinggi adalah bekerja sendiri (97%, 50 responden) dan yang paling sedikit adalah pelajar (3%, 2 responden) manakala bagi pekerjaan di sektor swasta dan sektor kerjaan tiada peratusan yang dicatakan. Dengan latar belakang sebagai pekerja sendiri, peserta kursus ini dapat memanfaatkan ilmu yang diperoleh untuk meningkatkan kualiti produk mereka, memperluas pasaran, dan memajukan perniagaan secara lebih sistematik. Menurut Noraini et al. (2021) latihan kemahiran dalam bidang pemprosesan makanan secara signifikan membantu meningkatkan daya saing usahawan kecil dan sederhana (PKS). Ini sejajar dengan peratusan usahawan MADA yang bekerja sendiri, di mana mereka memerlukan pengetahuan praktikal untuk memastikan perniagaan mereka mampu bertahan dan berkembang.

Dapatan kajian pada Jadual 4 menunjukkan tafsiran keseluruhan tahap keberkesanan dan konsistensi yang tinggi bagi perancangan program dengan mencatatkan skor min yang tinggi, iaitu dalam skor 4.72 hingga 4.82 dan skor sisihan piawai yang rendah iaitu dalam skor 0.3 – 0.4. Secara keseluruhan, nilai min yang tinggi dan sisihan piawai yang rendah dalam keempat-empat item (B1 hingga B4) yang dianalisis menggambarkan tahap konsistensi yang tinggi dalam maklum balas responden. Ini menunjukkan bahawa kursus yang ditawarkan oleh PSH KKBDA telah memenuhi objektifnya dengan baik dari segi kandungan, penyampaian, kesesuaian bahan, dan tempoh masa pelaksanaan. Menurut Sulaiman dan Hassan (2022), dapatan min tinggi dan SP rendah membuktikan bahawa program yang dirancang dengan baik mampu meningkatkan keyakinan dan kompetensi peserta dan perancangan modul yang tersusun, pendekatan pengajaran yang interaktif, serta kesesuaian bahan latihan memberi kesan langsung terhadap peningkatan pengetahuan dan kemahiran peserta (Noraini et al. 2021).

Item B4 mempunyai nilai min yang paling tinggi (4.82) dan nilai SP yang paling rendah (0.385) menunjukkan tempoh masa kursus yang disediakan amat bersesuai dengan tajuk kursus. Ini menandakan bahawa perancangan masa yang dilakukan oleh penganjur adalah bertepatan dengan keperluan pembelajaran peserta, membolehkan mereka memahami dan menguasai kandungan secara berperingkat tanpa rasa tergesa-gesa atau tertekan. Dalam konteks latihan kemahiran seperti kursus pastri dan pemprosesan makanan, keseimbangan antara teori dan praktikal sangat penting dan berkait rapat dengan keberkesanan masa yang diperuntukkan. Justeru, dapatan ini memperlihatkan bahawa tempoh kursus telah dirancang dengan baik dan selari dengan objektif latihan yang ditetapkan.

Jadual 4. Keberkesanan Perancangan Kursus Pastri Dan Pemprosesan Makanan Lembaga Kemajuan Pertanian Muda (MADA) di Kolej Komuniti Bandar Darul Aman

Item	Penyataan	Min	Sisihan Piawai (SP)	Tafsiran Keseluruhan
B1	Penyampaian Isi Kandungan Mencapai Objektif Kursus.	4.72	0.452	Tahap keberkesanan tinggi dan konsistensi yang tinggi
B2	Kandungan Kursus Yang Disediakan Adalah Relevan Dengan Tajuk Program Dan Teratur.	4.78	0.423	
B3	Bahan dan Peralatan Berkaitan Kursus Disediakan Dengan Cukup Dan Memberi Manfaat.	4.80	0.464	
B4	Tempoh Masa Kursus Yang Disediakan Bersesuaian Dengan Tajuk.	4.82	0.385	

Berdasarkan dapatan kajian pada Jadual 5, keberkesanan pelaksanaan kursus dari segi meningkatkan pengetahuan/kemahiran peserta, mengembangkan laluan kerjaya dan meningkatkan komitmen kepada organisasi mempunyai nilai min yang hampir kepada tahap maksimum, manakala nilai sisihan piawai yang rendah menggambarkan persepsi yang amat positif dan konsisten dalam kalangan peserta terhadap keberkesanan pelaksanaan kursus disampaikan. Item C1 memberikan nilai min yang paling tinggi iaitu 4.87 (SP: 0.362) menunjukkan bahawa majoriti peserta bersetuju bahawa kursus ini telah membantu mereka meningkatkan pengetahuan dan kemahiran dalam bidang yang dipelajari. Menurut Zainuddin et al. (2021) elemen pembelajaran berasaskan pengalaman langsung dan latihan secara praktikal merupakan antara faktor utama yang menyumbang kepada keberkesanan penguasaan kemahiran dalam kalangan peserta. Kajian tersebut melaporkan bahawa peserta yang terlibat dalam latihan praktikal menunjukkan peningkatan signifikan dari segi keyakinan, kemahiran teknikal dan kebolehan untuk mengendalikan perniagaan kecil secara lebih profesional. Oleh itu, pendekatan latihan yang sesuai, praktikal dan memenuhi kehendak peserta adalah sangat penting dalam memastikan keberkesanan pelaksanaan sesebuah program. Manakala item C2 dan C3 masih berada dalam tahap nilai min yang tinggi dan nilai SP yang rendah, menunjukkan bahawa peserta memberikan maklum balas yang konsisten dan positif terhadap aspek pengembangan laluan kerjaya (C2) dan peningkatan komitmen terhadap organisasi (C3). Nilai min yang tinggi ini mencerminkan keyakinan peserta bahawa kursus ini bukan sahaja membantu mereka dari segi kemahiran teknikal, malah turut memberi impak yang signifikan terhadap prospek kerjaya dan motivasi mereka untuk terus berkembang dalam bidang keusahawanan.

Jadual 5. Keberkesanan Pelaksanaan Kursus Pastri Dan Pemprosesan Makanan Lembaga Kemajuan Pertanian Muda (MADA) di Kolej Komuniti Bandar Darul Aman

Item	Penyataan	Min	Sisihan Piawai (SP)	Tafsiran keseluruhan
C1	Saya Dapat Meningkatkan Pengetahuan Selepas Mengikuti Kursus Ini	4.85	0.362	Tahap keberkesanan tinggi dan konsistensi yang tinggi
C2	Saya Dapat Mengembangkan Laluan Kerjaya Di Masa Akan Datang	4.75	0.494	
C3	Saya Dapat Meningkatkan Komitmen Kepada Institusi/Organisasi	4.75	0.494	

Hassan et al. (2021) tenaga pengajar yang berpengalaman dan mempunyai pendekatan pengajaran yang sistematik berupaya meningkatkan kefahaman peserta secara signifikan. Ini telah di buktikan dengan dapatan kajian yang ditunjukkan dalam Jadual 6 iaitu nilai min yang sangat tinggi dan sisihan piawai yang rendah bagi ketiga-tiga item (D1 hingga D3) yang

dinilai. Ini menggambarkan bahawa peserta kursus memberikan maklum balas yang amat positif dan konsisten terhadap peranan pengajar dalam menyampaikan kandungan kursus. Item D3 mempunyai tahap keberkesanan tinggi dan konsistensi yang tinggi dan di ikuti oleh item D2 serta D1. Mutu penyampaian pengajar memainkan peranan penting dalam mempengaruhi tahap pencapaian dan motivasi peserta kursus (Zulkifli dan Rahman, 2022). Kajian tersebut menekankan bahawa kejelasan dalam penyampaian isi kandungan dan penggunaan strategi pengajaran yang pelbagai seperti demonstrasi, perbincangan kumpulan kecil dan bimbingan secara langsung meningkatkan keberkesanan kursus secara menyeluruh. Secara keseluruhan, dapatan ini membuktikan bahawa pengajar memainkan peranan yang sangat penting dalam menentukan kejayaan kursus. Gabungan antara pengetahuan, kaedah penyampaian yang efektif dan kejelasan kandungan telah menyumbang kepada tahap kepuasan yang tinggi dalam kalangan peserta serta memperkukuh keberkesanan keseluruhan program latihan yang dijalankan.

Jadual 6. Penilaian pengajar Kursus Pastri Dan Pemprosesan Makanan Lembaga Kemajuan Pertanian Muda (MADA) di Kolej Komuniti Bandar Darul Aman

Item	Penyataan	Min	Sisihan Piawai (SP)	Tafsiran keseluruhan
D1	Pengajar Yang Berpengetahuan Dalam Bidang Yang Disampaikan	4.82	0.446	Tahap keberkesanan tinggi dan konsistensi yang tinggi
D2	Pengajar Mengajar Dengan Kaedah Dan Mutu Penyampaian Adalah Baik	4.85	0.427	
D3	Tajuk Dan Isi Kandungan Yang Disampaikan Oleh Pengajar Adalah Jelas	4.88	0.335	

Jadual 7 menunjukkan dapatan kajian tahap keberkesanan pengurusan urus setia program dari segi urus setia menguruskan program/kursus yang dirancang dengan teratur, urus setia berinteraksi dengan peserta sangat baik, urus setia sentiasa menerima maklum balas daripada peserta dan penyediaan fasiliti serta kemudahan sepanjang program/kursus adalah baik (Item E1 – E4). Item E4 mencatatkan nilai SP tertinggi dalam kalangan item lain iaitu 0.516, namun masih berada dalam kategori min yang tinggi (4.70). Ini menunjukkan bahawa secara umum, peserta berpuas hati dengan penyediaan kemudahan seperti peralatan, bahan bantu mengajar, dan keperluan asas lain. Namun begitu, sisihan piawai yang sedikit tinggi menunjukkan terdapat variasi pandangan yang mungkin disebabkan oleh perbezaan pengalaman peserta terhadap fasiliti yang disediakan. Dapatan ini selari dengan pandangan Ismail et al. (2022) yang mendapati bahawa pengurusan program latihan yang sistematik dan fasiliti yang lengkap merupakan dua faktor utama yang mempengaruhi tahap kepuasan peserta. Manakala item E1 hingga E3 menunjukkan bahawa peserta sangat berpuas hati dengan aspek pengurusan keseluruhan program. Perancangan yang sistematik termasuk dari segi penyusunan jadual, penyediaan bahan, serta koordinasi aktiviti dapat dilihat sebagai faktor utama yang menyumbang kepada skor min yang tinggi ini. Selain daripada itu, urus setia berjaya mewujudkan hubungan dua hala yang baik, responsif dan mesra dengan peserta. Keberkesanan komunikasi antara urusetia dan peserta memainkan peranan penting dalam memastikan peserta mendapat maklumat yang jelas serta merasa dihargai sepanjang program berlangsung. Nilai min yang tinggi dan SP yang rendah secara konsisten menunjukkan bahawa elemen-elemen sokongan program telah membantu menjayakan pelaksanaan kursus serta memberi pengalaman yang positif kepada peserta.

Jadual 7. Keberkesanan Pengurusan Urusetia Kursus Pastri Dan Pemprosesan Makanan Lembaga Kemajuan Pertanian Muda (MADA) di Kolej Komuniti Bandar Darul Aman

Item	Penyataan	Min	Sisihan Piawai (SP)	Tafsiran keseluruhan
E1	Urusetia Telah Menguruskan Program/Kursus Yang Dirancang Dengan Teratur	4.75	0.439	Tahap keberkesanan tinggi dan konsistensi yang tinggi/sederhana
E2	Urusetia Berinteraksi Dengan Peserta Sangat Baik	4.78	0.423	
E3	Urusetia Sentiasa Menerima Makluman balas Daripada Peserta	4.27	0.405	
E4	Penyediaan Fasiliti Dan Kemudahan Sepanjang Program/Kursus Adalah Baik	4.70	0.516	

4. Kesimpulan

Kajian ini menunjukkan bahawa penilaian tahap keberkesanan pelaksanaan Kursus Pastri dan Pemprosesan Makanan yang dianjurkan oleh Kolej Komuniti Bandar Darul Aman (KKBDA) kepada usahawan bimbingan Lembaga Kemajuan Pertanian Muda (MADA) Kedah telah mencapai objektif pelaksanaannya dengan tahap keberkesanan yang tinggi dalam semua aspek yang dikaji. Perancangan kursus menunjukkan penyampaian isi kandungan yang sistematik, kesesuaian bahan latihan, serta tempoh pelaksanaan yang menepati keperluan peserta. Dari sudut pelaksanaan, kursus ini memberi impak yang signifikan terhadap peningkatan pengetahuan dan kemahiran peserta, di samping membuka peluang untuk perkembangan kerjaya dan peningkatan komitmen dalam bidang keusahawanan makanan. Selain itu, penilaian terhadap pengajar menunjukkan bahawa mutu penyampaian dan pendekatan pengajaran yang digunakan sangat berkesan serta mampu menarik minat peserta. Dari segi pengurusan dan urus setia telah melaksanakan tanggungjawab dengan cekap dan sistematik sepanjang kursus berlangsung, tetapi kekurangan dari aspek penyediaan fasiliti terutama ruang kursus akan diambil maklum untuk kursus-kursus akan datang agar peserta kursus pada mengikuti kursus dengan selesa. Secara keseluruhan, dapatan kajian membuktikan bahawa kursus ini telah memberi pengalaman pembelajaran yang positif kepada peserta dan berpotensi memperkukuh kebolehpasaran serta memperluas peluang keusahawanan mereka. Justeru, adalah dicadangkan agar kursus ini diteruskan dan ditambah baik dari masa ke semasa, khususnya dalam aspek fasiliti fizikal seperti ruang kelas perlu dipertimbangkan, bagi memastikan penyampaian latihan kemahiran yang lebih holistik dan menyeluruh.

LIGHTING MONITORING TRAINER FOR ENERGY PERFORMANCE MEASUREMENT AND VERIFICATION LABORATORY

Amrah Mat Safri*, Nurul Malihah Marzuan

Electrical Engineering Department, Tuanku Sultanah Bahiyah Polytechnic, 09090 Kulim, Kedah, Malaysia

*Corresponding author e-mail address: amrah@ptsb.edu.my

Abstract

The Lighting Monitoring Trainer (LMT) is developed to meet the requirements of the Energy Performance Measurement and Verification laboratory activity at Politeknik Port Dickson. This LMT is used to utilize the Practical Work 1 course for Semester 5 of the Diploma in Electrical Engineering (Energy Efficiency) program. The LMT system comprises both hardware and software components. The hardware includes a power consumption monitoring testbed consisting of three incandescent bulbs and three LED T8 lights. Two dimmer switches are provided to adjust the electricity supplied to each light. Additional components include a power meter, energy sensor, and current sensor. Additionally, the power meter, mounted on the distribution box (DB), displays voltage, current, and power usage when the appliances are operational. For software components, the LMT utilized an Arduino Nano as the primary microcontroller. On the other hand, the interfacing data for the system used PuTTY software on Windows. The real-time data is provided such as voltage, current, power, energy, frequency, and power factor, will be used for analysis. The results show that the 9W LED bulb demonstrated better efficacy (53.1 lumens per watt) compared to a 25W incandescent bulb (5.05 lumens per watt) over 10 seconds. Additionally, the 9W LED bulb consumed less energy (0.05 kWh) compared to the 25W incandescent bulb (0.062 kWh). A 10W LED T8 showed higher efficacy (128.21 lumens per watt) compared to a 9W LED T8 (104.12 lumens per watt) over 10 seconds. For dimmable incandescent bulbs, the 100W bulb produced the highest illuminance (770 lumens per m²) compared to 60W, 40W, and 25W bulbs. In conclusion, LED bulbs show significant efficacy and low energy consumption compared with incandescent bulbs. Moreover, higher-wattage LED T8 lights demonstrate the best and highest energy efficiency.
Keywords: Light Monitoring Trainer (LMT); Efficiency; Power consumption.

1. Introduction

The goal of this innovation is to design and build the Lighting Monitoring Trainer (LMT) for the Energy Performance Measurement and Verification laboratory activity at Politeknik Port Dickson. The LMT was used in the Practical Work 1 course for Option A, the students will work with an Energy Usage Meter to measure and display values such as current, voltage, kWh, frequency, and power factor for various types of light bulbs or tubes. Additionally, the students can download the current, voltage, kWh, frequency, and power factor via USB connection and use PuTTY Software for data recording.

The software is a versatile, open-source, and free SSH client for Windows that allows users to remotely access computers across networks and execute commands as though they were physically sitting at the terminal. This tool is widely utilized in network administration, software development, and various IT-related fields. The software proves especially valuable for accessing and managing Linux servers from a Windows environment. Mastering this tool provides students with the necessary skills to navigate remote servers securely, ensuring a reliable connection every time (W. George, 2023). This trainer is an upgraded version of the older model, which was designed as a direct measure for lighting-focused tasks.

The LMT is used as a teaching aid module to help students understand lighting concepts by utilizing bulbs, dimmers, and LED T8 lights, as an activity outlined in the DEQ50053 Energy Performance Measurement and Verification course syllabus. This innovative trainer is implemented for DEQ students to understand deeper in lighting systems. This innovation is incorporated into the DEQ50053 Energy Performance Measurement and Verification course curriculum for semester 5 students. This was necessary because the previous trainer, the GT-7500 Energy Auditing Technology Panel, was limited to only lighting with bulbs and did not focus on the broader aspects of lighting. The LMT also simplifies the monitoring of energy and power consumption in lighting, enabling students to measure lux, voltage, current, wattage, kWh, frequency, and power factors. Additionally, a video tutorial has been provided to enhance student understanding when performing the practical work.

This innovation stems from the development of a tool designed to enhance students' understanding of lighting systems. It also allows the lecturer to assess the students' practical work and evaluate the CLO2P. This study introduces an innovative tool designed to enhance students' understanding of lighting systems while enabling lecturers to assess students' practical competencies and evaluate the Course Learning Outcome (CLO2P). The primary objective of this research is to develop a lighting monitoring trainer specifically for the DEQ50053 Energy Performance Measurement and Verification course, integrating both hardware and software interfaces. The system is designed to monitor lighting performance through a power meter display and PuTTY software, allowing for real-time data acquisition. Additionally, the study aims to analyze energy efficiency by comparing different types of light bulbs, tubes, and dimmers.

The scope of this research encompasses the practical application of the trainer within the DEQ50053 Energy Performance Measurement and Verification course. The system utilizes PuTTY software to execute scripts from an Arduino Nano microcontroller, which serves as the core processing unit for reading input signals and generating output data. Various lighting sources, including different types of bulbs and dimmers, are incorporated to evaluate their energy consumption and efficiency. The trainer is capable of measuring and displaying key electrical parameters such as current, voltage, power, energy consumption (kWh), frequency, and power factor. Furthermore, in alignment with sustainability initiatives, the hardware structure is constructed using repurposed wooden panels, reinforcing environmental consciousness in educational practices. This innovation not only enhances students' technical proficiency but also promotes hands-on learning experiences that align with Industry 4.0 educational standards.

The paper titled "Automated Lighting Control System in Building," conducted by Srishti Singh and Neeta Mishra from Amity University, Raipur, India, in 2024, offers a comprehensive analysis of the features, benefits, and potential designs of these systems. The paper examines the integration of modern technologies, including daylight harvesting, motion sensors, and occupancy sensors. It categorizes different types of automated lighting control systems and examines their implementation strategies, focusing on best practices for effective deployment across various building contexts.

The research also explores hybrid approaches that combine elements of both decentralized and centralized systems. A key focus of the study is the exploration of new advancements in automated lighting control technologies, such as the increasing use of wireless connectivity, machine learning algorithms for predictive control, and integration with other building management systems. It also investigates the potential impact of these emerging technologies on future building environments.

In conclusion, automated lighting control systems represent a significant leap forward in building management, combining efficiency, flexibility, and sustainability. For optimal

performance, these systems require the strategic integration of sensors, control interfaces, and communication networks to adjust lighting based on occupancy, natural light, and preset schedules. This integration not only boosts energy efficiency but also reduces costs and minimizes negative environmental impacts. The systems offer multiple benefits, including enhanced occupant productivity and comfort, substantial energy and cost savings, and reduced maintenance through efficient lighting usage.

Additionally, the remote-control functionality enhances security and safety, providing valuable advantages for building managers and users. Automated lighting control systems play a critical role in promoting energy efficiency and supporting a sustainable future as buildings adapt to modern needs.

2. Methodology

The system comprises both hardware and software components. The hardware includes a power consumption monitoring test-bed consisting of three incandescent bulbs and three LED T8 lights. Two dimmer switches are provided to adjust the electricity supplied to each light. Additional components include a power meter, energy sensor, and current sensor. The power meter, mounted on the distribution box (DB), displays voltage, current, and power usage when the appliances are operational. For software parts, the LMT employs an Arduino Nano as its microcontroller. For interfacing, the system uses PuTTY software on Windows, providing real-time outputs such as voltage, current, power, energy, frequency, and power factor for analysis.

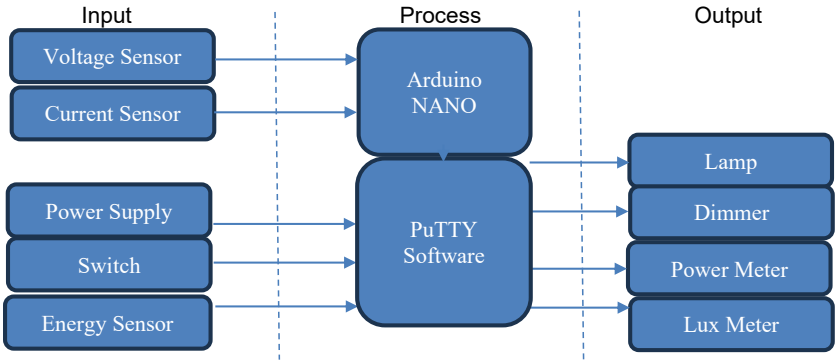

Fig. 1. Block diagram of Lighting Monitoring Trainer (LMT)

This project aims to design and develop a Lighting Monitoring Trainer for the course DEQ50053 Energy Performance Measurement and Verification. The primary goal is to create an integrated system that allows students to monitor and analyze the energy performance of different lighting setups by utilizing both hardware and software components. The system interfaces with an Arduino Nano to read sensor inputs and output real-time data related to energy consumption and performance. Additionally, the project incorporates the PuTTY software to execute scripts and control the hardware, making it a user-friendly platform for educational purposes.

Fig. 2 illustrates the flowchart of LMT for both software and hardware components. The Arduino Nano is a microcontroller that serves as the brain of the construction (Risi et al., 2025). The flowchart presented in Fig. 2 illustrates the operational workflow of an integrated hardware-software system designed for data acquisition and monitoring. The process is divided into two main sections: software and hardware, each following a structured sequence to ensure synchronized data collection.

On the software side, the process begins by connecting a USB interface to a computer or laptop, followed by launching the PuTTY software, which facilitates serial communication

with the hardware components. If PuTTY is successfully executed, the system proceeds with data collection, which is underway; the system continues to monitor until the devices are turned off, marking the end of the operation.

The hardware section operates concurrently, beginning with the activation of a switch that controls a lamp or dimmer. Once the illumination component is successfully powered, the power meter initiates data collection, synchronizing with the software's monitoring process. This interaction between the hardware and software components ensures seamless real-time data acquisition, likely for electrical parameter analysis or performance evaluation. This structured approach underscores the importance of integrating hardware-based sensing with software-driven data acquisition for efficient monitoring systems. The flowchart provides a systematic representation of the process, which could be applicable in various fields, including electrical engineering, embedded system development, and smart energy monitoring.

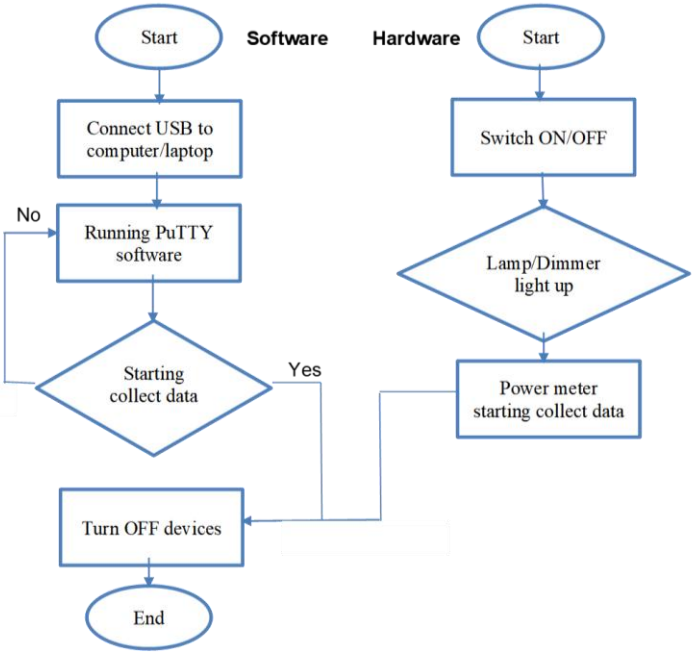

Fig. 2. Flowchart for Lighting Monitoring Trainer (LMT)

Fig. 3 illustrates the schematic diagram of an electrical control and monitoring system that integrates an Arduino microcontroller alongside Putty software for real-time data acquisition and system control. The circuit comprises several key components, including three push buttons (B1, B2, and B3), which serve as user inputs, and three potentiometers (P1, P2, and P3), which provide adjustable resistance to regulate various operational parameters. Additionally, three switches (S4, S5, and S6) facilitate further manual control of the system. The circuit also incorporates three light-emitting diodes (L1, L2, and L3) as visual indicators to represent different operational states. Furthermore, the inclusion of sensors (S1, S2, and S3) suggests that the system is designed for parameter monitoring, potentially measuring voltage, current, or environmental conditions. A dedicated current sensor (I) is integrated to provide real-time current measurement, thereby enhancing the system's monitoring capabilities. The power supply is denoted by "W" and "V," where "V" represents the voltage input to the circuit. This system architecture underscores its potential applicability in educational and research environments, where it can serve as a platform for studying sensor-based monitoring, control mechanisms, and microcontroller-based automation.

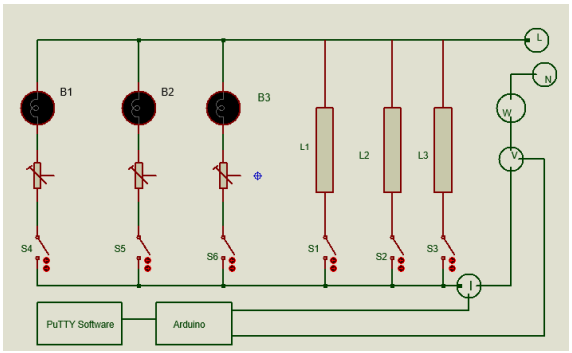

Fig. 3. Circuit using Proteus 8 professional

Three bulbs and three LED T8 lights make up the power consumption monitoring system. The setting of the experiment allows for the measurement of power consumption for each bulb or LED T8 tube, or the combination of all. Fig. 4 shows the position of the two types of appliances on the LMT.

Fig. 4. Lighting Monitoring Trainer (LMT)

The power meter, bulb switch, LED T8 tube switch, energy, and current sensor locations are shown in Fig. 5.

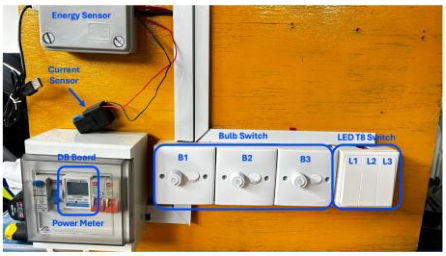

Fig. 5. Switch label

Fig. 6 shows that the power meter on the DB board displays voltage, current, and power usage when the appliance is on.

Fig. 6. Power meter

3. Result and Discussion

The LMT displays data for lamps concerning current, voltage, power, power factor, frequency, and energy consumption. An experiment is performed using different lamps and a duration of 10 seconds. The LMT outputs the data via PuTTY software. Table 1 provides a comparative analysis of various lighting technologies, including incandescent and LED lamps, based on key electrical and optical performance metrics. The table is divided into measured parameters and calculated efficacy values to assess each lamp type's efficiency. The measured parameters include luminous output (in lumens), illuminance (in lux), current (in Amperes), voltage (in volts), power consumption (in watts), power factor, frequency (in hertz), and power energy (in kilowatt-hours) over a 10-second interval. The incandescent bulb (25-Watt) produces a relatively low luminous output of 150 lumens, with a power consumption of 29.7W, yielding an efficacy of 5.05 lumens per watt (lm/W). This low efficacy highlights the inefficiency of incandescent lighting due to significant energy dissipation in the form of heat.

Conversely, LED-based lighting technologies are much more efficient. The 9-Watt LED produces 600 lumens with a power draw of 11.3W, reaching an efficacy of 53.10 lm/W, which is over ten times more efficient than an incandescent bulb. The 9-Watt LED T8 and 10-Watt LED T8 are even more energy-efficient, generating 1000 lumens each with power consumptions of 9.6W and 7.8W, respectively. Their efficacies of 104.12 lm/W and 128.21 lm/W show better luminous efficiency compared to both ordinary LED bulbs and incandescent.

In addition, power factor values reveal each lamp's electrical performance. The incandescent bulb has a relatively high-power factor (0.84), indicating efficient power use. In contrast, the LED lamps have lower power factor values (from 0.19 to 0.37), which points to reactive power components in their circuits, caused by built-in drivers and electronic control systems.

From an energy use perspective, measurements of power consumption in kilowatt-hours (kWh) show that LED lamps use significantly less energy than incandescent bulbs. This higher efficiency, along with its greater luminous efficacy, makes LED lighting a more energy-efficient choice. In summary, the comparison highlights the advantages of LED technology over incandescent lighting in terms of energy efficiency, power use, and luminous output. The results support the use of LED lighting for sustainable and energy-efficient applications, helping reduce electricity use and environmental impact.

Table 1. Analysis of bulb and lamp

Lamp	Lumen	Lux	Current	Voltage	Power	Power factor	Frequency	Power Energy	Efficacy
25 W Incandescent	150	138	0.14	246	29.7	0.84	50	0.062	5.05
9 W LED	600	970	0.26	245	11.3	0.19	50	0.05	53.10
9 W LED T8	1000	540	0.11	245.5	9.6	0.37	50	0.064	104.12
10 W LED T8	1000	604	0.10	246	7.8	0.32	50	0.064	128.21

Based on the results, it is evident that LED bulbs offer better efficacy with lower power consumption compared to incandescent bulbs. 10W LED T8 gives more efficacy than 9W LED T8. This is because the value of power for the 10W LED T8 is smaller than that of the 9W LED T8. Table 2 presents an empirical analysis of the luminous intensity of incandescent bulbs under varying dimmer power settings and actuator percentages. The table evaluates the relationship between dimmer power (W) and the corresponding illuminance (LUX in lumens/m²) over a 10-second interval, considering different actuator levels (0%, 25%, 50%, 75%, and 100%). This assessment is crucial for understanding the dimming behaviour and efficiency of incandescent lighting in variable power conditions.

The results indicate a direct correlation between the dimmer power setting and illuminance levels. At 100W, the luminous intensity ranges from 46 LUX at 0% actuator to 770 LUX at full activation (100%), demonstrating a significant increase in brightness as the dimmer setting progresses. Similarly, for 60W, the illuminance follows an increasing trend, reaching 460 LUX at full actuation. Lower wattage settings, such as 40W and 25W, exhibit lower maximum luminous intensities of 279 LUX and 138 LUX, respectively. Interestingly, at 0% actuator, the illuminance values do not drop to absolute zero but retain residual brightness (ranging from 46 LUX to 65 LUX) due to the nature of incandescent bulbs, which may retain some filament glow even at minimal power. Additionally, the rate of increase in illuminance with respect to actuator percentage varies across different power levels, indicating nonlinear dimming characteristics.
This analysis highlights that higher-wattage incandescent bulbs exhibit greater luminous efficiency under dimming conditions but also consume more power. The nonlinear dimming response suggests potential inefficiencies in traditional dimmer circuits for incandescent bulbs, reinforcing the need for advanced lighting technologies such as LEDs, which provide more efficient and linear dimming characteristics. The findings contribute to research in lighting control systems, energy efficiency in residential and commercial applications, and the development of optimised dimming circuits for incandescent lighting.

Table 2. Analysis of a dimmer using an incandescent bulb

Dimmer (W)	Lux (Lumens/m^2) Actuator (%)				
	0	25	50	75	100
100	46	136	294	564	770
60	46	98	220	379	460
40	53	91	128	198	279
25	65	77	109	128	138

The results show that a 100W incandescent bulb produces a higher lux value than 60W, 40W, and 25W bulbs, with a measurement of 770 lumens per square meter. According to the findings, a 9W LED bulb demonstrated better efficacy, at 53.1 lumens per watt, compared to a 25W incandescent bulb, which provides only 5.05 lumens per watt, over a 10-second period. Additionally, the 9W LED bulb used less energy 0.05 kWh compared to the 25W incandescent bulb, which consumed 0.062 kWh. This clearly demonstrates that LED bulbs are more energy-efficient than incandescent bulbs.

Additionally, a 10W LED T8 exhibited higher efficacy (128.21 lumens per watt) than a 9W LED

T8 (104.12 lumens per watt) during the same 10-second interval. For dimmable incandescent bulbs, the 100W bulb provided the highest illuminance (770 lumens per m²) compared to 60W, 40W, and 25W bulbs. Overall, the results indicate that LED bulbs deliver better efficacy and consume less energy than incandescent bulbs. Furthermore, higher-wattage LED T8 lights show even greater efficacy and energy efficiency.

4. Conclusion

An innovative approach integrating computational simulation using PuTTY software with hands-on experimentation has been introduced in the DEQ50053 Energy Performance Measurement and Verification laboratory course at Politeknik Port Dickson. This innovation is highly recommended for implementation across higher education institutions in Malaysia to align with Industry 4.0 (IR 4.0) educational standards. The training system incorporates advanced safety features, including an additional miniature circuit breaker (MCB) for fault isolation, a non-conductive frame, and an industry-grade power supply. Additionally, it incorporates environmental sustainability by repurposing discarded wood panels for the frame. This approach ensures active student engagement in the learning process while enhancing both safety and environmental responsibility.

CHALLENGES FACED BY SEMESTER 1 STUDENTS IN ANSWERING ESSAY QUESTIONS ON CIRCUIT ANALYSIS TOPICS IN THE DET10103 ELECTRICAL CIRCUIT 1 COURSE

Laila Rosemaizura Yaakop*, Hasnina Haji Abd Rahman

Electrical Engineering Department, Politeknik Sultan Azlan Shah, 35950 Behrang Stesen, Perak, Malaysia

*Corresponding author e-mail address: lailarosemaizura@psas.edu.my

Abstract

This study examines the challenges faced by Semester 1 diploma students in answering essay-based questions on circuit analysis topics in the DET10103 Electrical Circuit 1 course. Despite covering fundamental concepts such as Kirchhoff's Laws, Thevenin's and Norton's Theorems, and mesh and nodal analysis, over 60% of students scored below average in the essay sections of the final exam. Using a mixed-methods approach, including exam script analysis, student surveys, and instructor interviews. The study identifies common issues, including misapplication of laws, skipped problem-solving steps, and poor conceptual understanding. Contributing factors include weak mathematical foundations, limited exposure to analytical thinking, and passive learning habits. To address these gaps, the paper recommends integrating writing-based exercises, visual aids like flowcharts, interactive learning tools, and additional math support sessions. As a future initiative, the development of an interactive eBook focusing on Thevenin's, Norton's, and Kirchhoff's laws with guided exercises and immediate feedback is proposed. This digital resource aims to enhance self-paced learning and strengthen students' analytical writing skills. The findings emphasise the need for pedagogical innovation to improve students' ability to solve and communicate complex circuit analysis problems effectively.
Keywords: Circuit analysis; Essay-based assessment; Engineering education.

1. Introduction

Circuit analysis is a fundamental topic in electrical engineering education, laying the groundwork for more advanced courses in electrical and power systems. The DET10103 Electrical Circuit 1 course, offered to first-semester diploma students, introduces core topics such as Ohm's Law, Kirchhoff's Laws, nodal and mesh analysis. Essay-based assessments serve not only to evaluate students' theoretical comprehension but also their ability to communicate complex information logically and coherently. Despite their importance, students in DET10103 often perform poorly in essay questions, prompting a need to investigate the root causes and develop strategies to address these issues.

Observation and analysis of final exam result over the past two semesters revealed that over 60% of students scored below average in essay-based questions related to circuit analysis. These questions, which require structured analytical thinking and step-by-step problem-solving, appear to be a major challenge for first-semester students. Their inability to solve these questions effectively hampers their overall performance in the course.

First-year electrical engineering students frequently face substantial challenges in grasping the fundamental concepts of circuit analysis. Core techniques such as Kirchhoff's Voltage Law (KVL), Kirchhoff's Current Law (KCL), and nodal analysis are often difficult to master, and these difficulties tend to persist into subsequent courses (Fayyaz & Trueman, 2022). The recurring nature of these issues highlights the need for more effective instructional strategies that can strengthen students' foundational understanding.

Several pedagogical approaches have been proposed to address these learning challenges. Conceptual-based writing exercises, for example, have been found to improve comprehension, particularly among at-risk students. These exercises allow learners to articulate and reflect on key electrical engineering concepts through structured written expression, promoting deeper cognitive engagement (Becker & Hacker, 2022). In another approach, (Niebler, 2023)introduced the use of flowcharts to guide students through network analysis problems. This method provides a structured framework that supports problem-solving and reduces the confusion that students often encounter when tackling complex analytical tasks. Additionally, the use of web-based interactive platforms such as the STACK system has shown positive outcomes. These platforms enable students to practice circuit problems independently and receive immediate feedback, thereby reinforcing learning outside traditional classroom settings (Ellonen et al., 2022).

Broader studies on engineering education further confirm that students commonly struggle with foundational knowledge, mathematical reasoning, and systematic problem-solving skills in circuit analysis courses (Vesapuisto et al., 2022; Nelavai & Ramesh, 2020). In response, many universities have implemented support mechanisms, including foundation courses, personalised problem-solving sessions, and interactive learning environments. The shift to open and distance learning (ODL) during the COVID-19 pandemic introduced additional barriers, such as limited internet access and challenges in comprehending technical content remotely (Abdul Rahman et al., 2022). Despite these obstacles, asynchronous teaching approaches and the deployment of electronic toolkits helped mitigate some of the negative effects. Students reported improved understanding of course content and expressed general satisfaction with the ODL experience by the end of the semester (Abdul Rahman et al., 2022) In parallel, academic writing difficulties present another critical area of concern, particularly among engineering students who must explain complex technical concepts clearly and coherently. Moreover, misconceptions about fundamental concepts, such as those related to direct current (DC) circuits, can impede students' ability to communicate their understanding accurately in written form (Khwanda & Kriek, 2020). These issues have been observed across different educational levels and cultural contexts.

Taken together, these studies underscore the necessity of targeted interventions that support both conceptual understanding and communication skills. Strategies such as writing-to-learn exercises (Becker & Hacker, 2022), visual problem-solving tools (Niebler, 2023), adaptive learning platforms (Ellonen et al., 2022), and enhanced writing instruction (Sa'adan et al., 2024) can play a vital role in improving educational outcomes.

2. Methodology

This study employed a mixed-method design combining quantitative and qualitative approaches to investigate the challenges faced by Semester 1 diploma students in answering essay questions related to circuit analysis topics in the DET10103 Electrical Circuit 1 course at Sultan Azlan Shah Polytechnic. The Participants consisted of 292 students in semester 1 enrolled in the DET10103 course across two academic sessions: Session 1 2024/2025 and Session 2 2024/2025. These students were drawn from various diploma programs, including Diploma in Electrical Engineering (DET), Diploma in Electronic Engineering (Computer) (DTK) and Diploma in Electronic Engineering (Communication) (DEP) and carry-forward students in Session 2. A total of 3 lecturers teaching the course were also involved to provide qualitative insights.

The research was conducted in three phases:

1. Exam Script Analysis: 292 final exam scripts from two sessions were analysed based on content accuracy, logic structure, and completion of analytical steps. Final examination answer scripts from both sessions were reviewed to collect data on essay-based question

performance. Students' scores on the 20-mark essay section were recorded and categorised as either above average (≥10 marks) or below average (<10 marks).
2. Instructor Interviews: Semi-structured interviews were conducted with three experienced Electrical Circuit lecturers. The interviews explored instructors' perspectives on students' comprehension, instructional strategies used, and common mistakes observed during assessment marking.
3. Student Surveys: A questionnaire explored students' perspectives on conceptual understanding, anxiety levels, and learning behaviours. A structured questionnaire was distributed to the students involved. The survey consisted of both Likert-scale and open-ended items aimed at identifying students' learning strategies, conceptual understanding, cognitive challenges, and perceptions of difficulty regarding essay-based circuit analysis questions.

For the quantitative phase, frequency and percentage distributions were calculated to compare student performance in essay questions across two sessions. Data were stratified by program and score category (≥10 or <10). Cross-session trends were analysed to identify performance changes. Qualitative data from open-ended student responses and instructor interviews were thematically analysed using inductive coding. Key themes were extracted to triangulate quantitative findings, providing deeper insight into the cognitive and pedagogical barriers that influenced essay question performance.

3. Results and Discussion

3.1 Exam Essay Score Analysis

Analysis of student exam scripts revealed the following key issues:
- Lack of systematic application: Many students failed to apply circuit laws (KVL, KCL) in a structured manner.
- Conceptual errors: Misidentification of series and parallel elements, and incorrect transformations between Thevenin and Norton equivalents, were common.
- Procedural gaps: Students often skipped essential steps in mesh and nodal analysis, indicating a lack of understanding of problem-solving procedures.

These findings confirm earlier research by Fayyaz and Trueman (2022), who reported persistent errors in fundamental circuit analysis tasks due to weak conceptual grounding.

Table 1. Session 1 2024/2025 Essay Marks Distribution

PROGRAMME	SESSION 1 2024/2025 ESSAY MARKS 20/20		
	Number of students' marks >=10	Number of students' marks <10	Total Students
DET1A	11	17	28
DET1B	12	16	28
DET1C	21	9	30
DET1D	11	17	28
DET1E	5	19	24
DET1F	13	14	27
DTK1A	8	12	20
DTK1B	3	14	17
DEP1A	10	6	16
TOTAL	94	124	218

An analysis of student performance in essay-based questions from the final examination of Session 1 2024/2025 was conducted across nine different classes within the DET10103 Electrical Circuit 1 course. The dataset comprised 218 students, with essay questions marked

out of a total of 20 marks. Students were grouped into two categories: those scoring 10 marks or more, and those scoring below 10 marks.

The findings reveal that only 94 students (43.1%) achieved marks of 10 or above, while the majority—124 students (56.9%)—scored below 10 marks. This performance trend was consistent across most classes. For instance, in DET1E, only 5 students (20.8%) achieved scores of 10 or above, compared to 19 students (79.2%) who scored below the threshold. Similarly, DET1A and DET1D both recorded 11 students with satisfactory scores and 17 below-average performers each. Although DET1C stood out with 21 students (70%) achieving scores ≥10, it remained an exception among the groups.

The results reinforce earlier qualitative findings from surveys and interview feedback that highlighted common student difficulties, including misapplication of Kirchhoff's and Ohm's Laws, skipping procedural steps in mesh and nodal analysis, and confusion when converting between Thevenin and Norton equivalents. The data also aligns with the notion that students struggle more with higher-order cognitive tasks, such as organising structured analytical responses and justifying problem-solving steps, skills commonly assessed through essay-based formats.

The prevalence of low essay scores suggests a gap in conceptual understanding and procedural fluency, particularly among first-semester students. This may be attributed to several factors identified in earlier sections of this study, such as inadequate preparation from secondary education, passive learning behaviour, and weak mathematical foundations. Furthermore, the underperformance in essay-based questions implies that students may not be receiving sufficient guided practice in structuring and articulating technical reasoning in written form.

These findings highlight an urgent need for pedagogical strategies that emphasise conceptual clarity and writing-based problem-solving. Future interventions may include the implementation of guided writing exercises, scaffolded assignments, and the development of interactive digital tools such as eBooks with step-by-step tutorials to better support students in mastering both the theory and communication of circuit analysis.

Table 2. Session 2 2024/2025 essay marks distribution

PROGRAMME	SESSION 2 2024/2025 ESSAY MARKS 20/20		
	Number of students marks >=10	Number of students marks <10	Total Students
DET1A	0	21	21
DET1B	8	15	23
DTK1A	1	8	9
CARRY	1	20	21
TOTAL	10	64	74

The analysis of Session 2 2024/2025 results demonstrates a further decline in student performance on essay-based questions in the DET10103 Electrical Circuit 1 course. Out of a total of 74 students evaluated, only 10 students (13.5%) scored 10 marks or above, while a significant 64 students (86.5%) scored below 10 marks out of 20. This marks a notable decrease in performance compared to Session 1, where 43.1% of students achieved scores ≥10.

Performance across all groups shows a concerning trend. In DET1A, no students achieved 10 or more marks, with all 21 students (100%) scoring below 10. DET1B performed slightly better, with 8 out of 23 students (34.8%) meeting the threshold. However, DTK1A recorded

only 1 out of 9 students (11.1%) scoring satisfactorily, and the CARRY group showed particularly poor results, with only 1 out of 21 students (4.8%) passing the 10-mark threshold. These results reflect a significant drop in essay performance and reinforce the concerns raised in the previous session regarding students' inability to demonstrate structured analytical thinking, particularly when applying Kirchhoff's Laws, mesh/nodal analysis, and Thevenin/Norton equivalents. The sharp increase in low scores suggests not only persistent conceptual and procedural difficulties but also a potential lack of instructional reinforcement or intervention following Session 1's findings.

This downward trend signals an urgent need to re-evaluate existing instructional strategies, assessment preparation, and student support mechanisms. The high failure rate in the essay component indicates that students continue to struggle with communicating problem-solving steps and justifying analytical reasoning in written form. Without targeted pedagogical innovation such as interactive resources, structured writing exercises, and diagnostic formative assessments, students may continue to underperform in these critical areas of electrical engineering education.

A comparative analysis of student essay performance in the DET10103 Electrical Circuit 1 course over two consecutive sessions reveals a declining trend in analytical writing competency. In Session 1 2024/2025, out of 218 students, 94 students (43.1%) achieved satisfactory scores (≥10 out of 20) in essay-based questions, while 124 students (56.9%) scored below the benchmark. Conversely, in Session 2 2024/2025, only 10 out of 74 students (13.5%) met the satisfactory mark, with 64 students (86.5%) scoring below 10.

The overall drop in the percentage of students achieving satisfactory marks from 43.1% to 13.5% indicates a significant decline in essay performance. Particularly alarming is that certain groups, such as DET1A and the Carry students in Session 2, recorded failure rates of 100% and 95.2%, respectively. These findings suggest that students continue to face substantial difficulties in articulating analytical reasoning in written form, especially when solving problems involving Kirchhoff's Laws, mesh/nodal analysis, and Thevenin/Norton theorems.

The worsening performance trend underscores the urgency for pedagogical reform. It supports the rationale for implementing targeted instructional strategies, such as interactive digital learning tools and structured writing support, to address conceptual gaps and improve students' ability to solve and communicate complex circuit problems effectively.

The data support existing literature suggesting that students often fail to demonstrate adequate understanding of circuit analysis concepts (Fayyaz & Trueman, 2022). Several contributing factors may explain the poor outcomes, including a weak mathematical background, a lack of structured analytical training, and cognitive overload during problem-solving.

Students appeared to struggle with the multi-step nature of essay-based assessments, where demonstrating reasoning and articulating the application of laws such as Kirchhoff's or Thevenin's Theorem is essential. This is consistent with findings by Becker and Hacker (2022), who identified the lack of writing practice as a major barrier to conceptual learning.

3.2 Survey and Interview Feedback

The trend suggests that traditional lecture-based and memorisation-focused teaching methods may not effectively support learning in technically complex areas. Visual learning tools, procedural flowcharts (Niebler, 2023) and interactive platforms (Ellonen et al., 2022) offer promising alternatives. These tools allow students to practice applying theoretical knowledge in a structured, guided manner and can help alleviate performance gaps over time.

Survey results and instructor interviews revealed several trends:

- Conceptual Difficulty: 75% of students admitted difficulty in understanding concepts, even though they could often memorise formulas.
- Cognitive Anxiety: Students reported high stress levels when facing multi-step essay questions, often unsure how to begin or structure their responses.
- Passive Learning Behaviour: Lecturers noted that students were passive during tutorials and reluctant to engage in open-ended problem-solving tasks. Many depended heavily on rote memorisation and example repetition. Many students relied heavily on memorisation and were hesitant to engage in open-ended tasks.
- Lack of Procedural Knowledge: Steps in nodal or mesh analysis were often skipped or misapplied.

These findings echo the benefits of introducing procedural visual tools (Niebler, 2023) and interactive, feedback-rich environments like STACK (Ellonen et al., 2022)

3.3 Root Causes

Given that 60% to 86% of students scored poorly, this study strongly recommends the integration of conceptual-based writing tasks, step-by-step visual aids, and interactive e-learning modules tailored to circuit analysis. Providing targeted math support and embedding writing exercises within technical courses could enhance analytical writing and critical thinking—two essential skills for engineering problem-solving.

From the triangulated data, several underlying causes were identified:

Inadequate exposure to analytical thinking: Many students lacked training in logical reasoning and step-by-step analysis, skills often underdeveloped in secondary education.

Weak mathematical foundation: Difficulty with algebra and linear equations hindered their ability to manipulate and solve circuit equations.

Lack of practice: Students reported minimal exposure to application-oriented exercises, particularly those requiring explanation and justification of answers.

These root issues echo those identified by Vesapuisto et al. (2022) and Nelavai & Ramesh (2020), who emphasized the importance of pre-university preparation and foundational skill development in STEM fields.

4. Conclusion

This study confirms that a majority of Semester 1 students face significant challenges in answering essay questions related to circuit analysis. Misapplication of key laws, missing steps in problem-solving, and writing difficulties are compounded by weak mathematical foundations and passive learning approaches.

Based on the findings, the following interventions are recommended:

1. Integration of Writing-Based Exercises: Incorporating structured writing assignments can encourage students to articulate their reasoning processes, improving both conceptual clarity and communication skills.
2. eBook Use of Visual Aids and Flowcharts: Guiding students through problem-solving with step-by-step visual tools can enhance procedural understanding and reduce cognitive overload.
3. Interactive Learning Platforms: Adoption of digital tools like STACK or Moodle-based quiz systems can offer students immediate feedback and additional practice outside of class.
4. Math Support Sessions: Supplemental tutorials focused on mathematical techniques relevant to circuit analysis can address foundational weaknesses.

5. Active Learning Strategies: Group problem-solving, peer teaching, and flipped classroom models can foster deeper engagement and collaborative reasoning.

As a future direction, this paper proposes the development of an interactive eBook covering Thevenin, Norton, and Kirchhoff's laws, embedded with guided examples and instant feedback. Such tools can support students in self-paced mastery and are aligned with the digital transformation of engineering education.

Abstrak

Kajian ini bertujuan untuk meneliti persepsi pelajar Kolej Komuniti Ledang terhadap penggunaan media sosial sebagai platform untuk memasarkan perniagaan mereka. Media sosial kini menjadi alat penting dalam era digital yang membolehkan perniagaan mengembangkan jangkauan pasaran serta membina hubungan pelanggan dengan lebih berkesan. Kajian ini menggunakan pendekatan kuantitatif dengan melibatkan 73 orang pelajar sebagai responden. Instrumen kajian adalah soal selidik berskala Likert 5 yang dibina sendiri dan telah disemak oleh pakar bagi memastikan kesahihan kandungan dan kebolehpercayaan. Analisis deskriptif digunakan untuk menilai taburan persepsi pelajar, termasuk aspek demografi dan objektif kajian. Nilai skor min dianalisis untuk menentukan tahap persepsi terhadap keberkesanan media sosial sebagai alat pemasaran. Hasil kajian menunjukkan bahawa secara keseluruhan, pelajar berada pada tahap persepsi sederhana dengan nilai skor min keseluruhan sebanyak 3.6. Ini menunjukkan bahawa walaupun pelajar menyedari potensi media sosial sebagai platform pemasaran, penggunaannya masih belum dimaksimumkan. Kajian ini memberi sumbangan penting dalam mengenal pasti keperluan latihan pemasaran digital dalam kalangan pelajar serta mencadangkan pelaksanaan intervensi yang lebih berstruktur seperti bengkel keusahawanan dan latihan pemasaran digital. Usaha ini selaras dengan agenda pembangunan Pendidikan Teknikal dan Latihan Vokasional (TVET) negara yang bertujuan memupuk semangat keusahawanan dan meningkatkan literasi digital dalam kalangan pelajar institusi pendidikan.
Kata kunci: Persepsi pelajar; Media sosial; Pemasaran perniagaan.

1. Pengenalan

Dalam era digital yang berkembang pesat, media sosial telah menjadi salah satu saluran utama dalam strategi pemasaran moden. Ia membolehkan perniagaan menjangkau khalayak yang lebih luas, termasuk pasaran antarabangsa, serta memupuk interaksi dua hala dengan pengguna secara masa nyata (Infante & Mardikaningsih, 2022; Rueda & Moralista, 2023). Ciri-ciri seperti kos rendah, kelajuan penyebaran maklumat dan keupayaan mencipta kesetiaan jenama menjadikan media sosial satu alat penting dalam mempengaruhi keputusan pembelian pelanggan (Puspaningrum, 2020; Suariedewi, 2023). Tambahan pula, kandungan yang menarik dan interaktif berupaya meningkatkan kesedaran dan imej jenama dalam kalangan pengguna (Majesta & Aruan, 2020).

Platform seperti Facebook, Instagram dan TikTok kini diiktiraf sebagai medium yang strategik untuk promosi dan pemasaran, bukan sahaja oleh syarikat besar malah juga oleh usahawan kecil dan individu (Tajpour et al., 2024). Potensi besar ini turut mendorong banyak institusi pendidikan memperkenalkan elemen pemasaran digital dalam aktiviti keusahawanan pelajar. Namun begitu, pemerhatian awal mendapati bahawa penggunaan media sosial secara strategik dalam kalangan pelajar Kolej Komuniti masih belum dimaksimumkan. Ramai pelajar

menggunakan media sosial untuk tujuan hiburan semata-mata, tanpa menyedari fungsinya sebagai alat pemasaran yang efektif. Kekurangan pendedahan, kemahiran teknikal dan panduan sistematik mungkin menjadi antara faktor penyumbang kepada perkara ini. Sehubungan itu, pelbagai aktiviti yang mengintegrasikan elemen pemasaran digital dalam keusahawanan pelajar telah dilaksanakan di kampus bagi membina kesedaran dan kemahiran yang relevan.

Kajian ini dijalankan bagi meneliti persepsi pelajar Kolej Komuniti Ledang terhadap penggunaan media sosial sebagai platform pemasaran perniagaan. Pemerhatian awal mendapati bahawa pelajar masih menggunakan media sosial lebih kepada hiburan berbanding sebagai alat pemasaran strategik. Oleh itu, objektif kajian ini adalah untuk menilai tahap persepsi pelajar terhadap keberkesanan media sosial, tahap penggunaannya, serta faktor yang mempengaruhi keberkesanan tersebut dalam konteks keusahawanan pelajar. Objektif ini dikaitkan secara langsung dengan isu kekurangan pendedahan dan kemahiran strategik dalam pemasaran digital yang dibincangkan dalam pernyataan masalah.

Pemasaran melalui platform media sosial memainkan peranan penting dalam meningkatkan kesedaran jenama, yang menjadi salah satu faktor utama mempengaruhi keputusan pembelian pengguna. Beberapa kajian telah menunjukkan bahawa aktiviti pemasaran menggunakan media sosial amat berkesan dalam merangsang kesedaran jenama dalam kalangan pengguna berpotensi. Sebagai contoh, Saputra melaporkan bahawa strategi pemasaran media sosial boleh mencetuskan minat pengguna yang kemudiannya membawa kepada pembelian. Penemuan ini turut disokong oleh Sugana dan Gunawan, yang melihat bahawa kesedaran jenama menjadi penghubung antara pemasaran media sosial dan keputusan pembelian pengguna (Saputra, 2023; Sugana & Gunawan, 2022). Sementara itu, Jitprapai et al. mendapati bahawa media sosial sesuai digunakan untuk kategori produk yang tidak memerlukan perhatian tinggi, namun masih mampu membina kesedaran jenama secara signifikan (Jitprapai et al., 2021).

Dari sudut lain, kandungan media sosial yang berkualiti juga dapat memperkukuh imej jenama dan mempengaruhi penilaian pengguna. Suariedewi mencatat bahawa interaksi yang konsisten menerusi media sosial dapat membina kepercayaan dan kesetiaan jenama. Penemuan ini selari dengan dapatan Majesta dan Aruan, yang mendapati perniagaan yang menghasilkan kandungan menarik dan relevan berpeluang mewujudkan hubungan yang kukuh antara pengguna dan jenama. Ciri interaktif media sosial pula mendorong kepada pembentukan komuniti pengguna setia serta memperkukuh kepercayaan terhadap jenama (Suariedewi, 2023; Majesta & Aruan, 2020; Cheung et al., 2020).

Kajian oleh Mikhael dan Susan turut menyokong pandangan bahawa pemasaran menerusi media sosial membantu pengguna mengenali produk dengan lebih baik, sekaligus mendorong mereka membuat keputusan pembelian (Mikhael & Susan, 2022). Dalam kajian lain, Fajri et al. merumuskan bahawa pendekatan pemasaran digital ini bukan sahaja membantu meningkatkan kesedaran jenama, tetapi turut menyokong proses membuat keputusan dalam kalangan pengguna (Fajri et al., 2021).

Seterusnya, penggunaan media sosial dilihat mampu menggantikan kaedah pengiklanan tradisional melalui pendekatan yang lebih kos efektif dalam menjangkau khalayak sasaran. Novianti dan Erdiana dalam kajian mereka menjelaskan bahawa media sosial bukan sahaja memudahkan komunikasi dua hala, malah memperkukuh keberkesanan pengiklanan dengan interaksi yang lebih langsung dan menyeluruh (Novianti & Erdiana, 2020). Hujah ini turut diperkuatkan oleh Rahardja, yang melihat platform seperti Facebook, Twitter, dan Instagram sebagai saluran pemasaran yang strategik untuk meningkatkan jualan produk (Rahardja, 2022).

Di samping itu, nilai pengiklanan dalam media sosial juga berkait rapat dengan elemen kredibiliti dan persepsi pengguna. Kajian Ojha membuktikan bahawa elemen seperti hiburan, maklumat dan kepercayaan yang ditampilkan dalam iklan mampu membentuk persepsi positif terhadap jenama (Ojha, 2022). Karunarathne pula menjelaskan bahawa nilai pengiklanan yang tinggi dalam media sosial dipengaruhi oleh pelbagai faktor yang secara langsung menyumbang kepada keberkesanannya (Karunarathne, 2022).

2. Metodologi

Kajian rintis turut dijalankan bagi menilai kefahaman dan konsistensi item dalam soal selidik. Seramai 10 orang pelajar Kolej Komuniti Ledang telah dilibatkan, dan mereka tidak termasuk dalam sampel kajian sebenar. Hasil kajian rintis menunjukkan bahawa semua item difahami dengan jelas tanpa kekeliruan dan tidak memerlukan sebarang pindaan besar.
Kebolehpercayaan instrumen diuji menggunakan pekali Cronbach's Alpha, yang mengukur sejauh mana item-item dalam instrumen berkorelasi dan konsisten. Nilai α yang diperoleh adalah 0.85, menandakan tahap kebolehpercayaan yang tinggi dan sesuai untuk skala penilaian kuantitatif (Edelsbrunner, Simonsmeier, & Schneider, 2025). Ini membuktikan bahawa instrumen soal selidik ini boleh digunakan dengan sah dan tepat dalam kajian sebenar.

Kajian ini menggunakan pendekatan kuantitatif dengan reka bentuk kajian tinjauan. Seramai 73 pelajar daripada pelbagai program di Kolej Komuniti Ledang telah dipilih secara persampelan mudah. Instrumen soal selidik berskala Likert 5 mata ini dibina berdasarkan literatur terdahulu dan disemak oleh pakar. Kajian rintis dijalankan ke atas 10 pelajar bukan sampel kajian bagi menilai kefahaman dan konsistensi item, dengan nilai kebolehpercayaan Cronbach's Alpha direkodkan pada 0.85. Data dianalisis secara deskriptif menggunakan SPSS versi 26, dan skor min ditafsir berdasarkan piawaian oleh Ngadiman et al. (2019): 1.00–1.99 (Lemah), 2.00–2.99 (Rendah), 3.00–3.99 (Sederhana), dan 4.00–5.00 (Tinggi).

Penentuan tahap berdasarkan skor min seperti yang ditunjukkan dalam Jadual 1.

Jadual 1. Tafsiran Skor Min

Skor min	Tafsiran
1.00– 1.99	Lemah
2.00– 2.99	Rendah
3.00– 3.99	Sederhana
4.00– 5.00	Tinggi

(Sumber: Ngadiman et al., 2019)

3. Dapatan dan Perbincangan

Jadual 2 menunjukkan bahawa majoriti responden terdiri daripada pelajar perempuan iaitu sebanyak 72.6% manakala pelajar lelaki mewakili 27.4% daripada keseluruhan sampel. Dari segi semester pengajian, peratusan tertinggi berada di Semester 1 (45.2%), diikuti oleh Semester 3 (34.2%), Semester 2 (13.7%) dan hanya 6.8% daripada pelajar sedang menjalani latihan industri. Dalam konteks program pengajian, lebih separuh daripada responden mengikuti program Sijil Pasti (58.9%) manakala selebihnya mengikuti Sijil Automotif (19.2%), Sijil Pengoperasian Perniagaan (17.8%) dan Sijil Teknologi Penyejukan dan Penyamanan Udara (4.1%).

Bagi tahap penggunaan media sosial, kebanyakan pelajar melaporkan tahap penggunaan yang sederhana (68.5%) manakala 31.5% berada pada tahap tinggi. Tiada responden yang melaporkan tahap penggunaan yang rendah. Dari aspek latar belakang sosioekonomi pula, majoriti responden berasal daripada kategori pendapatan B40 (79.5%) diikuti M40 (12.3%) dan T20 (5.5%). Tiada wakil daripada kategori ELITE. Ini menunjukkan sebahagian besar

pelajar datang daripada keluarga berpendapatan rendah yang mencerminkan realiti sebenar pelajar Kolej Komuniti Ledang.

Jadual 2. Latar Belakang Responden

	Item	n	%
Jantina	Lelaki	20	27.4
	Perempuan	53	72.6
Semester	1.00	33	45.2
	2.00	10	13.7
	3.00	25	34.2
	Latihan Industri	5	6.8
Program Pengajian	Sijil Pengoperasian Perniagaan	13	17.8
	Sijil Pasti	43	58.9
	Sijil Automatif	14	19.2
	Sijil Teknologi Penyejukan dan Penyamanan Udara	3	4.1
Tahap Penggunaan Media Sosial	Rendah	0	0
	Sederhana	50	68.5
	Tinggi	23	31.5
Kategori Pendapatan Ibu Bapa	B40	58	79.5
	M40	9	12.3
	T20	4	5.5
	ELITE	0	0

Corak penggunaan media sosial yang sederhana dalam kalangan pelajar ini selari dengan dapatan kajian Devisakti, Muftahu dan Xiaoling (2023) yang menyatakan bahawa jurang digital masih wujud dalam kalangan pelajar B40 terutamanya dari segi akses peranti, literasi digital dan kestabilan sambungan internet. Kajian mereka juga menunjukkan bahawa golongan ini cenderung menggunakan media sosial lebih kepada tujuan sosial dan hiburan berbanding secara strategik untuk pembelajaran atau keusahawanan. Secara keseluruhannya, data ini memberikan gambaran awal terhadap profil demografi pelajar yang terlibat dalam kajian serta menyokong kepentingan untuk menilai persepsi dan potensi penggunaan media sosial sebagai platform pemasaran dalam kalangan pelajar Kolej Komuniti Ledang.

Jadual 3. Analisis Persepsi Pelajar Terhadap Media Sosial

No.	Item Kajian	Min	Tahap
D1	Media sosial memudahkan saya memasarkan produk atau perkhidmatan kepada pelanggan.	3.74	Sederhana
D2	Saya percaya media sosial adalah platform pemasaran yang lebih efektif berbanding kaedah tradisional.	3.62	Sederhana
D3	Penggunaan media sosial menjimatkan kos pemasaran perniagaan.	3.68	Sederhana
D4	Media sosial membantu saya berinteraksi secara langsung dengan pelanggan.	3.62	Sederhana
D5	Saya mudah mencapai pelanggan yang lebih luas melalui media sosial.	3.56	Sederhana
D6	Media sosial memberikan peluang kepada saya untuk mempelajari strategi pemasaran baharu.	3.77	Sederhana
D7	Saya rasa penggunaan media sosial meningkatkan imej perniagaan saya.	3.66	Sederhana
	Purata min keseluruhan	3.56	

Jadual 3 menunjukkan bahawa tahap persepsi pelajar terhadap penggunaan media sosial sebagai platform pemasaran berada pada tahap sederhana dengan purata min keseluruhan 3.56. Ini mencerminkan bahawa walaupun pelajar menyedari manfaat asas seperti kos rendah

dan capaian pelanggan yang luas, penggunaan secara strategik masih belum dimaksimumkan. Potensi media sosial sebagai alat pemasaran masih belum diterokai sepenuhnya, terutamanya dalam aspek penyampaian kandungan dan pembinaan hubungan jenama. Dapatan ini disokong oleh kajian Diano et al. (2025) yang mendapati korelasi positif kuat antara engagement media sosial dan tingkah laku membeli dalam kalangan pelajar perniagaan. Item D6 mencatat min tertinggi (3.77), menunjukkan pelajar mengakui media sosial sebagai ruang pembelajaran strategi pemasaran baharu. Item D1 (3.74) dan D3 (3.68) pula menunjukkan kefahaman tentang kemudahan dan penjimatan kos yang ditawarkan. Namun, item D5 dan D7, masing-masing mencatat min 3.56, menunjukkan adanya keraguan terhadap keupayaan media sosial dalam memperluas jangkauan dan membina imej perniagaan yang kukuh. Oleh itu, latihan dan intervensi yang lebih tersusun diperlukan bagi memperkasakan penggunaan media sosial secara strategik dalam kalangan pelajar.

4. Kesimpulan

Kajian ini membuktikan bahawa pelajar Kolej Komuniti Ledang mempunyai persepsi yang sederhana terhadap penggunaan media sosial sebagai platform pemasaran perniagaan, dengan nilai skor min keseluruhan sebanyak 3.6. Walaupun pelajar menyedari kelebihan media sosial seperti kos yang rendah, capaian pasaran yang luas, dan kebolehan berinteraksi secara langsung dengan pelanggan, dapatan menunjukkan bahawa penggunaannya secara strategik masih belum dimaksimumkan. Hal ini mencerminkan bahawa potensi sebenar media sosial sebagai alat pemasaran masih belum diterokai sepenuhnya oleh pelajar. Berdasarkan dapatan ini, penulis mencadangkan agar pihak institusi mempergiatkan program latihan dan bengkel berkaitan pemasaran digital yang memberi penekanan kepada strategi kandungan, pengurusan jenama peribadi serta penggunaan platform seperti TikTok dan Instagram secara berkesan. Selain itu, pensyarah perlu memainkan peranan aktif sebagai fasilitator digital dalam membimbing pelajar menyesuaikan strategi pemasaran dengan keperluan industri semasa dan perkembangan teknologi. Pembangunan modul pemasaran digital secara berstruktur juga wajar diperkenalkan dalam kokurikulum keusahawanan di Kolej Komuniti bagi memastikan kemahiran ini dikuasai dengan lebih mendalam. Langkah-langkah ini bukan sahaja mampu meningkatkan tahap kecekapan pelajar dalam bidang pemasaran digital, tetapi juga menyumbang kepada pembangunan literasi digital dan semangat keusahawanan selaras dengan agenda Pendidikan Teknikal dan Latihan Vokasional (TVET) negara. Penemuan ini turut disokong oleh kajian Diano et al. (2025) yang menyatakan bahawa pemasaran media sosial memainkan peranan penting dalam mempengaruhi tingkah laku pengguna dan wajar dikuasai oleh pelajar dalam bidang perniagaan.

Abstract

In the rapidly evolving educational landscape, Technical and Vocational Education and Training (TVET) emerges as a cornerstone for equipping learners with the practical skills required in the modern workforce. The advent of Metaverse, an immersive digital ecosystem incorporating virtual and augmented reality, presents an unparalleled opportunity to revolutionize TVET by seamlessly integrating experiential learning with real-world applications. This study seeks to investigate the dynamics of teacher development within Metaverse-enhanced TVET education by focusing on the mediating role of teacher engagement. The research pursues two primary objectives: first, to explore the relationship between teacher development dimensions (comprising professional development, engagement with Metaverse tools, pedagogical training, and teachers' readiness) and teaching effectiveness in a Metaverse context. Second, it evaluates the mediating mechanism of teacher engagement on the nexus between teacher development dimensions and teaching effectiveness. Anchored in a quantitative research methodology, the study proposed a web-based survey for data collection and PLS-SEM for data analysis. The findings of this study are expected to significantly enrich the academic discourse on TVET education and Metaverse technologies, a domain that remains emerging globally and remarkably underexplored in Malaysia. Furthermore, the finding is expected to bridge existing knowledge gaps, offering fresh insights into how digitalization and sustainable practices can redefine educational strategies in Malaysia's TVET sector.
Keywords: TVET Education; Teacher Engagement; Professional Development.

1. Introduction

Education is considered a crucial catalyst for human intellectual advancement and socio-economic progress, as acknowledged by the United Nations. Consequently, education is recognized as a human right, as outlined in the Universal Declaration of Human Rights (UDHR) and the United Nations Sustainable Development Goals (SDGs) (Boeve-de Pauw and Halbac-Zamfir, 2020). In education, technical and vocational education and training (TVET) are crucial in equipping people with skills to get employed to help boost the economy and also increase social mobility. TVET indirectly contributes to achieving SDG#4 (quality education), SDG#8 (decent work and economic growth), and SDG#9 (industry, innovation, and infrastructure) for the development of the workforce. TVET is fast gaining global recognition, and many countries like Malaysia have enacted policies to boost its performance. In response to the industry demands, the Malaysian government has restructured its TVET system with vocational training, digital transformation, and competency-based education to prepare its graduates for a competitive job market. Despite the enacted policies to boost its performance, the challenges of teacher development within TVET education are still lacking. This includes skills mismatches, teacher competencies, and outdated curricula (Matabane et al., 2022).

TVET lacks adequate support to deliver hands-on training online, as shown during the COVID-19 pandemic in Malaysia (Yeap et al., 2021). This accelerated the trail of digital learning and new-age technology to enhance teaching efficiency. After the pandemic, post-reforms have

aimed to improve digital methods, teachers' competencies, and a standardized system of quality that ensures standardization. TVET education is being transformed by technological advancements such as AI, AR, VR, and big data, making it more engaging and personalized for learning and skill application in a virtual environment (Bakar et al., 2024). The Metaverse is becoming an excellent tool for vocational training, where students may learn without physical limitation in a virtual industrial, medical, or engineering environment. The Metaverse has potential but also challenges, such as high costs, infrastructure limitations, teacher readiness, and a lack of digital accessibility (Onu et al., 2024). Integration is effective, but it requires not only the investment to continue professional development but also the adoption of policies while collaborating with education experts from the industry. Teachers are expected to play a critical role in the Metaverse, and existing literature emphasizes that teachers should be trained in pedagogy, digital competencies, and engagement strategies. Nevertheless, there are gaps in teacher development and engagement knowledge in this emerging digital environment (Tan et al., 2021). As such, the competence of teachers, especially readiness and digital integration, largely contributes to the success or failure of TVET in producing students ready for what the future workforce demands. Improving the challenges of digital adoption and teacher development will be the key to utilizing TVET's full potential (Rokeman et al., 2024).

The Metaverse has paved the way in various education sectors, with the introduction of Metaverse as a virtual learning tool in the field of TVET (Alhumaid, 2019; Hassan et al., 2024). Onu et al. (2024) demonstrate how the Metaverse can facilitate genuine occupational experiences free from the physical constraints of facility or location. However, there are serious obstacles for TVET teachers to produce effective teaching. A crucial problem is the unequal training of teachers on how to incorporate virtual environments into their teaching (Reddy et al., 2023). According to Falloon (2022) and Zabolotska et al. (2021), these technologies require more advanced digital competencies than teachers have, often too much. Furthermore, improper resources and infrastructure adopted by most TVET institutions in terms of Metaverse-based education make it hard for teachers to fully exploit learning through Metaverse (Hassan et al., 2024). Additionally, this also limits the pedagogical strategies that can be used to develop a more effective teaching experience. While the TVET and Metaverse offer increased interest in successfully incorporating the Metaverse into the curriculum, a large research gap surrounds how teachers can be systemically supported to advance their digital competency and pedagogical competence (Mbatha, 2024). While TPACK emphasizes digital literacy, the Metaverse is neither mentioned nor are the attendant demands discussed, and there is little research into the unique demands and the skills needed to be an effective Metaverse teacher. Furthermore, teacher engagement is overlooked in adopting Metaverse in TVET, an extremely critical area. Engagement is indispensable to bridging the competence of the Metaverse and teaching effectiveness. Lindfors et al. (2021) suggest that the more highly engaged teachers are in adopting and implementing new technologies, the better pedagogical practices they achieve. Therefore, this study attempts to explore the engagement of teachers, testing their capacity to utilize Metaverse in a way that promotes students' outcomes. Existing studies (Chen et al., 2023; Onu et al., 2024) offer some first insights into Metaverse-based teaching effectiveness. However, there is limited research on teacher development and Metaverse engagement. Thus, this study sets out to fill this gap by understanding TVET teachers' behaviors and challenges within specific geographic, political, and economic parameters and, in turn, contributes to the literature on digital education developments in TVET.

Below is the proposed research objective.
RO1: To examine the teacher development dimensions that affect teaching effectiveness through Metaverse.

RO2: To examine the mediating effect of teachers' engagement between the teacher development dimension and teaching effectiveness through Metaverse.

RO3: To examine the teachers' engagement towards teaching effectiveness through Metaverse.

According to Social Cognitive Theory (SCT) developed by Bandura (1986), individual behaviors are dynamic and interact dynamically with personal factors such as behaviors and environments. Self-efficacy is a pivotal construct in SCT. It is an individual's belief about its ability to execute specific tasks, which, therefore, affects motivation, perseverance, and responses to challenges. SCT is instrumental in shedding light on how teacher engagement fosters effective learning in immersive virtual environments under a Metaverse-enhanced TVET. In Metaverse integrated settings, teacher engagement acts as behavioral modeling, which is an important SCT element. Teachers become role models through their active involvement, which influences student behavior for observational learning, as modeled by Bandura (1986). Practical skills for technical competencies and workplace readiness are encouraged by engaged teachers who show capable behaviors in VR training for healthcare or automotive repair. Badilla-Quintana and Sandoval-Henríquez (2021) research reinforces this by showing that teacher engagement mediates between immersive learning and student outcomes.

Teacher engagement also develops collaborative and participatory practices embedded in educational practice. According to Bandura (1986), modeled behaviors change learner attitudes in a positive direction. Therefore, Metaverse instructors who participate in Metaverse environments themselves are more inclined to motivate and encourage students to participate actively. For example, repeated student practice is enhanced with a virtual welding instructor who demonstrates safety and precision. The central argument of SCT is that such a reciprocal relationship exists with teacher behavior affecting student reaction and robust learning environments parallel to real-life vocational experiences. Overall, it is shown that SCT provides a solid theoretical foundation for understanding teacher engagement and as drivers of learner experiences in Metaverse-integrated TVET. These elements allow broadcasting the gap between theory and practice, which is TVET's mission to produce competent, job-ready human resources by facilitating behavioral modeling and rendering active participation. SCT concepts weaved in the integration of such technologies (i.e., Metaverse technologies) point to the fact that schools can no longer be effective in their delivery without radical changes that make it more effective, interactive, and aligned with real vocational demands.

i. Technological Pedagogical Content Knowledge (TPACK)

According to the Technological Pedagogical Content Knowledge (TPACK) Framework (Mishra & Koeleber, 2006), the unfolding of Shulman's (1986) pedagogical content knowledge is to consider technological knowledge since educational digital tools are essential in education. TPACK comprises three cores (Content, Pedagogical, and technological knowledge) and the area of expertise (i.e., Technological pedagogical, content, and pedagogical) that intersect to create a total TPACK understanding where each knowledge area has its complementary knowledge. Especially in Metaverse Enriched TVET, teachers must harmonize the teaching pedagogy, the content, and the technological tools well for the practical usage of such technology.

For building TVET with Metaverse, TPK plays a key role in creating engaging and purposeful learning experiences. Teachers who have strong TPK can choose and apply the appropriate technological tools that match their pedagogical strategies. Such teachers create highly interactive virtual classrooms, as Orozco-Rodríguez et al. (2023). An example of this would be a VR implementation of an electrical engineering instructor guiding students through a complicated wiring system, where the students get real-time feedback about how correct their answers are. This helps to increase problem-solving skills and technical skills.

Furthermore, this TCK is important to TVET because it allows content to be presented to visualize and experiential learning in areas like culinary arts and engineering. Although Mishra and Koehler (2006) prefer TCK to assist with spreading the delivery of content through technology, he favors TCK. Hence, as argued by Tan et al. (2023), AR provides teachers a way to graphically assist students in the learning of practical competence, especially when it comes to food preparation tasks, which otherwise would be much harder without the presence of virtual representations. In the vocational context, it fills the gap between the theory and practice that teachers with robust TCK bridge.

In the end, the teacher engagement in the Metaverse-enhanced TVET is strengthened by the TPACK framework. Teachers comfortable with immersive tools demonstrate appropriate behaviors using the immersive tools (collaborative, problem-solving, and skill-focused). Using the assurance, teachers can effectively employ the Metaverse to match the training to industry requirements. For example, technology and pedagogy are integrated in TPACK, which is a base from which to integrate technology and pedagogy to achieve TVET's objectives, i.e., provide relevant and practical education. With this integration, the Metaverse is taken as a tool to create innovative and adaptive vocational learning environments.

ii. Self-Determination Theory

The self-determination theory (SDT), developed by Deci and Ryan (1985), provides a very comprehensive framework for understanding human motivation in educational settings. It stresses the fulfillment of three crucial psychological needs that fuel intrinsic motivation: autonomy, relatedness, and competence. If these needs are met, learners are more engaged, and their motivation comes from internal satisfaction. SDT thus explains how teacher engagement mediates the link between psychological needs and learning outcomes in the context of TVET enhanced by Metaverse.

From the point of autonomy, SDT also suggests that Metaverse-based TVET teachers should provide instructions that are autonomy-supportive. Teachers increase motivation by providing students with opportunities to choose and take responsibility for their learning. Chiu (2021) points out that digital teaching, which is an autonomy-supportive one, helps foster learner engagement. By giving them the freedom to choose diagnostic tools in a virtual environment in an automotive mechanics course, the students will practice the industry-relevant problem-solving characteristic of the TVET's mission to produce innovative, proactive learners.

Another vital need is met by competence when students feel capable of meeting professional demands. The establishment of this self-efficacy is done through structured instruction, feedback, and immersive simulations. The studies conducted by Cheng and Tsai (2020) indicate that teacher participation in immersive environments improves students' perceived competence. As an example, a VR-based welding class where the real time instructor feedback on angles and pressure of welding skills helps students develop accurate skills per the workforce expectations, a crucial TVET objective.

Metaverse-enhanced TVET also involves the need for relatedness or the need for social connection. Unlike other online platforms of the past, the Metaverse offers shared spaces that encourage presence and collaboration. Teachers can organize such simulations or role play activities, for example, in programs such as hospitality management so that teamwork is recreated, resembling real-life teamwork, and belonging is grown. The personal skills required in industry are reinforced, and student connectedness is improved.

Overall, the SDT provides a viable theoretical base for teacher engagement that drives the influence of Metaverse-based TVET. Educators can create a dynamic, motivational learning environment by addressing learners' psychological needs. Such practices support the

institution's determination to offer graduates who are technically strong and capable of self-directed and adaptable learning behaviors, equipped for the industry.

Professional development includes a continuous learning process for educators to keep updating their skills concerning new educational technologies and methods (Fernández-Batanero et al., 2022). Unlike traditional workshops, metaverse-based professional development allows teachers to have experiential learning by immersing themselves in VR and AR-based environments (Alfaisal et al., 2024). Interactivity, adaptability, and goes into focus on engagement and comprehension (Adami et al., 2023). Attainment of the same learning outcomes can be achieved by other people both globally and in shared virtual spaces (Brand, 2020) and even with flexible, capsule-based learning so that all needs are being met. There are, however, barriers such as technology accessibility and connectivity (Kazmi, 2023). While these are thus, Metaverse development provides a great abundance of 21st-century education (Khalil and Jumani, 2024; Cheng and Qin, 2021).

The interaction with VR, AR, and XR platforms towards the transformation of conventional educational methods is termed Metaverse tools engagement (Onu et al., 2024). The benefit of experiential and collaborative learning is also enhanced with these tools. For example, VR enables biology students to grasp complex structures, and AR assists vocational training through safe simulation (Thompson et al., 2020; AlGerafi et al., 2023). AI tutors training in VR-based settings increase motivation and minimize anxiety (Rane et al., 2023; Adıgüzel et al., 2023). However, costs, access, and shortage of teaching expertise are hurdles to widespread adoption (Yaqoob et al., 2023). Nevertheless, Metaverse tools are essential for collaboration, customization, and active learning.

The pedagogical training consists of preparing for deploying pedagogical knowledge to VR and AR in immersive education (Mohan, 2019). The Metaverse fosters experiential, active learning over traditional passive methods (Heilporn et al., 2021). It includes master training of virtual classrooms and interaction with AI avatars to improve confidence and cognition (Anderson & Putman, 2020). Part is central, which allows for teachers from presented backgrounds to co-teach and co-develop pedagogical methods (Liu et al., 2020). High costs, technical demands, and teacher resistance present barriers (Meccawy, 2022). However, this training prepares educators to address learner's diverse needs in future learning.

Teacher readiness is the preparedness and confidence of educators to use VR, AR, and XR in teaching practice (Lee & Hwang, 2023). To adapt pedagogically, technological proficiency is also needed. With their proficiency, educators can design immersive lessons, such as virtual expeditions and AR demonstrations (Pramanik, 2024). Content flexibility must exist to adapt the content for the immersive platforms (Oulahyane et al., 2024). Yet, time, funding, and institutional support often hinder readiness in instances when teachers are digitally literate (Rawat & Hagos, 2024). Because of this, Metaverse integration must rely on professional development and sustained support to be effective.

Teacher engagement also implies an active commitment to designing and delivering instruction in Metaverse (Baig, 2023). VR and AR make it possible for educators to create content specifically tailored to make their students more engaged not only through immersive experiences like virtual simulation of natural phenomena (Yıldırım et al., 2020), but also to celebrate diversity and diversity of thought in a rich sensory fashion that might establish and enrich deeper connections to each other and the subject matter. Constructivist approaches towards knowledge generation involve interaction and collaboration (Cavinato et al., 2021). There are time constraints, technological demands, and limited support, however, to sustain high engagement levels (Bakkar & Ziden, 2023). However, there is an importance in creating teacher engagement to promote innovation and active, immersive student learning.

Metaverse education's teaching effectiveness is delivering immersive impactful education with VR and AR (Chafiq et al., 2024). For example, 'learning by doing' enriches engagement and retention: e.g., a history student virtually exploring past civilizations (Makransky & Mayer, 2022). They allow real-time collaboration and hence help in teamwork and learning outcomes (Qureshi et al., 2023). However, technological challenges, resource availability, and teacher training impoverish successful implementation (Wu & Hao, 2024). Even in the face of obstacles, The Metaverse presents educational transformation in immersive and collaborative experiences that are new and different from best teaching.

The variables described above have been used to form a diagrammatic view of the research framework (Figure 1) and presents the hypothesis to be tested. To predict engagement in teaching effectiveness through Metaverse, the focus is on; the dimension of the teacher development, which includes professional development, Metaverse tools engagement, pedagogical training and teachers' readiness and teacher engagement towards teaching effectiveness through Metaverse.

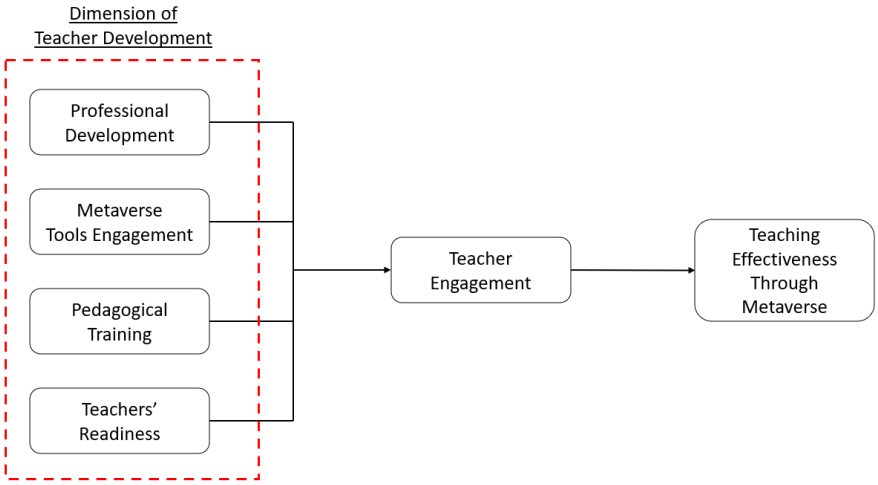

Fig. 1. Proposed Conceptual Framework

2. Proposed Methodology

It is a conceptual paper utilizing descriptive research design to focus on the mediating role of teacher engagement in Metaverse-enhanced TVET. This study is suitable for descriptive research as it allows one to explore and articulate theoretical relationships between key constructs systematically and serves as a basis for future empirical validation. The study develops a conceptual framework based on an extensive review and synthesis of relevant literature to capture how TVET education is changing with the current use of digital technologies, especially with the Metaverse.

In this conceptual paper, no empirical data collection takes place, but a potential methodological approach for future research is sketched. The suggestion is that standard data could be obtained from TVET educators who are knowledgeable with or working with Metaverse tools. The questionnaire would be packaged in a structured one using validated instruments for each construct. Existing scales used in prior studies that have operationalized variables like teacher engagement, professional development, technological self-efficacy, and teaching effectiveness can be used to operationalize variables in this study.

Inferential statistical techniques should be used to examine the proposed conceptual model for empirical future validation. Structural Equation Modelling (SEM) will be performed using Smart PLS as simply the method to analyse complex relationships between direct and indirect effects on latent variables. Moreover, preliminary analyses will include data screening,

descriptive statistics, and reliability testing, and all will be conducted using SPSS. Procedures in the Smart PLS environment, such as convergent and discriminant validity testing, will be implemented to assess the validity and internal consistency of the measurement model. Moreover, bootstrapping methods will be used to evaluate the significance of the hypothesized mediating and moderating effects. These analytical methods will be integrated to yield empirical support to the theory and meaningful insights into the ongoing debate on digital transformation in education, particularly in the context of TVET.

This conceptual paper proposes a theoretical model that puts forward the mediating role of teacher engagement in Metaverse-enhanced TVET education and contributes to the growing body of knowledge on digital transformation in education. The study integrates two well-established theories namely self-determination theory (SDT), social cognitive theory (SCT), and technological pedagogical content knowledge (TPACK) framework, to provide a holistic insight into how the professional development, pedagogical training, teacher readiness, and utilization of the Metaverse tools individually and collectively affect teachers' ability to teach effectively. This study has a key contribution in its focus on the centrality of teacher engagement as the central construct to link technological readiness and instructional outcomes. Additionally, technological self-efficacy as a moderating variable provides a nuanced perspective on how a person's confidence in technology's use could either weaken the proposed relationships. However, this conceptual framework contributes to the extension of theoretical insights and the provision of practical guidelines to policymakers, TVET leaders, and curriculum developers in implementing immersive technology in the TVET context. The study also lays the foundation for future quantitative research related to digital education based on evidence by outlining the future of an empirical validation plan.

3. Conclusion

This conceptual paper concludes by pointing out the imperative of teacher engagement in the effectiveness of Metaverse integral TVET. The study develops an understanding of these factors (professional development, pedagogical training, teacher readiness, and the role of interaction with Metaverse tools) and analyses the influence on teaching results. The proposed conceptual model puts teacher engagement into play as a middleman between technological preparedness and practical instruction. Additionally, the technological self-efficacy included as a moderating variable helps in portraying individual confidence in terms of using the technology and can add more strength or negate the proposed relationships. Further, this framework also provides practical implications for policymakers, educational leaders and curriculum developers involved in implementing immersive technologies into TVET contexts rocks. The study offers a framework for how future empirical validation could be based on evidence-based strategies for improving teaching and learning experiences in the era of digital education.

Abstract

In an era defined by rapid technological advancement and sustainability imperatives, Technical and Vocational Education and Training (TVET) institutions must equip graduates with future-ready skills that extend beyond technical proficiency. This study investigates the integration of Design Thinking (DT) into Final Year Projects (FYPs) in Malaysian polytechnics, focusing on the perspectives of both lecturers and students. DT was formally introduced into the polytechnic curriculum in Academic Session 2019/2020, yet its application in FYPs remains underexplored. Using a qualitative approach, semi-structured interviews were conducted with five participants (three lecturers and two final-year students). Data were analysed thematically using Braun and Clarke's (2013) six-phase framework, supported by *Transkriptor* software to generate codes and themes. Findings indicate that DT has been partially embedded in FYPs through workshops, supervisory practices, and curriculum briefings, providing greater structure, clarity, and user-centred orientation in student projects. Both lecturers and students recognised DT's potential to enhance creativity, problem-solving, and innovation, though challenges such as resource constraints, limited exposure, and uneven institutional support persist. Participants also expressed strong expectations of DT's long-term value in aligning FYPs with industry and community needs, while strengthening graduate employability and adaptability to Industry 4.0 and 5.0 demands. This study concludes that DT can transform FYPs into innovation-driven platforms that cultivate empathy, creativity, and sustainable problem-solving skills. It recommends structured training programmes, supportive institutional policies, and cross-disciplinary collaborations to ensure meaningful integration. These findings contribute to the growing discourse on embedding design thinking within TVET, positioning Malaysian polytechnics to nurture graduates who are both technically competent and innovation-driven.
Keywords: Design thinking; Final year projects; TVET; Innovation; Sustainability.

1. Introduction

In today's rapidly evolving global landscape, where technological advancements and sustainability imperatives redefine industry standards, Technical and Vocational Education and Training (TVET) institutions must transform their educational approaches to produce graduates equipped with future-ready competencies. Within Malaysian polytechnics, there has been a gradual shift towards not only imparting technical knowledge but also nurturing students' capacity to innovate and solve complex real-world problems. This reflects the pressing demand for graduates who are not merely technically proficient but also agile thinkers, creative problem solvers, and contributors to sustainable development.

Recognising this need, *Design Thinking* (DT) was formally introduced into the Malaysian polytechnic curriculum in Academic Session 2019/2020 as part of the broader initiative to embed 21st-century learning skills and innovation-driven pedagogy within TVET programmes. Since its introduction, DT has been integrated in selected courses, workshops, and Final Year

Projects (FYPs), offering students opportunities to apply user-centred, iterative, and creative approaches to problem-solving.
Final Year Projects (FYPs) remain a critical component of polytechnic education, providing students with opportunities to integrate knowledge and skills in addressing authentic challenges. However, traditional approaches to FYPs often emphasise procedural compliance over innovation, potentially limiting students' preparedness to navigate the demands of an unpredictable and technologically driven workforce. Embedding DT within FYPs offers a transformative framework that encourages empathy, creativity, and iterative problem-solving, enabling students to conceptualise and implement projects that are meaningful, relevant, and impactful.

Despite its potential, limited empirical research has examined how DT is currently integrated within FYPs in Malaysian polytechnics. Key issues such as stakeholders' perceptions, challenges in implementation, and the extent to which DT contributes to bridging skills, technology, and sustainability remain underexplored. Addressing this gap is essential to ensure that FYPs function not merely as academic requirements but as platforms for innovation aligned with industry demands and sustainability goals.

Therefore, this study aims to investigate the integration of DT principles into FYPs in Malaysian polytechnics by examining the experiences and perspectives of lecturers and students. Specifically, it seeks to:

i. Assess the current status and extent of DT implementation in FYP teaching and supervision.
ii. Explore perceptions, attitudes, and challenges faced by students and lecturers in integrating DT principles.
iii. Examine stakeholders' expectations regarding the potential long-term impact of DT in enhancing FYPs for innovative and sustainable problem-solving.

Through this exploration, the study contributes to strengthening TVET pathways by fostering graduates equipped with critical, creative, and sustainable innovation skills necessary for the 21st-century workforce. The landscape of education is shifting, with a growing emphasis on equipping students with skills that extend beyond traditional academic knowledge. Design thinking, a human-centered approach to innovation, offers a framework that encourages creativity, collaboration, and critical analysis. The literature review will look at the current status of FYPs in Malaysian polytechnics and the potential impact of integrating design thinking principles into these projects.

Design thinking has gained substantial traction in recent years as a human-centered approach to problem-solving. It emphasizes empathy, creativity, and iterative prototyping. Initially rooted in the field of design, design thinking has been adopted across various disciplines, including education, business, and healthcare. It serves as a means to foster innovation and address complex challenges (Adeline H., 2023).

Design thinking is typically characterized by several key principles and stages. According to Ibrahim M. N. (2019), it involves a series of iterative steps, including empathizing with end-users, defining the problem, ideating potential solutions, prototyping ideas, and testing them with users. This iterative process encourages experimentation and learning from failure, ultimately leading to the development of innovative and user-centered solutions. In the realm of education, applying design thinking principles has been shown to enhance student engagement, creativity, and critical thinking skills. According to Shah H.S (2019), design thinking fosters a mindset of "creative confidence", empowering individuals to approach problems with optimism and resilience. By encouraging students to explore multiple perspectives and iterate on their ideas, design thinking promotes a culture of experimentation and innovation within educational settings.

In the context of Final Year Projects (FYPs), there is a growing recognition of the need to move beyond traditional project management approaches and embrace more innovative and user-centered methodologies. However, research indicates that many FYPs in Malaysian polytechnics often lack real-world applicability and fail to address contemporary societal and industrial needs (Sultana et al., 2020). This highlights the importance of integrating design thinking principles into the FYP process to better prepare students for the demands of the modern workforce.

The integration of design thinking into educational practices has been shown to have several benefits for students. For example, Hasso Plattner Institute of Design at Stanford University (2017) found that students who participated in design thinking courses reported increased confidence in their ability to solve complex problems and generate creative solutions. Similarly, a study by Blikstein (2013) demonstrated that design thinking can improve students' collaboration skills and their ability to work effectively in interdisciplinary teams.

In the Malaysian context, there is a growing interest in exploring how design thinking can enhance FYPs in polytechnics. Hamdan M.I.S.B (2021) conducted a study on the implementation of design thinking in a Malaysian polytechnic and found that it led to improvements in students' problem-solving skills and their ability to develop innovative solutions. However, the study also highlighted challenges such as limited resources and resistance to change among faculty members. In Malaysian polytechnics, where the emphasis is often placed on practical skills and vocational training, integrating design thinking principles into educational practices holds the potential to enhance final-year projects (FYPs) and cultivate students' innovative problem-solving skills.

Despite the potential benefits of integrating design thinking into FYPs, there are also challenges and barriers to implementation. For example, Mandar Pandey (2020) identified factors such as time constraints, lack of faculty training, and institutional resistance as common barriers to the adoption of innovative pedagogies in higher education. Addressing these challenges will require a concerted effort from educational institutions, faculty members, and industry stakeholders to create a supportive ecosystem for design thinking in Malaysian polytechnics.

In summary, the literature suggests that design thinking offers a promising framework for enhancing Final Year Projects in Malaysian polytechnics for innovative problem solving. By integrating design thinking principles into educational practices, institutions can better prepare students for the demands of the modern workforce and foster a culture of innovation within their programs.

However, despite the growing recognition of the importance of innovation and practical problem-solving skills in Malaysian polytechnics, there remains a notable gap in the integration of design thinking principles into the planning, execution, and supervision of Final Year Projects (FYPs). While design thinking has emerged as a powerful framework for addressing complex challenges through human-centered approaches, creativity, and iterative prototyping, its application in the context of FYPs within Malaysian polytechnics has not been extensively explored. This research gap signifies a missed opportunity to equip students with the necessary skills and mindset to tackle real-world problems innovatively, thereby hindering their readiness for the dynamic demands of the modern workforce.

2. Methodology

This study employed a qualitative research design to explore participants' perspectives, experiences, and insights related to the integration of design thinking (DT) principles into Final Year Projects (FYPs) within Malaysian polytechnics. A qualitative approach was deemed

appropriate as it enabled the researcher to elicit rich, in-depth responses that capture the complexity of participants' experiences and perceptions.

Semi-structured interviews were conducted using a convenience sampling method, where subjects were selected based on accessibility and relevance to the research context. The study involved five participants in total: three lecturers (two males, one female) and two students (one male, one female) from a civil engineering programme at a Malaysian polytechnic.

While the sample size may appear small, this is consistent with the aims of qualitative inquiry, which prioritises depth over breadth. The selected participants had extensive teaching and supervisory experience (lecturers with 17–20 years in service) and were actively engaged in FYP teaching or supervision. The student participants were in their final year (Semester 4 and 5), directly involved in FYPs that integrated elements of DT. This purposeful diversity ensured that the sample could provide information-rich insights, sufficient for identifying patterns and themes relevant to the research objectives. Similar small-scale studies in design thinking and TVET contexts have adopted comparable sample sizes to generate exploratory findings (e.g., Majere, 2024; Keelson et al., 2025).

The interview protocol incorporated open-ended questions while allowing emerging issues to be explored through dialogue. Questions were designed following Carspecken's Qualitative Research Method (1996), which recommends the use of preliminary brainstorming to generate lists of key issues and questions. The semi-structured format ensured systematic coverage of the research objectives while retaining flexibility to probe participants' unique experiences. Each interview was audio-recorded with informed consent and subsequently transcribed verbatim for analysis.

Thematic analysis was conducted using Braun and Clarke's (2013) six-phase framework. Transcripts were coded iteratively, combining both deductive coding (based on the research objectives) and inductive coding (emergent themes). Coding and theme development were assisted by *Transkriptor* software, which facilitated systematic organisation of the data. Thematic categories were then refined and consolidated into three overarching areas corresponding to the study's objectives: (1) current status of DT integration, (2) perceptions and challenges, and (3) long-term expectations.

All participants were informed of the purpose of the study, their rights, and confidentiality measures. Written consent was obtained prior to participation. Pseudonyms (L1, L2, L3, S1, S2) were assigned to protect anonymity. Ethical protocols were strictly observed throughout data collection, storage, and reporting.

The small sample size and the use of convenience sampling mean that findings may not be generalisable to all Malaysian polytechnics. Nevertheless, the depth of insights generated offers valuable exploratory evidence and provides a foundation for future studies with larger participant groups.

3. Results And Discussion

Part 1 of the interview required participants to provide basic demographic information such as their name, teaching experience, current teaching responsibilities related to FYP, current semester, and students' final year project's title. Table 1 summarizes the pertinent information received from participants. All participants have at least 17 years of experience working at the institution being studied and are currently in Semester 4 and Semester 5 out of their 6th semester studying in polytechnic.

Based on the result of Part 1, it can be concluded that the years of teaching experience, the students' senior years, and their involvement in FYPs imply that the participants have adequate knowledge of design thinking principles in FYPs. Thus, though the sample size is relatively small and may weaken the effectiveness of the interview, their profound knowledge and ample experience, as proven in this part of the interview, can compensate for those weaknesses.

Table 1. Summary of information related to the participants in Polytechnic A

Participants' criteria	Lecturers (L1)	(L2)	(L3)	Students (S1)	(S2)
Gender	Male	Female	Male	Female	Male
Years of teaching experience	20	17	20	-	-
Academic background	B. Eng.	PhD.	B. Eng.	Diploma in Civil Engineering	Diploma in Civil Engineering
Current teaching responsibilities related to FYP	Design Thinking Master Trainer	FYP Supervisor	FYP1 Coordinator (Sem 4)	-	-
Current semester	-	-	-	Sem 4	Sem 5
FYP's title	-	-	-	*Kajian Penggunaan* Porous Pavement *dengan menggunakan Getah Kitar Semula*	*Pembangunan* Smart Wind Detector *untuk Amaran Angin Lintang di Lebuhraya*

Thematic analysis of the interview data generated three overarching themes, which align with the study's three objectives: i. current status and extent of design thinking (DT) integration in FYPs, ii. perceptions, attitudes, and challenges faced by students and lecturers, and iii. stakeholders' expectations of the long-term impact of DT in enhancing FYPs for innovative and sustainable problem-solving. Coding was conducted using *Transkriptor* software, with both deductive codes (guided by research objectives) and inductive codes (emerging from the data). The final themes are summarised in Tables 2 to 7, which present responses from lecturers and students across the identified categories.

Findings revealed that DT has been partially embedded into the FYP process through curriculum adjustments, supervisory practices, and student-led initiatives. Lecturers (L1 - L3) highlighted efforts such as curriculum briefings, workshops, and stakeholder involvement as strategies to familiarise students with DT principles. Students (S1, S2) demonstrated awareness of innovation in their projects, such as incorporating recycled materials and IoT elements. Although the scope of DT integration varied, both groups acknowledged that DT provided structure and clarity in problem identification and solution design.

Across both groups, perceptions of DT were largely positive. Lecturers described DT as a framework that improved student problem-solving, empathy, and user-centred thinking. Students shared that DT made projects more structured, comprehensible, and relevant to real-world applications. However, challenges were also highlighted, including limited resources, time constraints, and the need for additional training for both lecturers and students. Coding revealed recurring barriers such as "lack of resources," "time limitation," and "resistance to change," which indicate structural and cultural constraints in applying DT effectively.

Participants emphasised that DT integration has the potential to enhance the long-term quality and sustainability of FYPs. Lecturers anticipated that DT could align projects more closely with industry and community needs, while also cultivating graduates' employability and adaptability in Industry 4.0 and 5.0 contexts. Students viewed DT as a guide to improving project quality and as preparation for solving real-world problems after graduation. Codes such as "future employability," "industry relevance," and "innovation potential" illustrate the positive outlook of both groups.

The following tables (2–7) present detailed responses from lecturers and students, categorised under the three main themes. These tables illustrate how participants perceived DT's status, its benefits and challenges, as well as its long-term implications for FYPs.

Table 2. How participants perceived DT's current status (Lecturers)

Interview Transcript with Lecturers	
Interview Questions	Answers from Participants
Interview Question 1: Can you describe any initiatives or efforts that have been undertaken in our institution to incorporate design thinking principles into the teaching and supervision of final-year projects?	▪ incorporating it into the curriculum syllabus that includes providing training and guidance to both students and supervisors on how to apply design thinking in their projects (L1, L2, L3) ▪ conduct courses or briefings for students to understand the concepts of DT and its application in their projects (L1, L3) ▪ involving stakeholders and users in the design process to ensure the quality and relevance of the FYPs (L1) ▪ Supervisors play a crucial role in guiding students and aligning their understanding of design thinking principles (L2, L3) ▪ clear communication and ensuring that both supervisors and students are on the same page (L1, L2, L3) ▪ conducting thorough research and analysis at the initial stages of the projects to ensure quality outcomes (L3)
Interview Question 2: What specific strategies or methodologies have been used to integrate design thinking into the FYP process?	▪ Provide a briefing or short course to students at the beginning of the final project involving social services where students have hands-on experience with the DT concept (L1) ▪ Lecturers who have applied DT to guide the students through each step of the process (L1) ▪ Starting with problem statement identification, seeking advice to support the problem statement, and applying DT throughout the analysis and conclusion stages of the project (L2, L3) ▪ Using methods such as creative thinking, critical thinking, and various other methodologies (L3) ▪ Involves guiding students to conduct academic research, develop innovative products, and adhere to specific formats and writing styles (L3)
Interview Question 3: How do you personally engage with design thinking principles in your role as a lecturer supervising FYPs?	▪ Provide a briefing, short course, feedback, and support for students at the beginning of the projects (L1, L2, L3) ▪ Involving students in real-life situations and focusing on user needs rather than creating problems (L1) ▪ Integrating DT as part of the CDIO approach (L1) ▪ Involve stakeholders and users in the testing phase of the projects to gather feedback and make improvements (L2, L3)

Table 3. How participants perceived DT's current status (Lecturers) (Students)

Interview Transcript with Students	
Interview Questions	Answers from Participants
Interview Question 1: How do you perceive the role of innovation in the context of your final-year project?	▪ Innovation as a way to enhance existing products and make them better than before (S1) ▪ By adding innovation, the project can be improved and the product can be enhanced (S1, S2)
Interview Question 2: Have you attempted to integrate innovative solutions into your project? If so, what were the challenges you encountered?	▪ Adding recycled materials like processed rubber powder into the pavement to absorb water (S1) ▪ Integrate with IoT to enhance the product innovation (S2) ▪ The main challenge we faced was the time needed to gather information and conduct interviews with suppliers to obtain the necessary materials (S1, S2)
Interview Question 3: What specific difficulties or obstacles did you face in integrating innovative solutions, and how did you address them?	▪ Related to the process of obtaining information and conducting research (S1, S2) ▪ Required a lot of time to gather information and understand the root causes of the problem (S1, S2) ▪ The need to visit a factory and conduct detailed testing (S1) ▪ Limited resources or stock availability (S1, S2)

Table 4. Benefits and Challenges (Lecturers)

Interview Transcript with Lecturers	
Interview Questions	Answers from Participants
Interview Question 1: How do you perceive the role of design thinking principles in enhancing the teaching and supervision of final-year projects?	▪ Crucial in ensuring that projects are user-centered, relevant, and of high quality (L1, L2, L3) ▪ By applying DT, students are encouraged to address real user needs and create solutions that are effective and impactful (L1, L3) ▪ Lead to more meaningful and practical projects that can be utilized by the community or industry (L1, L3) ▪ Provide structured approach to problem-solving, fostering creativity and promoting empathy towards end-users (L1, L2) ▪ Help supervisors guide students through the project development process, fostering creativity and collaboration (L1, l2, L3)
Interview Question 2: What do you see as the potential benefits of integrating design thinking into the FYP process?	▪ Creating projects that are more user-focused and relevant (L1, l2, L3) ▪ Producing projects that are effective and usable by the community or industry (L1, L3) • DT can assist in guiding students to align their ideas with the objectives (L2) • Improving the project's quality (L1, L2, L3) • Enhancing innovation and creativity among students (L1, L3) • Facilitating user-centered design (L3) • Allowing for iterative testing and improvement of prototypes (L2, L3)
Interview Question 3 What challenges or barriers do you perceive in adopting design thinking principles in teaching and supervising FYPs?	▪ Level of understanding and acceptance (L1, L2, L3) ▪ The need for training and guidance (L1, L3) ▪ Potential resistance to change in traditional teaching methods (L1) ▪ Practical application of the principles i.e. conducting fieldwork and meeting with stakeholders may require adherence to formal procedure and protocol when interacting with external organizations or agencies (L3) ▪ Ensuring that students can effectively translate theoretical knowledge into practical skills and solutions (L1, L2, L3)

Interview Transcript with Lecturers	
Interview Questions	Answers from Participants
Interview Question 4 How do you think these challenges can be addressed or overcome?	▪ Provide more hands-on practical training in DT, rather than just theoretical lectures (L1, L3) ▪ Provide real-life examples and scenarios (L1, L2) ▪ Regular feedback and guidance from supervisors (L2) ▪ Establish proper procedure (L1, L3) ▪ Actively seek out information (L3)

Table 5. Benefits and Challenges (Students)

Interview Transcript with Students	
Interview Questions	Answers from Participants
Interview Question 1: How familiar are you with design thinking principles, and do you believe they could enhance your FYP experience?	• DT could enhance their FYP experience by providing guidance and facilitating problem-solving (S1, S2)
Interview Question 2: What do you think would be the benefits of incorporating design thinking principles into FYPs?	▪ DT makes projects easier to understand (S1, S2) ▪ clearer in terms of objective (S1) ▪ help students in problem-solving and decision-making in real-life situations (S1)
Interview Question 3: From your perspective, what barriers or challenges might lecturers face in adopting design thinking principles in teaching and supervising FYPs	▪ Understanding and implementing DT principles ▪ Adapting lecturers teaching methods to incorporate DT effectively ▪ Encounter resistance from students who are unfamiliar with DT ▪ Lack of resources ▪ Time constraint ▪ The need for additional training

Table 6. Long-term Implications for FYPs (Lecturers)

Interview Transcript with Lecturers	
Interview Questions	Answers from Participants
Interview Question 1: Do you believe that the integration of design thinking methodologies will positively impact the alignment of student projects with real-world challenges and industry needs? Why or why not?	▪ DT focuses on understanding user needs and creating solutions that are relevant and effective (L1, L2, L3) ▪ Students will be able to address actual problems faced by users and industries (L1, L3) ▪ DT encourages empathy, idea generation, prototyping, and testing which are essential elements in addressing real-world problems effectively. (L2, L3) ▪ Students will have a better understanding of how to approach and solve complex challenges (L3) ▪ Students are likely to develop a deeper understanding of real-world challenges (L1, L3)
Interview Question 2: What are your expectations regarding the long-term outcomes of integrating design thinking into FYPs?	▪ Projects will be of higher quality and more relevant to the needs of users or communities (L1, L2, L3) ▪ Students will be able to execute their projects well (L2) ▪ Students need to understand DT from the start (L2) ▪ Improved innovation (L1, L3) ▪ Better user feedback and product testing (L3) ▪ Overall enhancement of the FYP experience for students (L1, L2, L3)
Interview Question 3: How do you envision design thinking contributing to the overall quality and relevance of student projects in the future?	▪ Ensuring that the projects are based on real user needs and problems (L1, L2, L3) ▪ Students will be able to create solutions that are truly effective and impactful as they will be addressing genuine issues faced by users (L2, L3)

	▪ Providing a structured approach to problem-solving and innovation (L2, L3)

Table 7. Long-term Implications for FYPs (Students)

Interview Transcript with Students	
Interview Questions	Answers from Participants
Interview Question 1: Do you believe that integrating design thinking methodologies into FYPs will positively impact the alignment of student projects with real-world challenges and industry needs? Why or why not?	▪ Helps students understand the problem-solving process (S1, S2) ▪ Encourages innovative solutions that are practical and relevant to real-world situations (S1) ▪ Students are better equipped to address industry needs and create impactful projects (S2)
Interview Question 2: How do you envision design thinking contributing to the overall quality and relevance of FYPs in the long run?	▪ Provide a structured approach to problem-solving and innovation (S1, S2) ▪ Help students better understand the needs of users (S1) ▪ Generate creative ideas (S2) ▪ Iterate on solutions to create impactful projects (S2) ▪ Prepare students for real-world challenges (S1) ▪ Improve overall effectiveness (S1, S2)
Interview Question 3: What outcomes or changes do you hope to see as a result of incorporating design thinking into the FYP process?	▪ Hope to see improvements in the quality of projects (S1, S2) ▪ Easier understanding for students (S1) ▪ The ability to solve real-life problems more effectively (S2)

The findings of this study highlight the significance of integrating design thinking (DT) principles into Final Year Projects (FYPs) in Malaysian polytechnics. By thematically analysing the perspectives of lecturers and students, three key areas were identified: current status of DT integration (Objective 1), perceptions and challenges (Objective 2), and long-term expectations (Objective 3).

The study reveals that DT has been partially integrated into FYPs through curriculum briefings, workshops, supervisory practices, and student initiatives. This aligns with prior studies (Hamdan, 2021; Cheah, 2012) which suggest that embedding DT within academic projects enhances students' ability to approach problem-solving systematically. However, inconsistent implementation across departments and limited institutional support remain barriers, echoing the challenges highlighted by Mandar Pandey (2020) regarding adoption of innovative pedagogies in higher education.

Both lecturers and students perceived DT positively, identifying it as a framework that enhances problem-solving, empathy, and innovation. Students reported that DT provided greater clarity and structure in conducting projects, consistent with findings by Henriksen et al. (2017) that DT cultivates creativity and confidence. Nevertheless, recurring challenges included resource constraints, time limitations, and varying levels of understanding among lecturers and students. These barriers indicate the need for capacity-building initiatives and institutional support to strengthen DT application.

Participants anticipated that DT would enhance the relevance and sustainability of FYPs by aligning them more closely with industry and community needs. Lecturers expected DT to improve graduates' employability and innovation capacity, while students viewed it as preparation for tackling real-world challenges. This expectation resonates with Dell'Era et al. (2020) and Noh & Abdul Karim (2021), who argue that DT fosters adaptability and future-ready skills aligned with Industry 4.0 and 5.0 demands. The findings underscore the importance of sustaining DT integration as a long-term educational strategy in TVET.

4. Conclusion

Overall, this study demonstrates that design thinking can transform FYPs from procedural academic tasks into innovation-driven platforms. The integration of DT enhances students' creativity, critical thinking, and capacity to address authentic problems. However, its impact is limited by resource constraints, lack of structured training, and uneven adoption across institutions.

To address these challenges and maximise the benefits of DT in FYPs, several measures are recommended:

i. Structured Training Programmes - Provide continuous training for both lecturers and students to strengthen their understanding and practical application of DT.
ii. Supportive Institutional Policies - Develop policies that incentivise innovative teaching approaches and allocate resources for prototyping, workshops, and stakeholder engagement.
iii. Cross-Disciplinary and Industry Collaboration - Encourage collaborative projects that involve multiple disciplines and industry partners to enhance the real-world relevance of FYPs.
iv. Future Research - Conduct larger-scale studies to evaluate the quantitative impact of DT on employability and innovation skills, as well as longitudinal studies to track graduates' adaptability and professional growth.

By adopting these strategies, Malaysian polytechnics can ensure that FYPs not only fulfil academic requirements but also function as platforms for cultivating future-ready graduates who can drive technological advancement, innovation, and sustainable development.

Abstract

Blended learning has been proved to bring improvement in the teaching learning process. This study's investigation of the Vocational College students' perception, attitude and their readiness to adopt blended learning in the subject of secretarial. The target population was the senior Vocational College students. Three colleges were randomly selected from the three colleges in Kelantan. Twenty students were randomly selected from each of the colleges totalling 60 in all. Questionnaires were administered to all the 60 students and the data collected was analysed using frequency counts and means(x). The findings based on the three research questions raised revealed that the student's perception towards the usefulness of blended learning was positive, the attitude was positive, and the students were ready to adopt blended learning. It was therefore recommended amongst others that seminars, workshops, in-service training and conferences should be organized for teachers for a blended learning approach to have a smooth take off.
Keywords: Learning Meeting Minutes, E-Learning.

1. Introduction

Traditionally, Teaching has been viewed as a process of delivering to students what is required without any opportunity for questioning. This means that the teacher has the monopoly of knowledge required to be imparted. However, in the modern sense teaching is an attempt to help someone acquire a change of attitude, knowledge, ideal, skills or appreciation (Adedapo, 2004). Mkpanang (2005) explained that the concept of teaching implies that a set of stimuli is initiated and regulated by an individual who has been professionally trained to do so. Ayodele (2002) opined that what is learnt by students is a function of how it is taught. Successful teaching therefore requires that the students make sense out of what they are taught. There is therefore a growing consensus among education leaders, researchers and educators around the world that teaching and learning must change to help students develop the skills they will need to succeed in the 21st century (Ananiadou & Claro, 2009).

The traditional teaching method, as good as it is, has its shortcomings. According to Lalima and Dangwal (2017), traditional teaching is failing to meet the individual needs of all the students in the class basically due to improper pupil teacher ratio and it is not adapting itself to meet the challenge of teaching physically challenged students. Moreover, children from deprived groups, from the areas that are geographically isolated, and medically unfit students are not able to gain benefit from this formal traditional mode of teaching. Courses are also not regularly revised, books are not updated, and teachers are not interested in upgrading their knowledge and professional skills.

A Comparative Analysis of Traditional Education System Vs e-Learning has pointed out some main disadvantages of teacher-centric learning. Student-centric and Teacher-centric Learning. In addition to teaching equipment and teaching formats, traditional and modern education can also be differentiated by learning focus. The traditional education method is teacher-centric learning and modern education is learner-centric learning. Teacher-centered

learning is usually a traditional lecture-style class where the teacher manages and leads students to learn (Anderson, 2022).

Olasedidun (2014) opined that to address the inadequacies of traditional teaching, innovative tools will have to be used in teaching. The use of innovative methods in educational institutions has the potential not only to improve but also to empower people, strengthen governance and galvanize the effort to achieve human development for the country. The concepts of paperless and pen less classrooms are thus emerging as an alternative to the old teaching learning method. There is now a democratization of knowledge, and the role of the teacher is changing to that of facilitator. Technology and ease with which it can be accessed have changed the way we live and work. Today's students will not only compete with students that sit next to them but also with their peers from across the globe.

Modern Teaching Methods: Being in the 21st century, there becomes an insistent need to introduce technological requirements in the education system at all levels. The education system has been changing and introducing new methods of teaching which have a completely different view and approach towards the educational teaching and learning system. Teachers teach every student as an individual recognizing that each student has his own needs, interests and way of thinking and learning. The students' needs are highly considered. Students are more active in class, the methods are based on activities which completely involve them into the process of learning. Students actively participate to gain knowledge and improve their skills and aid them face any kind of challenges in the future, in which the teacher only guides and leads them to reach their goals. (Mehta, 2019).

Effective teaching is the designed goal of every teacher. In effective teaching the teacher uses certain approaches and tools to help students learn and flourish. Students can learn better when the teacher uses effective teaching methods. (Mazarin J, 2021). The educational system at present is in a transition stage. To meet the challenges of expansion and catering to individual needs, it is trying to adopt new technologies and exploring new paths to reach the goal of quality educational opportunities for all. At the same time due to various factors like deficient budgets, lack of facilities, advantages of face-to-face interaction, it is not completely ready to leave the traditional modes of knowledge transfer (Lalima & Dangwal, 2017). The use of technology to augment teaching and learning is therefore inevitable. The increased access to technology in the classroom has improved the potential for teachers to optimize student learning through a combination of both online learning programmes and face-to-face student/teacher interaction. Blended learning is therefore an approach that is gaining increased attention from teachers and administrators to optimize the use of technology in their classrooms.

Dziuban, Hartman & Moskal (2004) defined blended learning as a pedagogical approach that combines the effectiveness and socialization opportunities of the classroom with the technologically enhanced active learning possibilities of the online environment, rather than a ratio of delivery modalities. According to Downes (2008), it is essentially traditional in-class learning supplemented by online activities and resources. In addition, Stacey & Mackey (2009) defined it as the combination of technology and traditional face to face instruction while Christensen, Horn & Stacker (2003) described it as a formal education programme in which a student learns at least in part through online learning with some element of student control over time, place, path and/or pace and at least in part at a supervised brick-and-mortar location away from home.

Blended learning is not about technology itself; it is about the shift in the instructional model to personalized, student-centered learning to ensure each student's success (Patrick, Kennedy & Powell, 2013). Adopting a blended learning approach offers the appeal of combining different learning elements using the power of ICT while retaining a human touch (Department of Education and Early Childhood Development, 2012)

Blended learning models, developed from early experimentation, place the student at the centre of the learning process, harnessing the power of technology to create more engaging, efficient and success-oriented learning environments. In these models, educators quickly identify gaps in learning and differentiate instruction to ensure that failure is not an option. The common blended-learning programmes include rotation, flex, A la Carte and enriched virtual. The rotation model has four sub-models which are station rotation, lab rotation, flipped classroom and individual rotation (Horn, Stacker & Christensen, 2014).

The advantages of blended learning as highlighted by Lalima & Dangwal (2014) are listed as:

i. As part of learning is done through ICT, online or offline mode, so teachers and students get more time in the classroom for creative and cooperative exercise.
ii. Students gain advantage of online learning and CAI without losing the social interaction element and human touch of traditional teaching.
iii. It provides more scope for communication.
iv. Students become more techno-savvy and they gain enhanced digital fluency
v. Students have more strengthened professionalism as they develop qualities like self-motivation, self-responsibility and discipline.
vi. It updates course content and so gives new life to established courses.

However, the implementation of blended learning is not an easy task. Certain fundamental preparations in all the teaching learning process elements (teacher, student, content and infrastructure) will be required. Some of the basic requirements include well trained teachers; teachers with the scientific attitude; teacher with wider outlook and positive approach toward change; complete facilities like well-furnished computer laboratory, internet connection, provision for video chatting; students having access to internet on their private computer; flexibility in the system; fully aware and agreed parents; and formative evaluation and continuous internal assessment (Lalima & Dangwal, 2017).

If blended learning will be relevant within an education context, the students' perception of the usefulness, attitude and their readiness to use it must be looked into. Anderson & Dron (2011) explained that the responsibility of a teacher is not just to define, generate or assign context, but it is to help learners build learning paths and make connections with existing and new knowledge resources.

Perception is the process by which organisms intercept and organize sensation to produce a meaningful experience of the world (Falade, 2011). Attitude is an accumulation of information about an object, person, situation or experience… a disposition to act in a positive or negative way toward some object. It is the controller of actual behaviour of an individual, consciously or unconsciously (Littlejohn 2002). Readiness means planning to do something. It is a matter of willingness from the heart. Olumoorin (2008) explained that successful integration of ICT depends not only on awareness and availability but also on the extent to which instructors are willing to use it. Hence the need for this study, perception, attitude and Vocational College students' readiness to use blended learning in teaching.

The integration of new mobile technology and online media is proving highly effective in helping schools meet the expectations of 21st century learners while addressing the challenges of limited resources and the special needs of many students. However, not everyone is happy with the term blended learning. Oliver and Tingweln (2003) in their article "Can blended learning be redeemed?" argued that blended learning is ill-defined and muddled as a description of particular forms of teaching with technology.
Moreover, there is a growing worldwide trend in initiatives that are explicit about the availability of learning anywhere, anytime. The underpinning notion is that teachers will need to be up-skilled quickly to cope with the virtual learning opportunities in the classroom. This study

therefore sought to find out Vocational College students' perception, attitude and readiness to adopt blended learning in instruction.

The purpose of this study was to investigate Vocational College students' perception, attitude and readiness to adopt blended learning. Specifically, the study sought to find out:

i. The perception of Vocational College students towards the usefulness of blended learning in the subject of secretarial.
ii. The attitude of Vocational College students towards adopting blended learning in the subject of secretarial.
iii. The readiness of Vocational College students towards adopting blended learning in the subject of secretarial.

This study attempted to answer the following questions:

i. What is the perception of Vocational College students towards the usefulness of blended learning in the subject of secretarial?
ii. What attitude do Vocational College students have towards adopting blended learning in the subject of secretarial?
iii. Are Vocational College students ready to adopt blended learning in the subject of secretarial?

2. Methodology

Descriptive survey design was adopted for the study to find out the perception, attitude and readiness of Vocational College students to adopt a blended learning approach in the subject of secretarial. The target population for the study consisted of all senior Vocational College students particularly those in Kelantan State based on their relevance to perceived usefulness, attitude and readiness to adopt a blended approach in the subject of secretarial. The questionnaire contained two major sections. Section I dealt with the students' biographical information while section II was sub-divided into three to take care of the three research questions. Each of these sub-divisions contained 5 items. The response mode for the items was likert response modes of Strongly Agree (SA), Agree (A), Disagree (D) and Strongly Disagree (SD). The instrument was given to educational evaluation and computer experts for validity. The reliability of the instrument was determined section by section based on the three major variables. For perceived usefulness, the Cronbach's alpha was 0.87, attitude 0.93 and readiness, 0.89.

The researcher personally administered the copies of the questionnaire to senior Vocational College students in all the three sampled Vocational College students with the help of the vice-principals and teachers in each of the schools. The questionnaires were given to the students and with the assistance of the teachers, the researcher was able to collect back all the questionnaires in each of the colleges. The analysis and interpretation of data obtained through the questionnaire was done using descriptive statistical design. The frequencies were converted to mean (x) to answer the research questions. Section II that contained items to answer the research questions was ranked 4 for Strongly Agree, 3 for Agree, 2 for Disagree and 1 for Strongly Disagree for questionnaire items that were positively worded and vice versa for items that were negatively worded.

3. Results and Discussions

The innovative results of this study are findings from the E learning Meeting which is a case study of a group of students studying in the secretarial programs from 3 selected vocational colleges in the state of Kelantan, including Pengkalan Chepa Vocational College, Bachok and Pasir Mas. This learning innovation is done through E learning which can be accessed through the following links and attachments, https://sites.google.com/moe-dl.edu.my/kesetiausahaan pentadbiran/bahan-pdp/bkp-304-meeting/what-are-meeting-minutes (refer to attachment A).

Research Question 1: What is the perception of Vocational College students towards the usefulness of blended learning in the subject of secretarial?

Table 1. Analysis of students' perception towards the usefulness of blended learning in the subject of secretarial.

S/N	Perceived usefulness of blended learning	Mean (x)
1	Blended learning will make me finish the content of each subject early	3.40
2	The teaching learning process will be easier with the use of blended learning	3.34
3	Blended learning will reduce stress and tension inherent in classroom teaching	2.98
4	The use of blended learning will improve my academic performance	3.26
5	Blended learning will make lesson more interesting	3.29
	Grand mean (x)	3.25

Table 1 reveals that making students complete the content of each subject early was ranked highest, with a mean score of 3.40 out of 4. The lowest mean score was 2.98 (approximately 3.00) with the statement that blended learning will reduce stress and tension inherent in classroom teaching. However, the grand total mean score for perceived usefulness was found to be 3.25. Using 2.0 as the average benchmark, it can then be inferred that Vocational College students perceived the usefulness of blended learning in the subject of secretarial positively.

Research question 2: What attitude does Vocational College students have towards adopting blended learning in the subject of secretarial?

Table 2. Analysis of students' attitude does Vocational College students have towards adopting blended learning in the subject of secretarial.

S/N	Attitude towards using blended learning	Mean(x)
1	Blended learning is not adequate for Vocational College	3.06
2	I will never offer a subject that will force me to use blended learning	3.42
3	Online environments are not meant for teaching and learning	2.86
4	Blended learning will make students to become lazy	3.29
5	Many students will fail if blended learning is adopted in Vocational College the subject of secretarial	3.17
	Grand mean (x)	3.16

Table 2 reveals that students did not agree with the statement that they will never offer a subject that will force them to use blended learning, with the highest mean score of 3.42 out of 4. The lowest mean score was 2.86 with the statement that online environments are not meant for teaching and learning. However, the grand mean score for the attitude of students was found to be 3.16. Using 2.0 as the average benchmark, it can be deduced that the students have a positive attitude towards adopting blended learning in the subject of secretarial.

Research Question 3: Are Vocational College students ready to adopt blended learning in the subject of secretarial?

Table 3. Analysis of students' readiness to adopt blended learning in the subject of secretarial.

S/N	Readiness to adopt blended learning	Mean(x)
1	I wish I never have anything to do with blended learning	3.52
2	I will always prefer normal classroom learning	3.40
3	I can never be convinced to use blended learning	2.47
4	I will rather drop out from school than to adopt blended learning	3.61
5	Atrocities that people perform online will never make me adopt blended learning	3.38
	Grand mean (x)	3.48

Table 3 reveals that students will never decide to drop out from school because of the adoption of blended learning with the highest mean score of 3.61 out of 4. The lowest mean score of 3.34 was associated with the statement that the atrocities that people perform online will never make me adopt blended learning. The grand mean score for the readiness to adopt blended learning was found to be 3.48. With 2.0 as the average benchmark, it can be inferred that Vocational College students are ready to adopt blended learning in the subject of secretarial.

This study found out that:

i. The perception of Vocational College students towards the adoption of blended learning in the subject of secretarial is positive.
ii. Vocational College students have a positive attitude towards the adoption of blended learning in the subject of secretarial.
iii. Vocational Colleges students are ready to adopt blended learning in the subject of secretarial.

4. Conclusion

Through a combination of online learning and more customized face-to-face direct instruction, students will be afforded the opportunity to experience student-centered learning, teacher mentoring, as well as the opportunity to self-direct their learning. Moreover, blended learning has a very high potential to help teachers better address the needs of the students. However, teachers must be encouraged to be ready to adopt the blended learning approach to be able to achieve the benefits. Based on the findings of this study, the following recommendations were made the government should be ready to provide equipment that will make online learning possible in all vocational colleges. Seminars, conferences and workshops should be organized for the teachers who are to help in the implementation of the blended learning approach. Students should be encouraged to remain focused when online and should use the equipment strictly for academic purposes only.

DESIGN OF INTERACTIVE 3D ANIMATION AS AN EDUCATIONAL MEDIUM FOR COMPUTER SHORTCUT KEY FUNCTIONS USING THE MULTIMEDIA DEVELOPMENT LIFE CYCLE (MDLC) METHOD

Jonatan Priji Tambunan*, Mesran

Management Study Program, Sekolah Tinggi Ilmu Manajemen Sukma, 20219 Medan, North Sumatra, Indonesia

*Corresponding author e-mail address: tambunan050802@gmail.com

Abstract

This study aims to design an interactive 3D animation as a learning medium to explain the functions of shortcut keys on computers. The main issue addressed is the lack of engaging and interactive visual learning media to help novice users understand keyboard shortcut functions. The method applied is the Multimedia Development Life Cycle (MDLC), which consists of six stages: concept, design, material collection, assembly, testing, and distribution. The final product is a 3D animation visualized using Blender 2.93 and edited with CapCut to produce the final video. This medium presents a simulation of commonly used shortcut keys, such as Ctrl+C, Ctrl+V, Alt+Tab, with clear and easy-to-understand visuals. Internal testing results show that this medium is feasible for use as a self-learning aid.
Keywords: 3D Animation; Keyboard Shortcuts; MDLC

1. Introduction

Keyboard shortcuts are combinations of keys on a keyboard that serve specific functions to expedite certain commands when using a computer. The use of shortcuts can significantly improve work efficiency, especially in areas such as graphic design, document processing, and programming. However, in reality, many computer users—particularly students or beginners—still do not fully understand the functions and benefits of shortcut keys. Observations indicate that many students or novice computer users struggle to remember and comprehend the existing shortcuts. This mainly happens because the available learning media are still text-based or static images. Such media are considered less interactive and insufficiently engaging to motivate users to learn. This issue is the main problem addressed in this study through the development of an interactive 3D animation-based learning medium. This is in line with Fauziah et al. (2022), who found that the use of interactive 3D animation can significantly improve students' conceptual understanding.

Several previous studies have discussed the effectiveness of interactive learning media. Farezi et al. (2025) stated that the use of keyboard shortcuts can improve time efficiency and reduce error rates in daily tasks compared to traditional methods. Similarly, Farezi et al. (2025) also demonstrated that keyboard shortcuts play a vital role in enhancing computer users' work efficiency. Tanus, Sumual, & Kumajas (2022) in their study used the Multimedia Development Life Cycle (MDLC) method to develop a 3D animation tutorial learning medium, which proved feasible and helpful in the learning process.

Moreover, Pricilia & Putri (2024) added that 3D animation as an educational medium can effectively increase enthusiasm and motivation for learning, as well as accelerate material comprehension for children in an enjoyable way. Therefore, this study introduces a different approach by combining 3D animation and interactivity to make learning more enjoyable, engaging, and easy to understand.

This research employs the Multimedia Development Life Cycle (MDLC) method, consisting of six stages: concept, design, material collection, development, testing, and distribution. According to Lisana (2022), the MDLC method comprises six stages, namely concept, design, material collection, development, testing, and distribution. This method is deemed suitable because it focuses on systematic and structured stages in multimedia product development. Consequently, the produced learning media undergoes clear evaluation at each stage. The expected outcome is an interactive learning medium in the form of 3D animation. It visually and practically explains the functions of computer shortcut keys. This medium is intended for students and the general public who wish to learn computer skills independently in an enjoyable way.

With the availability of this interactive 3D animation-based learning medium, users can directly interact with the animation objects. They can understand shortcuts through realistic simulations. This is expected to enhance users' memory and motivation in learning keyboard shortcuts. Based on the problems and explanations presented above, the researcher is interested in developing a fun and easy-to-understand learning medium through an interactive 3D animation approach. Similarly, Rinaldi et al. (2021) demonstrated that the MDLC method is effectively applied to develop interactive multimedia animation that enhances learning outcomes.

2. Methodology

The stages of this research consist of several steps: problem identification, data collection, literature study, method implementation, and conclusion drawing. The researcher identifies problems to determine the challenges faced by novice computer users. Next, data is collected through a literature study from various sources such as books, journals, and the internet. Then, the Multimedia Development Life Cycle (MDLC) method is applied to design and develop the learning medium. Finally, the researcher draws conclusions from the research results:

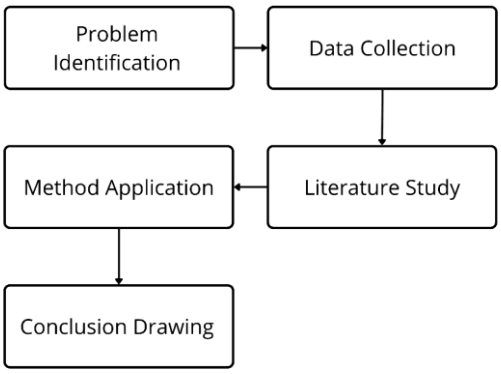

Fig. 1. Research Stages

The following is an explanation of each stage shown in Fig 1:

i. Problem Identification
   The first step is to identify the problem to be studied. In this stage, the researcher formulates the background, defines the research questions, and explains why the problem is important to address. The purpose is to ensure that the research has a clear and focused direction.
ii. Data Collection
   The second stage is data collection, which is carried out to obtain information relevant to the problem that has been identified. The methods can include observation, interviews, questionnaires, document studies, or literature reviews. In this research, data was obtained through a literature study or secondary data sources.
iii. Literature Study

At this stage, the researcher reviews literature or theories that support and are relevant to the problem being studied. The literature study helps identify theoretical foundations, compare previous studies, and enrich the knowledge base that will serve as a reference.

iv. Method Application
This stage is the core of the process, where the researcher applies the research method that has been designed. For example, using the MDLC (Multimedia Development Life Cycle) method in the development of learning media. This stage includes the design, production, testing, and refinement of the product/media.

v. Conclusion Drawing
The final stage is to draw conclusions based on the results obtained. Conclusions should address the research questions and objectives. This stage may also provide suggestions for future development or practical recommendations.

Animation is a technique for creating the illusion of motion by displaying images in sequence. In the multimedia field, animation is widely used to convey information in a more interesting and interactive way. According to Daniati, Mulyadi, & Nugroho (2021), animation is used in various fields such as education, entertainment, and promotion because of its ability to capture the audience's attention.

One rapidly developing type of animation is three-dimensional (3D) animation. 3D animation uses digital objects in three-dimensional space with height, width, and depth. 3D animation enables more realistic and dynamic object visualization (Rasiwan et al., 2023). With detailed and moving visual elements, 3D animation helps users understand abstract topics, such as keyboard shortcut functions. For example, in computer learning media, 3D animation can be used to show keys lighting up when pressed, along with sound and function information. This creates a more engaging and efficient learning experience.

A keyboard shortcut is a specific combination of keys used to speed up commands within a computer system. The use of shortcuts is highly important in the digital work environment, as it saves time and reduces dependence on the mouse.

Shortcuts are generally divided into several groups. Common shortcuts include commands for copying, pasting, and undoing actions (like Ctrl + C, Ctrl + V, Ctrl + Z). Navigation shortcuts help switch between applications, such as Alt + Tab or Ctrl + Tab for changing windows. System function shortcuts include combinations like Ctrl + Alt + Del and Windows + D for settings or quickly displaying the desktop. Standard keyboards on modern computers typically have 104 to 108 keys, depending on the model and layout. The keyboard used in this study is the standard Windows keyboard (ANSI 104-key layout), as it is the most commonly used type in desktop computers in Indonesia. Each key can be combined to form functional shortcuts, ranging from basic operations to advanced settings. Shortcuts are an essential skill for students learning computers, as they provide significant efficiency in software operation (Rahayu, Astawan, & Ambara, 2024). The following Table 1 shows examples of shortcut keys that are the focus of the learning media:

Table 1. List of Keyboard Shortcuts Used

No	Keyboard Shortcut	Action
1	Ctrl + A	Select all content or text
2	Ctrl + C (or Ctrl + Insert)	Copy selected item to clipboard
3	Ctrl + X	Cut selected item to clipboard
4	Ctrl + V	Paste content from clipboard
5	Ctrl + Z	Undo an action
6	Ctrl + Y	Redo an action

7	Ctrl + Shift + N	Reset style to normal
8	Alt + F4	Close active window; if none, shutdown menu appears
9	Ctrl + D (Del)	Delete selected item to Recycle Bin
10	Shift + Delete	Permanently delete item without Recycle Bin
11	F2	Rename selected item
12	ESC	Close current task window
13	Alt + Tab	Switch between open application windows
14	Windows key + 1	Open Settings application
15	Windows key + A	Open Action Center
16	Windows key + L	Lock the computer
17	Windows key + V	Open clipboard
18	Windows key + Shift + S	Take partial screenshot with Snip & Sketch
19	Windows key + Left	Snap window to left (split screen mode)
20	Windows key + Right	Snap window to right (split screen mode)

Multimedia learning is a teaching approach that combines text, images, audio, video, and animation. Hendra et al. (2023) state that multimedia learning helps students understand material through more than one sense, ultimately improving memory retention and interest in learning.

In general, there are two common multimedia approaches: linear multimedia and interactive multimedia. Linear multimedia delivers material sequentially without user interaction, so the user acts solely as a passive recipient of information. Meanwhile, interactive multimedia enables users to control the learning process. For example, they can select material, pause, or replay specific sections. This makes the learning process more flexible and tailored to individual needs.
In this study, an interactive approach based on 3D animation is used to introduce keyboard shortcut functions. With this approach, users can learn while directly trying out shortcut features in the displayed simulation.

The Multimedia Development Life Cycle (MDLC) method is one of the approaches used to develop multimedia products:

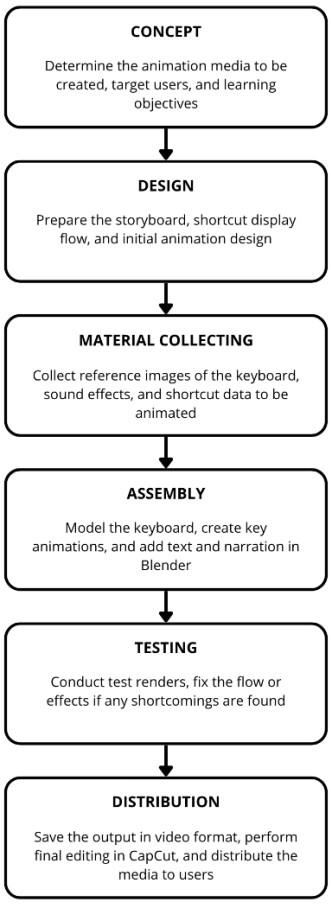

Fig. 2. MDLC Method

The following is a description of each stage shown in Fig. 2:

i. Concept: The initial stage to determine objectives, target users, and the main ideas for the multimedia to be developed.
ii. Design: Designing the user interface, interaction flow, animation storyboard, and mapping out required functions.
iii. Material Collecting: Gathering materials such as images, audio, video, and literature data to be used in the learning media.
iv. Assembly: The process of creating and combining all multimedia elements according to the design that has been made.
v. Testing: The testing stage to evaluate whether the developed media works as planned, both in terms of functionality and its effectiveness as a learning medium.
vi. Distribution: The final stage involves distributing the product to end users, whether through offline media (CD/DVD) or online (web, applications, or learning platforms).

Roedavan, Pudjoatmodjo, & Putri Sujana (2022) explain that the MDLC method is very suitable for developing learning media because it is systematic, flexible, and able to accommodate changes during the production process. In this study, all stages are carried out based on literature data since the object is keyboard shortcuts.

The type of research used in this thesis is Research and Development (R&D). According to Rangkuti (2019), research and development is a method used to produce a particular product and test the effectiveness of that product. With this approach, the researcher not only designs but also ensures that the developed product can meet user needs and is feasible to be used in the learning process. This study aims to produce a product in the form of an interactive 3D animation learning medium to explain the material on the functions of shortcut keys on a computer.

Development research is appropriate when the researcher aims not only to explain a phenomenon but also to design and produce a tangible product. This product can be directly used by users. In this context, the resulting product is multimedia-based learning media that can support self-study as well as serve as supplementary material for classroom learning. The approach used in this study is descriptive qualitative, which describes the processes, stages, and results of media development systematically and in depth without using statistical calculations. According to Prasetyo (2021), "qualitative research is a method based on the philosophy of post-positivism, used to study natural object conditions, where the researcher acts as the key instrument, data collection techniques are triangulated, data analysis is inductive/qualitative, and the research results emphasize meaning rather than generalization." In this research, this approach is used to describe the product development process through the stages of the MDLC method, starting from planning, design, material collection, to the distribution of the designed learning media.

The data collection method in this research is conducted through a literature study, which involves collecting and reviewing information from various written sources relevant to support the design process of the interactive 3D animation learning medium. Sources used include computer and multimedia textbooks, national scientific journals, online academic articles, and technical documents related to keyboard shortcuts and 3D animation.
According to Muhammad Rizal Pahleviannur et al. (2023), a literature study is a scientific approach conducted by searching, reading, and critically reviewing various reference sources. This process helps find theoretical foundations and concepts that support the research. This method is very suitable for development research, especially when it does not involve direct respondents.

The steps for data collection in this research include:

i. Determining keywords relevant to the topic (keyboard shortcuts, 3D animation, MDLC),
ii. Accessing various sources from campus repositories, national journals, and online libraries,
iii. Selecting references based on relevance, credibility, and publication year (maximum of the last five years),
iv. Analyzing and organizing the gathered information as the basis for the design and development process of the learning media.

Through this method, the researcher can gather essential information as a foundation in the design process of the MDLC-based learning media to be developed.

The data analysis technique in this research uses a descriptive qualitative approach. This technique is used to analyze data obtained from literature studies in the form of books, journals, and articles relevant to the topics of keyboard shortcuts, 3D animation, and multimedia learning.

According to Miles & Huberman (2020), qualitative data analysis consists of three interrelated activities:

i. Data Reduction
   The process of sorting, focusing, simplifying, and transforming raw data from various references into relevant information needed for product development.
ii. Data Display
   The filtered data is then organized in the form of narratives, tables, and diagrams that help visualize the process of designing the learning media.
iii. Conclusion Drawing and Verification
   The analyzed data is used to draw conclusions in the form of media design concepts, shortcut material content, and the structure of the 3D animation visualization. Verification is carried out by comparing data from several different sources to ensure accuracy.

This approach is considered the most appropriate for this type of development research. It focuses on understanding the process, meaning, and context rather than measuring numbers or statistics. In this study, the data analysis stage also includes an internal testing procedure to ensure the developed 3D animation media functions properly. This internal test involves verifying all animation scenes, text, and audio narration so that they align with the intended shortcut functions. Any minor errors found during the functional checks were corrected immediately to maintain media quality. This step-by-step validation ensures that the learning media is ready for use by both beginners and general users.

3. Results and Discussion

This section presents the tangible results of developing an interactive 3D animation-based learning medium. It also discusses its effectiveness in conveying shortcut key material to novice users. The process follows the final stages of the Multimedia Development Life Cycle (MDLC) method, namely assembly, testing, and distribution. These stages result in an animated video that has undergone visual, audio, and educational content refinement. The produced media shows simulations of shortcut key usage with 3D animation visualizing the actual position and movement of the keys. For example, when the Ctrl + C shortcut is pressed, the animation displays a finger pressing the corresponding keys, accompanied by a click sound and the word “Copy” appearing on the monitor. The animation was created using a 3D keyboard model in Blender, designed according to the standard ANSI 104-key layout, and edited using CapCut. The resulting .mp4 video was tested on various devices and by novice users.

Testing was conducted in two stages: internal testing and initial external testing. Internal testing ensured that all media elements functioned correctly — including animation playback, audio-text synchronization, and basic navigation. External testing involved target audience users, namely beginners in computer use. They were asked to watch the learning video and provide feedback on readability, material understanding, visual comfort, and animation appeal.

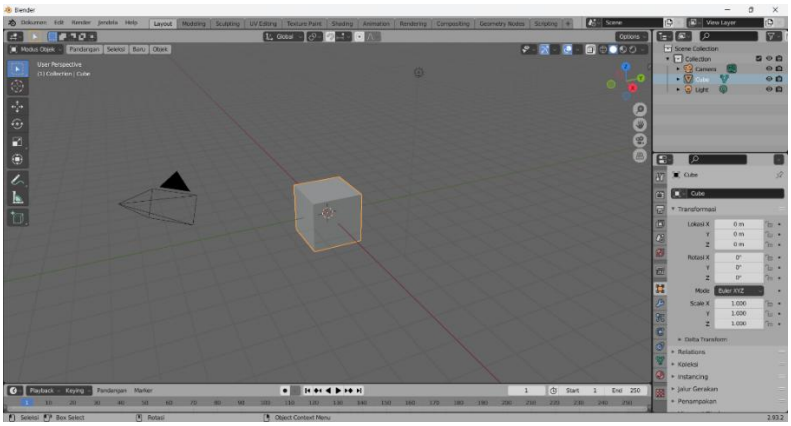

Fig. 3. Initial Display of the Learning Media

Fig. 3 shows the initial display of the developed keyboard shortcut learning media. This initial view provides the first impression for users before starting the animation simulation.

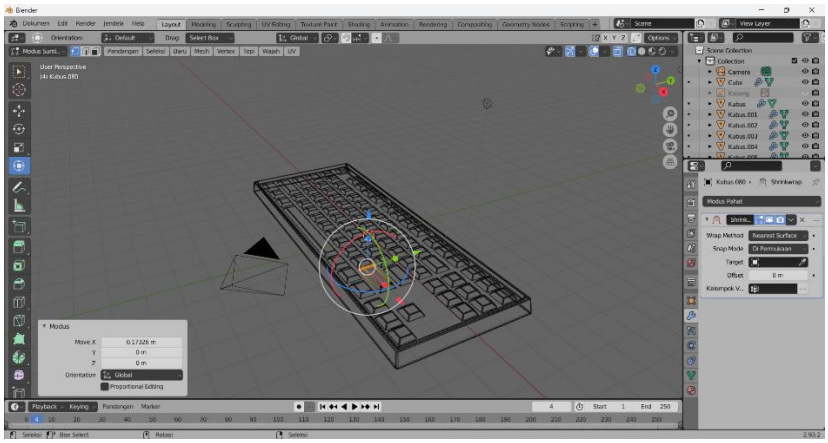

Fig. 4. Initial Keyboard Design in Blender

Fig. 4 shows the initial keyboard design created using the Blender application. This stage was carried out to create a keyboard model that resembles the actual shape.

After completing the initial design, the next step focused on testing the user experience by running the animation and gathering user reactions.

During the initial trial, users watched the entire animation with a duration of about 3 to 5 minutes. The media is structured as a linear video, allowing users to watch each shortcut simulation from start to finish without navigating themselves. Although not yet fully interactive, users can still perform basic navigation such as pausing, rewinding, or fast-forwarding certain parts. In practice, users with low digital literacy could easily follow the animation flow. They showed high enthusiasm due to its realistic visuals and supporting narration. This passive interaction proved effective for initial understanding of shortcuts, especially for those who had never learned the material before.

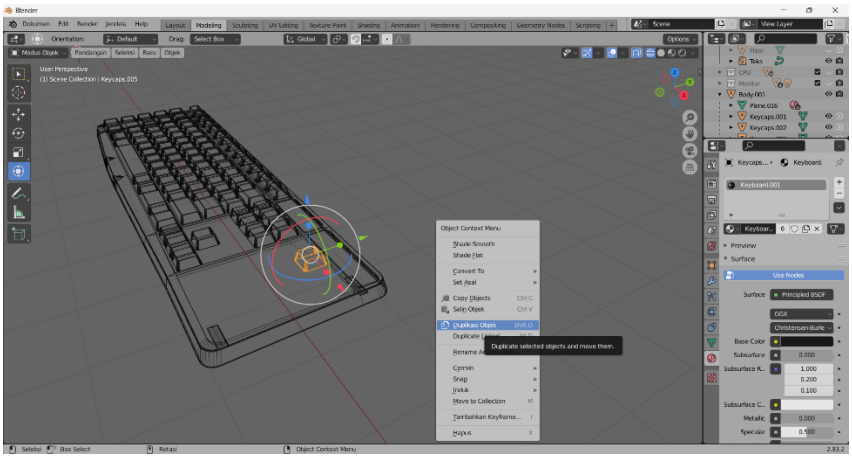

Fig. 5. Keyboard Modelling Process in Blender

Fig. 5 illustrates the detailed keyboard modelling process in Blender. This process includes shaping, placing the keys, and adjusting the proportions. This modelling process is crucial to ensure that each key matches its real-life counterpart, which helps in visualizing the shortcut functions clearly.

Functionality testing was carried out using the black-box method, where all animated shortcut keys were examined one by one to ensure that when a key is pressed, the animation shows the correct result. The results confirmed that all visualized shortcuts — such as Ctrl + C, Ctrl + V, Ctrl + Z, Ctrl + S, and Alt + Tab — functioned and displayed as planned (Teknik & Informatika, 2016).

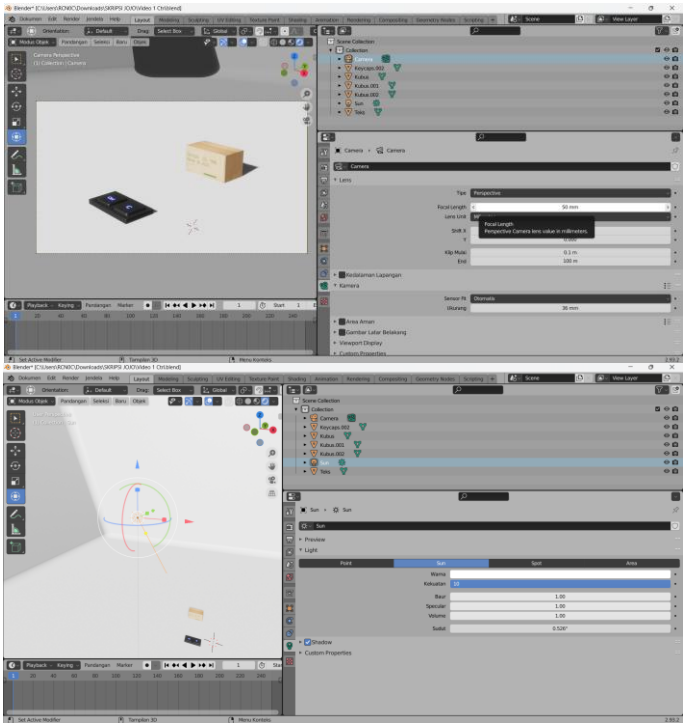

Fig. 6. Camera and Lighting Setup

Fig. 6 shows the camera and lighting setup used to ensure that the rendered animation appears realistic. Proper camera angles and lighting are essential for producing high-quality visual output. These factors make the animation more engaging for users. User perception testing yielded positive responses regarding the media's visual quality. Users commented that the 3D keyboard display looked very similar to a real keyboard. The added audio and text made explanations clearer. Most users said they could more easily remember key combinations after watching the animation compared to reading plain text. This aligns with Hendra et al. (2023), who stated that combining visuals and audio significantly enhances learning absorption.

Compared to conventional learning media such as textbooks, PowerPoint slides, or standard video tutorials, this interactive 3D animation has significant advantages. Conventional media tend to be one-way and visually less attractive, especially for younger learners or those with a visual-kinaesthetic learning style. In contrast, 3D animation allows users to see realistic simulations of key movements, action sequences, and results on screen. This approach bridges abstract concepts into easily understood forms. Farezi et al (2025) emphasized that visual and contextual material presentation is far more effective for technical learning like shortcut use, as users do not just memorize but also understand the context.

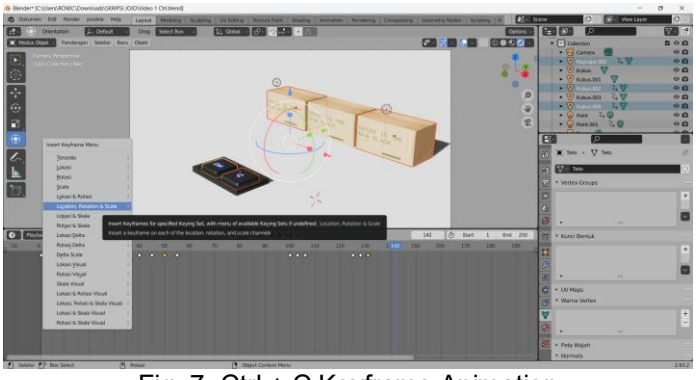

Fig. 7. Ctrl + C Keyframe Animation

Fig. 7 shows the keyframe animation for the Ctrl + C key. This stage demonstrates how the key press animation is created using keyframes on Blender's timeline. Keyframe settings define the flow of the shortcut action, ensuring smooth and accurate visual representation. This media is also highly beneficial for self-study. Compared to manuals or standard tutorials, the animation provides a more engaging learning experience through movement simulation and contextual shortcut usage. This advantage aligns with Kamil, Sindunigrum, dan Iqbal (2024), who stated that 3D animation-based media not only aids understanding but also boosts learning motivation. With a simple yet effective visual design, this media is suitable for various learning scenarios, such as basic computer training, ICT subjects in secondary schools, or self-paced courses.

Despite its benefits, some limitations should be noted. One is that the media is still a linear video. It does not yet allow users to select shortcuts interactively based on their needs. Additionally, it lacks quizzes or direct learning assessments to measure user comprehension after watching. Another limitation is its dependence on device quality: high-quality animations may not perform optimally on low-resolution screens or slow connections. However, these limitations can be addressed in future developments, for example, by creating a web-based application version or adding educational mini-game features. Final evaluation shows that this media is feasible as an alternative tool for teaching computer shortcut material. Although tested in a limited scope, user feedback provides initial evidence that interactive 3D animation has a positive impact on comprehension and learner engagement. This serves as a foundation for further development, such as adding app-based interactivity, evaluative quizzes, and integration with online learning platforms.

In addition to formal learning contexts like schools or basic computer training, this media also has great potential for other scenarios, such as employee onboarding, digital literacy content for the general public, or even as educational promotional material on social media. Given that computer shortcut mastery is now part of essential work skills, this media can help accelerate technology adaptation for new workers. It is especially useful in administration, design, or data processing fields. If developed in multiple language versions and subtitles, this media could reach a broader audience, opening opportunities for collaboration with training institutions, government agencies, or digital learning platforms to expand its national impact. Therefore, the interactive 3D animation-based keyboard shortcut learning media developed using the MDLC approach has successfully passed systematic development, technical and perception testing, and is deemed feasible for use in basic computer learning contexts. This product is expected to serve as a model or inspiration for developing similar educational media in other information technology areas.

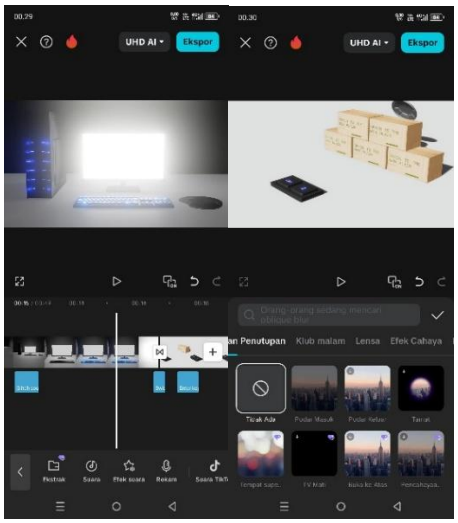

Fig. 8. Editing Process in the CapCut Application

Fig. 8 displays the editing process of the animation video in the CapCut application. This stage is used to add sound effects, text, and narration to make the animation more informative. After the editing stage, the final product was tested internally to ensure that all scenes, audio, and shortcut animations functioned properly and met the intended learning objectives. The detailed test results are shown in Table 2.

Table 2. Results of Animation Media Testing

No	Aspect Tested	Status	Notes
1	Clarity of shortcut animation	Works well	All keys are clearly visible and move according to the narration
2	Relevance of material and visuals	Appropriate	Text explanations match the movements in the animation
3	Visual and audio quality	Quite good	Animation runs smoothly, narration and text are readable
4	Animation sequence	Consistent flow	No scenes are skipped or cut off
5	User response (feedback)	Positive	Most users say the media is attractive and easy to follow

Based on the testing results, it can be concluded that the developed interactive 3D animation media works as expected and can effectively support the learning process on keyboard shortcut functions.

4. Conclusion

Based on the research results and discussion, it can be concluded that the interactive 3D animation-based learning medium developed using the Multimedia Development Life Cycle (MDLC) method is effective. It successfully conveys material about computer shortcut key functions. This medium combines a 3D keyboard visual, command simulations, and supporting audio narration. These features significantly help users, especially beginners, remember important shortcuts commonly used in daily activities. As Apriansyah (2020) stated, animation in learning can increase engagement and facilitate understanding by transforming abstract concepts into concrete visuals. Internal testing using the black-box method showed that all shortcut functions work well. User perception testing indicated improved understanding and increased interest in learning compared to conventional methods. This is also emphasized by Hendra dan Putra (2023) and Kamil, Sindunigrum, & Iqbal (2024), who discussed the effectiveness of interactive media in ICT learning. However, this media still has limitations, such as the lack of interactive evaluation features or self-assessment systems. Therefore, further development is needed. Suggestions for improvement include adding interactive navigation, evaluation quizzes, and integration with e-learning platforms. Development in multiple language formats and digital distribution could also broaden its impact. This is supported by Novita & Harahap (2020), who stated that animation-based media can positively affect motivation and learning outcomes in information technology fields. In line with this, future research should consider developing more advanced interactive features and implementing wider user testing to enhance the effectiveness and reach of this learning medium. This product is expected to serve as a model or inspiration for developing similar educational media in other information technology areas.

KEFAHAMAN FIQH HAID DALAM KALANGAN REMAJA DEWASA : KAJIAN KES TERHADAP PELAJAR PEREMPUAN KOLEJ KOMUNITI

Nor Haizam Md Warap*, Nurul Nadiah Tukirin, Norhidayah Md Saleh

Kolej Komuniti Kluang, 86000 Kluang, Johor, Malaysia

*Alamat e-mel penulis: haizam.warap@kkkluang.edu.my

Abstrak

Kajian ini dijalankan bagi menilai tahap kefahaman dan amalan pelajar perempuan Kolej Komuniti terhadap fiqh haid dan istihadhah, di samping mengenal pasti sumber ilmu yang mempengaruhi pemahaman mereka. Menggunakan kaedah soal selidik berstruktur berdasarkan skala Likert lima mata, seramai 56 orang responden bagi tiga buah Kolej Komuniti negeri Johor daripada pelbagai semester pengajian telah terlibat. Dapatan menunjukkan bahawa kefahaman asas mengenai haid berada pada tahap memuaskan, namun masih terdapat kekeliruan dalam aspek istihadhah, pengiraan tempoh suci dan haid, serta perbezaan antara jenis darah wanita. Amalan ibadah yang berkaitan pula menunjukkan tahap pematuhan yang tinggi, tetapi penggunaan teknologi seperti aplikasi untuk merekod kitaran haid masih belum meluas. Sumber ilmu yang dikenal pasti merangkumi pendidikan formal, ceramah dalam talian dan media sosial, namun tidak semua pelajar menerima bimbingan secara konsisten. Sehubungan itu, dicadangkan agar pendekatan pengajaran fiqh haid ditambah baik dengan kaedah lebih interaktif serta kurikulum yang lebih tersusun, bersesuaian dengan latar belakang teknikal pelajar Kolej Komuniti.
Kata kunci: Fiqh haid; Istihadhah; Pelajar Kolej Komuniti.

1. Pengenalan

Haid ialah darah yang keluar dari rahim wanita, bukan kerana melahirkan, dan berlaku secara kebiasaan pada waktu tertentu sebagai fitrah semula jadi wanita (Abd Karim Zaidan, 1997). Dalam satu hadis, Rasulullah S.A.W. bersabda kepada Aisyah r.a. ketika beliau didatangi haid: “Sesungguhnya ini adalah sesuatu yang telah Allah tetapkan ke atas anak-anak perempuan Adam” (al-Bukhari, no. 294; Muslim, no. 301). Dalam fiqh Islam, sifat, warna, dan masa keluarnya darah menjadi asas penting dalam menentukan hukum-hakam berkaitan ibadah seperti solat, puasa dan thaharah. Umur minimum wanita yang boleh mengalami haid adalah sekitar sembilan tahun qamariah dan warnanya hitam, panas, terasa sakit dan berbau busuk (al-Zuhaili, 1997). Tempoh haid kebiasaannya adalah 6-7 hari, dengan tempoh minimum adalah semalaman (24 jam), dan tempoh maksimumnya adalah 15 hari 15 malam (Liyana & Fatin, 2023). Dari sisi pendapat ulama’ Imam As-Syafie, warna darah haid boleh jadi hitam, merah, coklat, kuning dan keruh (al-Zuhaili, 1997). Penting disini, wanita yang sedang kedatangan haid adalah dilarang mengerjakan ibadah tertentu seperti solat, berpuasa, masuk masjid, membaca dan menyentuh al-Quran, dan mengerjakan tawaf juga melakukan hubungan suami isteri. Oleh itu, pemahaman terhadap kitaran haid amat penting dalam menentukan kesahihan ibadah seorang Muslimah.

Istihadhah merujuk kepada darah yang keluar dari pangkal rahim di luar waktu kebiasaan haid, lazimnya berpunca daripada masalah kesihatan atau gangguan pada bahagian pangkal rahim (al-Zuhaili, 1997). Ianya terjadi selepas habis tempoh maksimum haid iaitu 15 hari dan juga disebut darah penyakit. Berbeza dengan darah haid, istihadah tidak menghalang daripada melakukan ibadah seperti solat dan puasa. Hukum-hakam ibadah bagi wanita yang mengalami istihadhah adalah sama seperti wanita dalam keadaan suci, termasuk dibenarkan melakukan hubungan suami isteri (Ismail et al., 2016).

Segolongan remaja masih keliru membezakan antara darah haid dan istihadhah, serta tidak jelas mengenai pengiraan tempoh darah haid dan tempoh suci, yang akhirnya menjejaskan keyakinan mereka dalam menunaikan ibadah (Ismail et al., 2016). Kekeliruan ini lazimnya berpunca daripada kelemahan dalam memahami tanda fizikal haid, pengiraan tempoh suci, dan waktu sah ibadah. Dalam kalangan warga pendidik pula, turut dilaporkan mengalami kekeliruan dalam membezakan antara darah haid, nifas dan istihadhah, sekali gus menjejaskan keberkesanan penyampaian ilmu kepada pelajar (Khalid, Kadir, & Ahmad, 2022). Hal ini mungkin berpunca daripada kandungan silibus pendidikan formal yang terlalu umum, yang lebih menekankan aspek definisi semata-mata tanpa perincian mendalam terhadap hukum fiqh seperti pengiraan tempoh suci atau ciri darah. Kajian turut mendapati bahawa kandungan pengajaran fiqh darah wanita dalam silibus sedia ada masih terlalu ringkas dan tidak mencukupi, menyebabkan guru mencadangkan agar topik ini diajar lebih awal dengan sokongan program khas serta disediakan panduan mudah sebagai bahan rujukan pelajar (Salleh, Alqaraleh, & Kamaruddin, 2023). Oleh itu, pendekatan pendidikan yang lebih komprehensif dan interaktif sangat diperlukan bagi meningkatkan kefahaman dan keyakinan generasi muda Muslimah terhadap fiqh haid.

Dalam konteks kekeluargaan, jurang komunikasi antara ibu dan anak perempuan berkaitan isu haid sering mendorong remaja untuk mendapatkan maklumat daripada media sosial atau internet. Sumber ini tidak semestinya tepat dari sudut hukum fiqh, menyebabkan berlakunya kekeliruan dalam memahami peraturan ibadah semasa haid (Tengku Sarina Aini et al., 2024). Sementara itu, dapatan lain turut menunjukkan bahawa majoriti remaja perempuan tidak menerima pendidikan formal yang mencukupi daripada sekolah, ibu bapa, atau institusi agama. Sebaliknya, mereka lebih banyak bergantung kepada maklumat daripada rakan sebaya, media sosial atau pengalaman peribadi yang mungkin tidak lengkap dan kurang sahih (Chandra-Mouli & Patel, 2017).

Remaja khususnya pelajar perempuan Kolej Komuniti sedang melalui fasa penting dalam kehidupan yang melibatkan pembentukan identiti diri dalam masa yang sama mematuhi cara hidup bersyariat. Mereka juga berada dalam persekitaran TVET yang selalunya lebih menumpukan aspek kemahiran berbanding ilmu agama, termasuklah fiqh berkaitan wanita. Dapatan daripada penyelidikan terdahulu yang melibatkan pelajar Kolej Komuniti menunjukkan bahawa isu pengiraan haid yang tidak tetap sering menimbulkan kekeliruan dalam kalangan pelajar perempuan di institusi ini (Muhammad, Zakaria@Alias & Ibrahim, 2019). Kekurangan bimbingan formal dalam isu ini boleh menyebabkan salah faham dalam menentukan waktu sah beribadah, terutamanya ketika berlaku darah di luar waktu haid.

Kajian ini dilaksanakan bagi menilai sejauh mana pelajar perempuan di Kolej Komuniti memahami konsep haid dan istihadhah menurut perspektif hukum Islam. Di samping itu, ia bertujuan mengenal pasti sejauh mana ilmu tersebut diamalkan dalam kehidupan harian, khususnya dalam aspek pengurusan diri dan pelaksanaan ibadah semasa serta selepas haid. Turut diteliti ialah sumber-sumber utama yang dirujuk oleh para pelajar dalam memahami fiqh haid, sama ada melalui pendidikan formal, bimbingan tidak rasmi atau media. Keseluruhannya, penyelidikan ini berusaha memberikan gambaran menyeluruh terhadap tahap kefahaman, amalan rutin, dan keberkesanan sumber ilmu berkaitan hukum darah wanita dalam kalangan pelajar perempuan Kolej Komuniti. Dapatan kajian ini diharap dapat membantu membina bahan pengajaran atau pendekatan pengajaran dan pembelajaran yang perlu digunakan sesuai dengan latar belakang teknikal pelajar serta membuka ruang kepada penambahbaikan dalam kurikulum pendidikan Islam di institusi TVET.

2. Metodologi

Penyelidik telah membuat persampelan untuk kajian ke atas 100 orang pelajar siswi Kolej Komuniti di Johor. Dalam pengumpulan data penyelidik menggunakan beberapa kaedah pengumpulan data iaitu melalui borang soal selidik dan pengumpulan data

sekunder. Bagi kaedah soal selidik, penyelidik merangka soalan secara sistematik dan diberikan kepada responden. Kajian yang dilakukan ini melibatkan dua jenis sumber data iaitu data primer dan data sekunder. Data primer diperolehi daripada soal selidik yang diedarkan daripada responden, manakala data sekunder diperolehi melalui kajian perpustakaan dan pencarian data melalui internet seperti buku, jurnal dan artikel. Satu set borang soal selidik telah dibentuk berdasarkan sumber rujukan yang telah diperolehi.

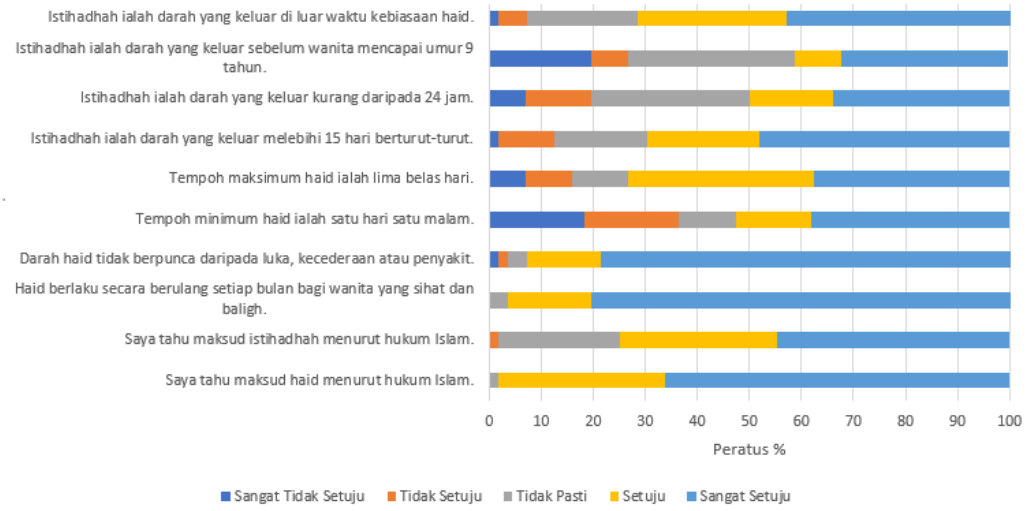
Kajian ini melibatkan seramai 56 orang pelajar perempuan daripada tiga buah Kolej Komuniti di negeri Johor yang dipilih menggunakan kaedah persampelan bertujuan (*purposive sampling*). Pemilihan responden dibuat berdasarkan kriteria pelajar perempuan beragama Islam yang telah mencapai usia baligh, sedang mengikuti pengajian di peringkat sijil, serta mempunyai latar belakang pengajian dalam subjek berkaitan Pendidikan Islam. Pengumpulan data dijalankan melalui dua kaedah utama iaitu soal selidik berstruktur dan data sekunder. Soal selidik telah dibina secara sistematik berdasarkan sorotan kajian terdahulu dan diedarkan kepada semua responden, manakala data sekunder diperoleh melalui rujukan buku, jurnal dan artikel ilmiah secara dalam talian bagi menyokong dan memperkukuh dapatan kajian.

Instrumen kajian terdiri daripada soal selidik berstruktur yang dibangunkan berdasarkan tema utama kajian. Soal selidik ini mengandungi empat bahagian utama, iaitu pengetahuan asas haid dan istihadhah, pengetahuan dan keyakinan terhadap tempoh suci dan tempoh haid, amalan fiqh berkaitan haid dalam ibadah, dan sumber ilmu dan pendidikan fiqh haid. Semua item disusun dalam bentuk skala Likert lima mata. Bagi memastikan kesahan kandungan (*content validity*), soal selidik telah disemak oleh dua orang pensyarah Pendidikan Islam. Ujian kebolehpercayaan (*reliability test*) pula telah dijalankan melalui ujian rintis ke atas pelajar luar sampel utama, dan nilai Cronbach's Alpha sebanyak 0.82 diperoleh, menunjukkan tahap kebolehpercayaan yang tinggi dan konsisten (Fraenkel, Wallen & Hyun, 2012).

3. Dapatan dan Perbincangan

Demografi menunjukkan bahawa seramai 56 orang responden terlibat dalam kajian ini, terdiri daripada pelajar perempuan Kolej Komuniti yang berada di pelbagai semester pengajian. Sebahagian besar responden merupakan pelajar semester 2 (33.9%), diikuti oleh semester 4 iaitu pelajar yang sedang menjalani latihan industri (30.4%), semester 1 (21.4%) dan semester 3 (14.3%). Taburan ini membolehkan dapatan kajian melihat kefahaman fiqh haid dari pelbagai tahap pengajian.

Dari segi pendedahan terhadap ilmu fiqh wanita, majoriti responden iaitu 64.3% menyatakan mereka pernah menghadiri kelas, kuliah atau bengkel berkaitan haid. Walau bagaimanapun, masih terdapat 35.7% yang belum pernah mendapat pendedahan secara formal dalam topik tersebut. Merujuk kepada Ini menunjukkan bahawa meskipun ada usaha untuk memberikan ilmu berkaitan fiqh wanita, pendekatan sedia ada masih belum menyeluruh. Maka, ruang untuk memperluas pendidikan fiqh haid dalam kalangan pelajar Kolej Komuniti masih perlu diberi perhatian.

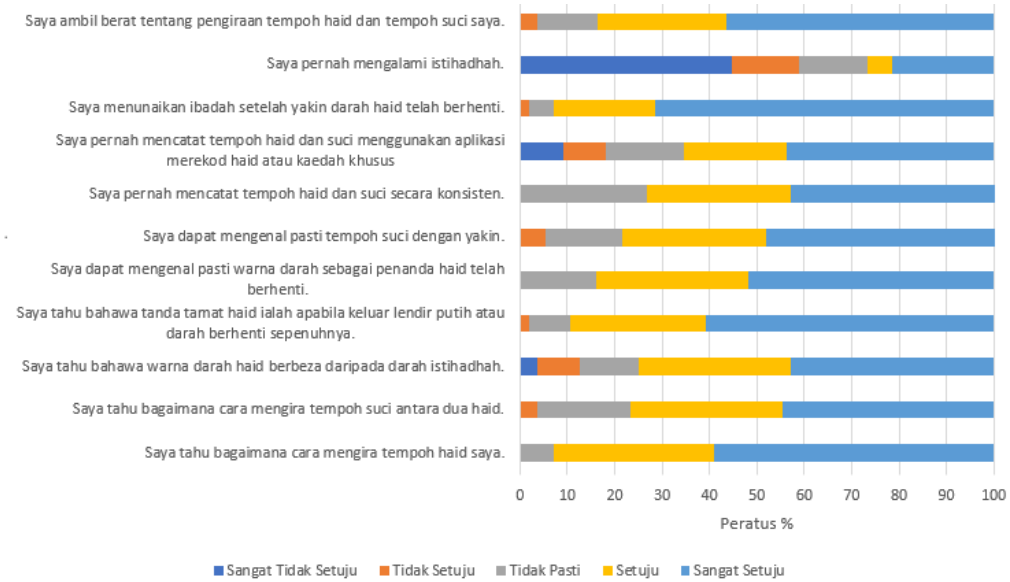


Rajah 2. Pengetahuan Asas Haid dan Istihadhah

Analisis menunjukkan bahawa pelajar mempunyai tahap kefahaman yang baik terhadap konsep asas haid, khususnya dalam aspek definisi dan kitaran. Item *"Saya tahu maksud haid menurut hukum Islam"* mencatat min 4.52, manakala *"Haid berlaku secara bulanan bagi wanita yang sihat"* mencatat min 4.47, dengan lebih 80% pelajar menjawab "Setuju" atau "Sangat Setuju". Ini menggambarkan penguasaan yang kukuh dalam memahami haid sebagai salah satu komponen asas fiqh wanita.

Namun begitu, apabila menyentuh isu berkaitan istihadhah, tahap kefahaman pelajar menurun dengan ketara. Item *"Saya tahu maksud istihadhah menurut hukum Islam"* hanya mencatat min 3.63, dan lebih 36.3% pelajar memberikan respon "Tidak Setuju" atau "Tidak Pasti". Kekeliruan ini lebih jelas dalam item seperti *"Istihadhah ialah darah yang keluar kurang daripada 24 jam"* (gabungan respon negatif 54.5%) dan *"Istihadhah berlaku apabila darah keluar melebihi 15 hari berturut-turut"* (gabungan respon negatif 50%). Statistik ini menunjukkan bahawa meskipun pelajar memahami teori asas haid, mereka masih belum benar-benar menguasai perbezaan antara darah haid dan istihadhah dimana ianya satu perkara yang memberi kesan besar terhadap pelaksanaan ibadah seperti solat dan puasa.

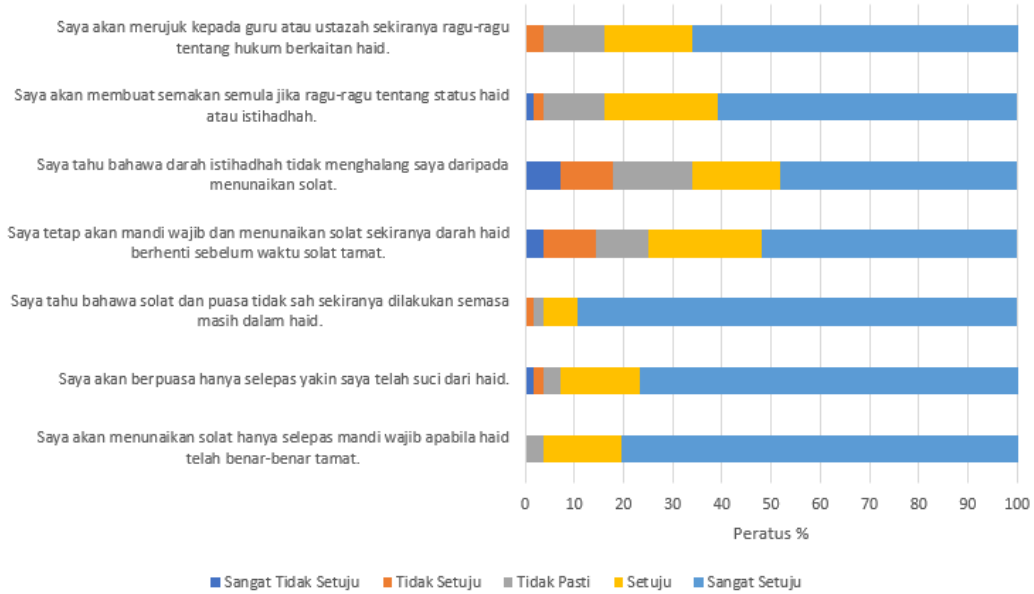
Dalam fiqh, perbezaan antara darah haid dan istihadhah amat penting kerana wanita yang mengalami istihadhah masih diwajibkan menunaikan solat dan puasa seperti biasa, dengan syarat bersuci bagi setiap waktu solat (al-Zuhaili, 1997). Kekeliruan ini turut disokong oleh dapatan kajian Ismail et al. (2016) yang menyatakan bahawa kurangnya penerangan terperinci dan bimbingan praktikal dalam pengajaran menjadi punca utama kelemahan. Maka, pengajaran fiqh wanita wajar ditambah baik melalui pendekatan lebih interaktif agar kefahaman pelajar dapat diperkukuh dengan lebih berkesan.



Rajah 2. Pengetahuan dan Keyakinan Terhadap Tempoh Suci dan Tempoh Haid

Data menunjukkan bahawa pelajar mempunyai pengetahuan yang baik terhadap asas fiqh haid, terutamanya dalam aspek pengiraan tempoh haid (min = 4.36) dan tanda-tanda fizikal tamat haid seperti keluarnya lendir putih atau darah berhenti sepenuhnya (min = 4.38). Peratusan tinggi respon “Setuju” dan “Sangat Setuju” melebihi 75% bagi item-item ini mencerminkan tahap kesedaran yang positif dan penguasaan konsep asas yang memuaskan dalam kalangan pelajar. Ini menunjukkan bahawa maklumat asas fiqh haid telah sampai dan difahami dengan baik secara umum.

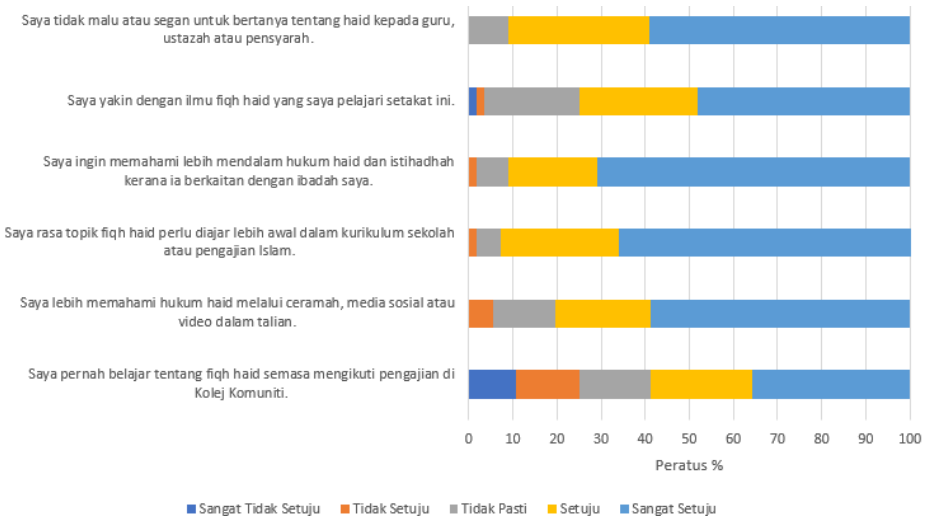
Namun begitu, tahap kepatuhan terhadap pelaksanaan amalan berkaitan seperti pencatatan tempoh haid secara konsisten atau penggunaan aplikasi rekod haid masih sederhana, dengan min sekitar 3.70 hingga 3.82 dan respon “Tidak Pasti” serta “Tidak Setuju” yang masih ketara. Kekeliruan turut dikenal pasti dalam aspek istihadhah, terutamanya dalam memahami perbezaan warna darah atau ciri-ciri darah istihadhah, yang boleh memberi kesan kepada kesahihan ibadah. Maka, pengajaran fiqh wanita disarankan agar diperkukuh dengan latihan pengiraan, panduan visual dan pendekatan interaktif agar pelajar dapat mengurus ibadah mereka dengan lebih yakin dan tepat (Ismail et al., 2016; Salleh et al., 2023).



Rajah 3. Amalan Fiqh Berkaitan Haid Dalam Ibadah

Didapati masih terdapat kekeliruan yang ketara dalam kalangan pelajar terhadap hukum darah istihadhah, khususnya berkaitan pelaksanaan solat. Item “Saya tahu bahawa darah istihadhah tidak menghalang saya daripada menunaikan solat” mencatat nilai min serendah 3.63, manakala hampir 50% responden berada pada kategori “Tidak Pasti” dan “Tidak Setuju”, menunjukkan tahap kefahaman yang lemah dalam kalangan pelajar. Ini menunjukkan bahawa separuh daripada responden masih belum jelas bahawa wanita yang mengalami istihadhah tetap diwajibkan menunaikan solat seperti biasa setelah membersihkan diri dan mengambil wuduk bagi setiap waktu solat (Liyana et al., 2023).

Kekeliruan ini memberi implikasi besar kerana ia boleh menyebabkan pelajar meninggalkan solat secara tidak sengaja akibat salah faham terhadap hukum. Keadaan ini menuntut agar aspek fiqh istihadhah diberikan penekanan lebih besar dalam pengajaran, terutamanya dengan pendekatan seperti latihan kes, panduan visual dan situasi simulasi. Pengukuhan ilmu dalam topik ini amat penting bagi memastikan pelajar dapat menunaikan ibadah dengan yakin, sah, dan tidak terbeban dengan kekeliruan hukum.



Rajah 4. Sumber Ilmu dan Pendidikan Fiqh Haid

Majoriti responden menunjukkan tahap keterbukaan dan keyakinan yang tinggi terhadap ilmu fiqh haid. Mereka tidak malu untuk bertanya kepada guru atau pensyarah, dan menunjukkan keyakinan terhadap ilmu yang telah dipelajari. Selain itu, sebahagian besar responden menyatakan keinginan untuk memahami lebih mendalam berkaitan hukum haid dan istihadhah kerana ia memberi kesan langsung terhadap kesempurnaan ibadah. Keperluan ini selaras dengan dapatan yang mencadangkan agar panduan fiqh wanita disediakan dalam bentuk yang lebih praktikal dan mudah diakses (Salleh et al., 2023).

Responden juga bersetuju bahawa topik fiqh haid wajar diperkenalkan lebih awal dalam sistem pendidikan Islam formal, agar pelajar dapat membina asas kefahaman yang kukuh sejak peringkat awal. Tambahan pula, sumber ilmu seperti ceramah, media sosial, dan video dalam talian didapati memainkan peranan penting dalam membina kefahaman mereka, namun masih terdapat sebahagian pelajar yang tidak pernah menerima pengajaran formal berkaitan topik ini di Kolej Komuniti. Keadaan ini menegaskan keperluan memperkukuh pendekatan pendidikan fiqh haid melalui pelbagai saluran dan peringkat pendidikan (Ismail et al., 2016).

4. Kesimpulan

Kajian ini menunjukkan bahawa tahap kefahaman pelajar perempuan Kolej Komuniti terhadap fiqh haid dan istihadhah masih berada pada tahap sederhana. Kefahaman berkaitan asas haid didapati lebih baik berbanding kefahaman terhadap istihadhah yang masih mengelirukan sebahagian responden. Dari segi amalan, majoriti pelajar menunjukkan pematuhan yang baik dalam ibadah berkaitan haid, namun kekeliruan tetap wujud terutama dalam aspek pengiraan tempoh haid dan suci serta perbezaan antara darah haid dan darah istihadhah, secara langsung ianya boleh menjejaskan pelaksanaan ibadah harian. Sumber rujukan ilmu yang digunakan juga pelbagai, termasuk pendidikan formal, media sosial dan ceramah dalam talian, namun tidak semua pelajar mendapat bimbingan secara sistematik dan menyeluruh.

Dapatan ini memberi implikasi penting terhadap pembangunan kurikulum Pendidikan Islam di Kolej Komuniti, khususnya dalam memastikan topik fiqh wanita disampaikan dengan lebih menyeluruh, interaktif dan bersesuaian dengan keperluan pelajar dari aliran teknikal dan vokasional. Justeru, pendekatan pengajaran perlu diperkukuh dengan elemen latihan praktikal, panduan visual, dan penggunaan teknologi yang mesra pengguna. Bagi mengukuhkan kefahaman dan keyakinan pelajar terhadap fiqh haid dan istihadhah, disarankan agar satu modul pengajaran berasaskan simulasi kehidupan sebenar dibangunkan, merangkumi aktiviti seperti latihan pengiraan tempoh haid dan istihadhah, senario interaktif berkaitan, serta penggunaan aplikasi digital pencatat kitaran haid yang disesuaikan dengan prinsip fiqh.

Sebagai cadangan lanjutan, satu kajian kuasi-eksperimen boleh dilaksanakan bagi menilai keberkesanan modul tersebut dengan membandingkan tahap kefahaman pelajar sebelum dan selepas intervensi. Selain itu, skop kajian boleh diperluaskan ke institusi TVET lain seperti politeknik dan kolej vokasional di seluruh negara bagi mendapatkan gambaran yang lebih menyeluruh. Dapatan ini berpotensi menyumbang kepada pembangunan kurikulum Pendidikan Islam yang lebih kontekstual, praktikal, dan sejajar dengan realiti serta keperluan pelajar masa kini.

Abstrak

Kajian ini dijalankan bagi menilai pandangan pelajar terhadap kebolehlaksanaan dan keperluan pelaksanaan program Tahfiz al-Quran di Politeknik Port Dickson. Penelitian ini memberi tumpuan kepada potensi pelaksanaan program dari aspek penerimaan pelajar, kesesuaian persekitaran pembelajaran serta manfaat yang dijangka memberi impak kepada pembangunan sahsiah, pencapaian akademik dan kesejahteraan mental pelajar. Kajian ini menggunakan reka bentuk tinjauan dengan kaedah pengumpulan data melalui edaran borang soal selidik kepada pelajar sebagai responden utama. Dapatan menunjukkan majoriti pelajar menyambut baik cadangan pelaksanaan program ini kerana diyakini mampu memperkukuh jati diri dan kerohanian, membentuk disiplin diri yang tinggi serta menyumbang kepada peningkatan prestasi akademik. Walau bagaimanapun, beberapa cabaran turut dikenalpasti seperti kekangan masa, jadual akademik yang padat serta kekurangan tenaga pengajar yang berkemahiran dalam bidang hafazan. Oleh itu, kajian mencadangkan agar pendekatan strategik seperti penyesuaian jadual, penggunaan modul fleksibel, serta sokongan padu daripada pihak pengurusan institusi diterapkan bagi memastikan pelaksanaan yang berkesan. Secara keseluruhannya, kajian ini memberikan gambaran awal tentang kesediaan pelajar terhadap pelaksanaan program dan boleh dijadikan rujukan dalam perancangan serta pembangunan program tahfiz yang bersesuaian di institusi pendidikan teknikal dan vokasional. Implikasinya juga melibatkan usaha melahirkan modal insan yang seimbang dari segi ilmu pengetahuan, kemahiran dan nilai akhlak yang tinggi.
Kata kunci: Program Tahfiz; Kebolehlaksanaan; Keperluan.

1. Pengenalan

Pendidikan teknikal dan vokasional (TVET) di Malaysia telah mengalami perkembangan pesat bagi memenuhi keperluan tenaga kerja yang kompeten dalam pelbagai industri (Mustapha & Abdullah, 2020). Perubahan landskap ekonomi dan teknologi menuntut institusi TVET untuk menyediakan graduan yang bukan sahaja mahir dalam aspek teknikal tetapi juga memiliki nilai sahsiah yang tinggi (Mohamad et al., 2018). Politeknik, sebagai salah satu institusi pendidikan tinggi yang menawarkan program TVET, memainkan peranan penting dalam membangunkan modal insan yang bukan sahaja kompeten dalam kemahiran teknikal tetapi juga mempunyai keperibadian unggul serta jati diri yang kukuh (Zainal & Ismail, 2021).

Dalam era globalisasi dan cabaran semasa, pembangunan pelajar tidak boleh hanya berfokus kepada kemahiran teknikal dan akademik semata-mata. Unsur pendidikan holistik yang merangkumi aspek kerohanian dan pembentukan akhlak perlu diberi perhatian dalam sistem pendidikan (Rahman et al., 2019). Salah satu pendekatan yang boleh diterapkan dalam sistem TVET adalah dengan mengintegrasikan program tahfiz al-Quran sebagai sebahagian daripada kurikulum atau aktiviti tambahan. Pendidikan berasaskan al-Quran bukan sahaja memberi manfaat dalam aspek keagamaan tetapi juga berperanan membentuk individu yang berdisiplin, beretika, dan mempunyai daya tahan tinggi dalam menghadapi cabaran kehidupan serta kerjaya (Hamzah et al., 2022).

Pelaksanaan program tahfiz di sekolah-sekolah agama dan institusi pengajian tinggi Islam telah terbukti mampu melahirkan individu yang bukan sahaja mahir dalam penghafalan al-Quran tetapi juga cemerlang dalam bidang akademik dan profesional (Ismail & Hassan, 2020). Walau bagaimanapun, di peringkat politeknik, pelaksanaan program tahfiz masih merupakan pendekatan yang baharu dan belum diterokai secara meluas. Kesenjangan ini penting untuk dikaji kerana politeknik menekankan pendidikan teknikal, manakala integrasi program tahfiz berpotensi memperkukuh pembangunan sahsiah pelajar. Justeru, kajian ini perlu dijalankan bagi menilai tahap kesediaan, penerimaan, dan persepsi pelajar terhadap pendekatan baharu ini (Roslan et al., 2021).

Integrasi program tahfiz di politeknik berpotensi menyumbang kepada pembentukan sahsiah pelajar yang lebih holistik. Menurut Alwi dan Sulaiman (2019), amalan menghafal al-Quran dapat meningkatkan daya ingatan, ketekunan, serta memberi ketenangan jiwa kepada individu, sekali gus membantu pelajar mengurus tekanan akademik dengan lebih baik. Sementara itu, kajian oleh Zakaria dan Yusof (2023) membuktikan bahawa hafazan melatih kemahiran fokus, disiplin, dan daya tahan mental, yang boleh diaplikasikan secara langsung dalam pembelajaran teknikal dan vokasional. Manakala Ariffin et al. (2020) pula menekankan bahawa program tahfiz memberikan peluang kepada pelajar untuk mengukuhkan kefahaman agama sambil mempersiapkan diri menghadapi cabaran dunia pekerjaan.

Selain itu, nilai-nilai Islam yang diterapkan melalui program tahfiz dapat menjadi panduan pelajar dalam membuat keputusan yang beretika dan bertanggungjawab (Rahman & Aziz, 2019), serta membantu membentuk budaya kerja positif dan harmoni (Yahya et al., 2022). Walaupun pelaksanaan program tahfiz al-Quran telah terbukti memberi impak positif terhadap pembentukan sahsiah, prestasi akademik, dan kesejahteraan mental pelajar (Ismail & Hassan, 2020; Alwi & Sulaiman, 2019), pelaksanaannya di politeknik masih baharu. Kajian oleh Ariffin dan Sulaiman (2022) menunjukkan bahawa integrasi tahfiz dalam pendidikan vokasional dapat mengukuhkan disiplin diri, fokus pembelajaran, dan motivasi pelajar. Namun, sebelum dapat dilaksanakan secara menyeluruh, beberapa cabaran perlu ditangani, termasuk kesesuaian jadual akademik dan latihan industri dengan waktu hafazan (Salleh & Omar, 2021), kekurangan tenaga pengajar berkelayakan (Zakaria, 2021), serta perbezaan tahap penerimaan pelajar mengikut latar belakang akademik (Mahmud & Zulkifli, 2021). Tambahan pula, Iskandar et al. (2020) mendapati bahawa kekangan masa dan beban akademik tinggi sering menjadi penghalang penglibatan pelajar dalam aktiviti kerohanian.

Oleh itu, kajian ini dijalankan untuk menilai kebolehlaksanaan dan keperluan program tahfiz di Politeknik Port Dickson dengan meneliti pandangan pelajar terhadap manfaat serta cabaran pelaksanaannya. Penelitian ini diharapkan dapat memberikan gambaran terperinci tentang kesesuaian program tahfiz dalam sistem pendidikan politeknik, strategi pelaksanaan terbaik, dan peranannya dalam melahirkan graduan TVET yang seimbang dari segi kemahiran teknikal, kekuatan spiritual, sahsiah yang tinggi, nilai keagamaan kukuh, serta keupayaan menjadi tenaga kerja berkualiti dalam industri dan masyarakat (Ibrahim et al., 2023; Kamaruddin & Hashim, 2020).

2. Metodologi

Kajian ini menggunakan pendekatan kuantitatif dengan kaedah tinjauan bagi mendapatkan maklumat mengenai tahap penerimaan pelajar terhadap kebolehlaksanaan dan keperluan program tahfiz al-Quran di Politeknik Port Dickson. Pendekatan ini dipilih kerana ia membolehkan pengumpulan data secara sistematik dan objektif, sekali gus menghasilkan dapatan yang boleh digeneralisasikan kepada populasi sasaran (Creswell, 2014).

Data dikumpulkan menggunakan borang soal selidik yang dibangunkan khas bagi memenuhi objektif kajian, merangkumi bahagian demografi, kebolehlaksanaan program, keperluan dan

manfaat, serta cabaran pelaksanaan. Data yang diperoleh dianalisis menggunakan perisian *Statistical Package for the Social Sciences* (SPSS) melalui analisis deskriptif seperti kekerapan, peratusan, dan skor min bagi mengenal pasti tahap penerimaan dan persepsi pelajar terhadap program tahfiz.

Populasi kajian terdiri daripada pelajar aktif di Politeknik Port Dickson yang mempunyai latar belakang dan pengalaman mengikuti pendidikan tahfiz. Kriteria ini dipilih bagi memastikan responden mempunyai pengetahuan asas hafazan dan kefahaman berkaitan al-Quran.

Sampel kajian dipilih menggunakan teknik persampelan bertujuan (*purposive sampling*), iaitu hanya melibatkan pelajar yang memenuhi kriteria latar belakang tersebut. Seramai 11 orang pelajar telah dikenal pasti dan dipilih sebagai responden kajian ini, mewakili pelbagai program pengajian di politeknik.

3. Dapatan dan Perbincangan

Bahagian A: Demografi responden
Kajian rintis ini dijalankan bagi meninjau pandangan pelajar terhadap kebolehlaksanaan dan keperluan pelaksanaan program Tahfiz al-Quran di Politeknik Port Dickson. Analisis berdasarkan data demografi dan latar belakang akademik responden dalam Jadual 1 memberikan gambaran awal yang signifikan terhadap potensi pelaksanaan program ini dalam institusi berasaskan pendidikan teknikal dan vokasional (TVET).

Daripada keseluruhan 11 responden, majoriti ialah pelajar lelaki, seramai 8 orang (72.7%), manakala pelajar perempuan seramai 3 orang (27.3%). Komposisi ini sejajar dengan trend penglibatan pelajar lelaki yang lebih tinggi dalam program kejuruteraan di politeknik. Justeru, pelaksanaan awal program tahfiz boleh memberi tumpuan kepada kumpulan pelajar lelaki tanpa mengabaikan penyertaan pelajar perempuan pada fasa seterusnya.

Kajian mendapati sebahagian besar responden (81.8%) berada dalam lingkungan umur 18 hingga 20 tahun, manakala selebihnya (18.2%) berumur antara 21 hingga 23 tahun. Tiada responden melebihi umur 23 tahun. Dapatan ini menunjukkan bahawa majoriti peserta merupakan pelajar semester awal yang masih berada dalam fasa penyesuaian diri dengan suasana pengajian tinggi. Oleh itu, memperkenalkan program pembinaan sahsiah dan spiritual seperti tahfiz al-Quran pada peringkat ini dianggap sesuai.

Responden terdiri daripada pelbagai program pengajian, terutamanya dalam bidang kejuruteraan seperti Diploma Kejuruteraan Awam (18.2%), Diploma Kejuruteraan Elektrik (18.2%) dan Diploma Kejuruteraan Elektrik (Tenaga Hijau & Kecekapan Tenaga) (27.3%). Selain itu, terdapat penyertaan daripada pelajar dalam bidang bukan teknikal seperti Diploma Sains Kesetiausahaan (27.3%). Hal ini menunjukkan bahawa minat terhadap penghafalan al-Quran merentasi bidang pengajian, sekali gus memperlihatkan potensi pelaksanaan program ini secara merentas jabatan.

Selain itu, majoriti responden (90.9%) berada di Semester 2, manakala hanya seorang responden (9.1%) berada di Semester 4. Tiada responden dari semester akhir atau latihan industri. Keadaan ini memperlihatkan bahawa pelajar semester awal lebih terbuka kepada penglibatan dalam aktiviti kokurikulum dan program pembentukan sahsiah. Maka, pelaksanaan program tahfiz di peringkat awal pengajian dianggap strategik dari segi masa dan kesediaan mental pelajar.

Kesemua responden (100%) mempunyai pengalaman menghafal al-Quran sebelum ini. Dapatan ini signifikan kerana ia membuktikan kewujudan kumpulan pelajar yang mempunyai asas kukuh dalam penghafalan al-Quran, dan mereka berpotensi untuk meneruskan atau menyempurnakan hafalan sedia ada. Keadaan ini menyokong keperluan institusi

menyediakan program khusus bagi menyambung kesinambungan minat dan amalan spiritual tersebut. Secara keseluruhannya, dapatan kajian rintis ini menunjukkan bahawa program tahfiz al-Quran mempunyai asas kukuh untuk dilaksanakan di Politeknik Port Dickson. Walaupun bilangan responden masih terhad, kesemua mereka menunjukkan minat, pengalaman, dan kesediaan untuk terlibat. Pelaksanaan program ini berpotensi memupuk kecemerlangan spiritual dalam kalangan pelajar TVET serta menyumbang kepada pembangunan sahsiah holistik selaras dengan aspirasi Falsafah Pendidikan Kebangsaan.

Bahagian B: Analisis Kebolehlaksanaan Program Tahfiz

Bahagian ini menilai persepsi pelajar terhadap kebolehlaksanaan pelaksanaan program Tahfiz al-Quran di Politeknik Port Dickson berdasarkan lima pernyataan utama di Jadual 2. Analisis dibuat menggunakan min, sisihan piawai (SP) dan tahap persepsi pelajar terhadap setiap pernyataan.

Bagi pernyataan “Program tahfiz boleh dilaksanakan di politeknik” memperoleh skor min 4.36 dan sisihan piawai (SP) 0.67, tahap tinggi. Sebanyak 45.5% responden bersetuju dan sangat bersetuju dengan kenyataan ini, menunjukkan keyakinan pelajar bahawa persekitaran politeknik sesuai untuk pelaksanaan program tahfiz. Ini juga mencerminkan kesediaan institusi dari segi budaya kampus serta keupayaan menyediakan sokongan logistik asas seperti ruang, peralatan, dan kemudahan pembelajaran yang sesuai.

Item “Program tahfiz tidak mengganggu jadual akademik saya” menerima skor min 3.73 dengan sisihan piawai (SP) 0.65 dan berada pada tahap sederhana. Walaupun majoriti responden (63.6%) bersetuju atau sangat bersetuju, terdapat 36.4% yang hanya kurang bersetuju. Kebimbangan ini mencerminkan keperluan kepada sesi dialog bersama pelajar untuk menjelaskan struktur program, penyesuaian jadual aktiviti, serta strategi pengurusan masa yang sesuai agar tidak menjejaskan prestasi akademik. Oleh itu, perancangan program perlulah mempertimbangkan jadual fleksibel atau pelaksanaan luar waktu kuliah.

Item “Program tahfiz perlu dijalankan secara fleksibel” mencatatkan min tertinggi iaitu 4.45 dengan sisihan piawai (SP) 0.52 dan berada pada tahap tinggi. Semua responden bersetuju atau sangat bersetuju bahawa fleksibiliti adalah aspek penting dalam pelaksanaan program tahfiz. Ini memberi isyarat jelas bahawa pendekatan program mesti adaptif, contohnya dengan menggunakan pendekatan modular, sesi dalam talian, atau waktu selepas kuliah.

Seterusnya, politeknik dilihat mempunyai tenaga pengajar yang mencukupi. Item ini memperoleh min 3.91 dan sisihan piawai (SP) 0.83, berada pada tahap sederhana. Walaupun majoriti (72.8%) memberikan maklum balas positif, kewujudan peratusan sederhana yang tidak begitu yakin (27.3%) menunjukkan bahawa masih ada keraguan tentang keupayaan institusi menyediakan tenaga pengajar mahir dalam bidang tahfiz. Justeru, kerjasama dengan institusi luar seperti pusat tahfiz atau Jabatan Agama Islam Negeri mungkin diperlukan.

Bagi pernyataan “Saya berminat untuk menyertai program tahfiz ini” menerima min 4.00 dan sisihan piawai (SP) 0.77, juga berada pada tahap tinggi. Dapatan ini menunjukkan minat yang kukuh dalam kalangan pelajar untuk menyertai program tahfiz sekiranya ia diperkenalkan. Minat ini merupakan petunjuk awal yang penting dalam memastikan penglibatan dan kelestarian program.

Jadual 1. Demografi Responden

		Kategori	Jumlah	Peratusan
1	Jantina	Lelaki	8	72.7%
		Perempuan	3	27.3%
2	Umur	18 Hingga 20 Tahun	9	81.8%
		21 Hingga 23 Tahun	2	18.2%
		24 Hingga 26 Tahun	0	0%
		27 Tahun Ke Atas	0	0%
3	Program Pengajian	Diploma Kejuruteraan Awam	2	18.2%
		Diploma Kejuruteraan Elektrik (Kecekapan Tenaga)	2	18.2%
		Diploma Kejuruteraan Elektrik (Tenaga Hijau)	1	9.1%
		Diploma Kejuruteraan Elektronik (Komputer)	2	18.2%
		Diploma Kejuruteraan Elektronik (Komunikasi)	0	0%
		Diploma Kejuruteraan Mekanikal	1	9.1%
		Diploma Kejuruteraan Mekanikal (Automotif)	0	0%
		Diploma Kejuruteraan Mekanikal (Pembuatan)	0	0%
		Diploma Kejuruteraan Mekatronik	0	0%
		Diploma Pemasaran	0	0%
		Diploma Perakaunan	0	0%
		Diploma Sains Kesetiausahaan	3	27.3%
		Diploma Seni Bina	0	0%
4	Semester Pengajian	Semester 1	0	0%
		Semester 2	10	90.9%
		Semester 3	0	0%
		Semester 4	1	9.1%
		Semester 5	0	0%
		Semester 6 (Latihan Industri)	0	0%
5	Adakah Anda Pernah Menghafal al-Quran Sebelum Ini?	Ya	11	100%
		Tidak	0	0%

Min keseluruhan bagi bahagian ini ialah 4.09 dengan sisihan piawai (SP) 0.69, menunjukkan tahap tinggi dari segi kebolehlaksanaan program tahfiz menurut perspektif pelajar. Pelaksanaan secara berskala kecil juga memberi ruang kepada pentadbiran institusi menilai impak awal terhadap pelajar, mengenal pasti cabaran pelaksanaan, serta membuat penambahbaikan sebelum program diperluaskan. Hasil ini menyokong cadangan bahawa program tahfiz boleh dimulakan secara berskala kecil dengan pendekatan yang fleksibel dan adaptif terhadap keperluan pelajar TVET. Pelaksanaan program tahfiz yang tidak rigid, menggunakan masa lapang, dan melibatkan fasilitator berpengalaman akan meningkatkan kadar keberhasilan serta penerimaan pelajar.

Jadual 2. Analisis Kebolehlaksanaan Program Tahfiz

BIL	PERNYATAAN	SKALA					MIN	SD	TAHAP
		1 STS	2 TS	3 KS	4 S	5 SS			
1	Program tahfiz boleh dilaksanakan di politeknik.	0% (0)	0% (0)	9.1% (1)	45.5% (5)	45.5% (5)	4.36	0.67	Tinggi
2	Program tahfiz tidak mengganggu jadual akademik saya.	0% (0)	0% (0)	36.4% (4)	54.5% (6)	9.1% (1)	3.73	0.65	Sederhana
3	Program tahfiz perlu dijalankan secara fleksibel	0% (0)	0% (0)	0% (0)	54.5% (6)	45.5% (5)	4.45	0.52	Tinggi
4	Politeknik mempunyai tenaga pengajar yang mencukupi.	0% (0)	9.1% (1)	18.2% (2)	45.5% (5)	27.3% (3)	3.91	0.83	Sederhana
5	Saya berminat untuk menyertai program tahfiz ini.	0% (0)	0% (0)	36.4% (4)	27.3% (3)	36.4% (4)	4.00	0.77	Tinggi
						Min Keseluruhan	4.09	0.69	Tinggi

Sts: Sangat Tidak Setuju, Ts : Tidak Setuju, Ks : Kurang Setuju, S : Setuju, Ss : Sangat Setuju

Bahagian C: Keperluan Dan Manfaat Program Tahfiz

Dapatan kajian kuantitatif bagi Bahagian C memperlihatkan gambaran yang jelas tentang penerimaan dan keyakinan pelajar terhadap keperluan serta manfaat pelaksanaan program tahfiz di Politeknik Port Dickson. Secara keseluruhan, skor min bagi lima item utama dalam bahagian ini ialah 4.46 dengan sisihan piawai (SP) 0.64, yang menunjukkan tahap persepsi yang tinggi dalam kalangan pelajar. Data ini membuktikan bahawa majoriti pelajar bukan sahaja menyokong pelaksanaan program tahfiz, malah menganggapnya sebagai satu keperluan yang wajar diberi perhatian oleh pihak institusi.

Bagi item pertama, “Program tahfiz boleh membantu meningkatkan disiplin pelajar”, kesemua responden memberikan maklum balas positif dengan skor min 4.55 (SP = 0.52) dan tahap tinggi. Dapatan ini menunjukkan bahawa pelajar yakin penglibatan dalam program tahfiz dapat memupuk disiplin diri, selari dengan matlamat pembentukan sahsiah pelajar.

Item kedua, “Hafazan al-Quran membantu meningkatkan daya ingatan”, memperoleh skor min tertinggi iaitu 4.73 (SP = 0.47) pada tahap tinggi. Hal ini membuktikan bahawa pelajar mengiktiraf manfaat kognitif hafazan al-Quran, khususnya dalam meningkatkan fokus dan keupayaan mengingat.

Bagi item ketiga, “Program ini dapat membantu mengurangkan tekanan akademik”, skor min dicatatkan pada 3.82 (SP = 1.17) dengan tahap tinggi tetapi sisihan piawai yang besar. Ini menunjukkan wujudnya variasi pandangan dalam kalangan pelajar, di mana sebahagian

besar percaya program ini mampu memberikan ketenangan dan keseimbangan emosi, namun terdapat juga pelajar yang kurang pasti akan keberkesanannya dalam aspek ini.

Item keempat, “Program ini membantu saya membentuk sahsiah dan nilai moral yang lebih baik”, memperoleh skor min 4.64 (SP = 0.50) dan berada pada tahap tinggi. Dapatan ini menegaskan keyakinan pelajar bahawa program tahfiz mampu menyumbang kepada pembangunan akhlak dan nilai moral yang positif.

Akhir sekali, item kelima, “Program tahfiz boleh memberi nilai tambah dalam kerjaya saya”, mencatatkan skor min 4.55 (SP = 0.52) pada tahap tinggi. Ini menggambarkan bahawa pelajar melihat program tahfiz bukan sahaja bermanfaat dari sudut kerohanian dan akademik, tetapi juga berpotensi meningkatkan imej profesional dan peluang kerjaya mereka.

Secara keseluruhannya, dapatan ini memperlihatkan corak yang konsisten dalam menyatakan keperluan terhadap program tahfiz serta keyakinan pelajar terhadap keberkesanannya. Keupayaan institusi untuk menyediakan persekitaran yang menyokong, tenaga pengajar yang kompeten, dan pendekatan pelaksanaan yang fleksibel adalah faktor utama yang akan menentukan kejayaan program ini. Implikasinya, pihak pengurusan institusi wajar meneliti dapatan ini sebagai asas merangka pelan tindakan yang komprehensif, merangkumi perancangan kurikulum, struktur penyampaian, latihan tenaga pengajar, dan penyesuaian masa pelaksanaan agar manfaat program ini dapat dimaksimumkan.

Jadual 3. Keperluan Dan Manfaat Program Tahfiz

BIL	PERNYATAAN	SKALA					MIN	SD	TAHAP
		1 STS	2 TS	3 KS	4 S	5 SS			
1	Program tahfiz boleh membantu meningkatkan disiplin pelajar.	0% (0)	0% (0)	0% (0)	45.5% (5)	54.5% (6)	4.55	0.52	Tinggi

5	Program tahfiz boleh memberi nilai tambah dalam kerjaya saya.	0% (0)	0% (0)	0% (0)	45.5% (5)	54.5% (6)	4.55	0.52	Tinggi
					Min Keseluruhan		4.46	0.64	Tinggi

Sts: Sangat Tidak Setuju, Ts: Tidak Setuju, Ks: Kurang Setuju, S: Setuju, Ss: Sangat Setuju

Bahagian D: Cabaran Dan Penambahbaikkan

Bahagian D kajian ini meneliti persepsi pelajar terhadap cabaran dan cadangan penambahbaikan bagi pelaksanaan program tahfiz di Politeknik Port Dickson. Secara keseluruhan, min bagi bahagian ini adalah 4.03 dengan sisihan piawai (SP) 0.90, menunjukkan tahap persepsi yang tinggi. Walaupun skor keseluruhan ini mencerminkan penerimaan positif, beberapa cabaran utama tetap dikenal pasti berdasarkan analisis item individu.

Bagi item pertama, “Kekangan masa adalah cabaran utama untuk mengikuti program ini”, skor min adalah 4.45 (SP = 0.69) pada tahap tinggi. Dapatan ini menunjukkan bahawa

sebahagian besar pelajar merasakan kekangan masa merupakan isu paling ketara yang boleh menjejaskan penglibatan dalam program tahfiz.

Item kedua, “Jadual akademik yang padat menyukarkan penyertaan dalam program tahfiz”, turut mencatatkan skor min 4.45 (SP = 0.69) pada tahap tinggi. Ini membuktikan bahawa selain kekangan masa, jadual pembelajaran yang padat turut menjadi faktor yang menghalang penyertaan pelajar.

Bagi item ketiga, “Kemudahan untuk program tahfiz di politeknik masih kurang mencukupi”, skor min yang direkodkan ialah 3.82 (SP = 1.17) pada tahap tinggi. Walaupun majoriti pelajar bersetuju, nilai sisihan piawai yang besar menunjukkan terdapat perbezaan pandangan dalam kalangan responden, menandakan sebahagian pelajar mungkin berpuas hati dengan kemudahan sedia ada, manakala sebahagian lain merasakan ia masih belum memadai.

Item keempat, “Program tahfiz perlu dijalankan secara dalam talian untuk lebih fleksibiliti”, memperoleh skor min 3.09 (SP = 1.29) pada tahap sederhana. Dapatan ini menunjukkan pandangan bercampur-campur, dengan sebahagian pelajar bersetuju bahawa pendekatan dalam talian boleh memberikan fleksibiliti, namun sebahagian lain mungkin lebih mengutamakan sesi fizikal.

Akhir sekali, item kelima, “Saya memerlukan sokongan pihak ibu bapa, guru dan rakan politeknik untuk menyertai program ini”, mencatatkan skor min 4.36 (SP = 0.67) pada tahap tinggi. Hal ini menggambarkan bahawa sokongan moral dan galakan daripada pihak terdekat adalah faktor penting yang mempengaruhi komitmen pelajar dalam menyertai program tahfiz.

Secara keseluruhannya, walaupun pelajar menunjukkan sokongan terhadap pelaksanaan program tahfiz, cabaran utama yang dikenal pasti merangkumi kekangan masa, jadual akademik yang padat, serta kekurangan kemudahan khusus. Di samping itu, pelaksanaan dalam talian dilihat sebagai satu alternatif yang mendapat sokongan sederhana. Oleh itu, pihak institusi perlu mempertimbangkan strategi penambahbaikan seperti penyusunan jadual yang lebih fleksibel, peningkatan kemudahan pembelajaran, serta penyediaan sokongan berterusan daripada komuniti kampus dan ibu bapa. Pendekatan strategik ini diharap dapat memastikan kelestarian dan keberkesanan program tahfiz di politeknik.

Jadual 4. Cabaran Dan Penambahbaikkan

Sts: Sangat Tidak Setuju, Ts: Tidak Setuju, Ks: Kurang Setuju, S: Setuju, Ss: Sangat Setuju

Bagi mendapatkan gambaran yang lebih menyeluruh terhadap keberkesanan dan kebolehlaksanaan program tahfiz sebagai aktiviti kokurikulum di Politeknik, kajian ini turut merangkumkan maklum balas pelajar melalui soalan terbuka. Analisis terhadap respons tersebut telah menghasilkan dua tema utama yang mencerminkan aspirasi serta cadangan konstruktif daripada para responden. Cadangan Penambahbaikan bagi Menjamin Kejayaan Program Tahfiz:

a. Pelaksanaan secara percubaan (pilot)

Sebilangan besar responden mencadangkan agar program tahfiz dimulakan secara rintis sebagai ujian lapangan. Pendekatan ini dilihat strategik untuk menilai tahap penerimaan pelajar serta menyesuaikan mekanisme pelaksanaan sebelum program diperluaskan secara menyeluruh.

b. Penjadualan yang sesuai dan fleksibel

Isu penjadualan menjadi antara kebimbangan utama pelajar. Cadangan penjadualan secara fleksibel seperti pelaksanaan pada waktu pagi, malam, atau hujung minggu dikemukakan agar pelajar tidak tertekan atau berkompromi dengan prestasi akademik. Penyesuaian masa ini dilihat sebagai faktor penentu kejayaan jangka panjang program.

c. Penyediaan tenaga pengajar dan bimbingan menyeluruh

Responden menekankan keperluan kepada tenaga pengajar berkelayakan daripada kedua-dua jantina, serta bimbingan khusus kepada pelajar yang tiada asas hafazan. Pendekatan ini bukan sahaja bersifat inklusif, malah mampu menyokong pelajar baharu untuk menyesuaikan diri dengan keperluan program.

d. Pengurusan masa pelajar

Kemahiran pengurusan masa dalam kalangan pelajar turut dikenalpasti sebagai elemen kritikal. Program tahfiz hanya dapat dihayati sepenuhnya jika pelajar mampu mengimbangi komitmen akademik dan aktiviti kokurikulum secara berkesan.

e. Nilai tambah dan pengiktirafan sahsiah

Program ini dilihat sebagai wadah untuk meningkatkan jati diri pelajar, memperkukuh nilai-nilai Islamik, dan memupuk identiti sebagai hafiz/hafizah dalam kalangan pelajar institusi teknikal. Justeru, pengiktirafan terhadap penyertaan dan pencapaian dalam program ini dianggap penting sebagai insentif moral dan motivasi pelajar.

Apabila diajukan persoalan mengenai kesesuaian program tahfiz dijadikan aktiviti kokurikulum bermula dari semester dua dan ke atas, majoriti responden menunjukkan sokongan yang sangat positif.

a. Peluang mengulang dan memulakan semula hafazan

Program ini dilihat sebagai peluang berharga untuk pelajar menyambung kembali hafazan yang pernah dimulakan atau mengulang semula hafazan yang telah dipelajari sebelum ini.

b. Integrasi pelajar aliran TVET dan latar belakang tahfiz

Cadangan ini disambut baik oleh pelajar yang mempunyai latar belakang tahfiz dan pada masa sama mengikuti bidang teknikal. Inisiatif ini dilihat sebagai bentuk integrasi holistik yang menggabungkan kompetensi duniawi dan ukhrawi.

c. Manfaat kerohanian dan disiplin diri

Program tahfiz juga diyakini mampu memberi impak positif terhadap pembentukan sahsiah pelajar. Antara manfaat yang dinyatakan termasuk pengisian masa lapang dengan aktiviti berfaedah, pengurangan tekanan akademik, peningkatan disiplin serta pembinaan peribadi seimbang dari segi intelek dan spiritual.

d. Tanggungjawab menjaga hafazan al-Quran

Responden menzahirkan rasa tanggungjawab untuk terus menjaga dan memelihara hafazan mereka sebagai satu amanah ilahi. Program tahfiz di politeknik dianggap sebagai platform signifikan untuk memenuhi tuntutan ini.

e. Cabaran: kekangan masa akademik

Walaupun sokongan adalah tinggi, terdapat segelintir responden yang menyuarakan kebimbangan berkenaan kesesuaian masa pelaksanaan, terutamanya bagi pelajar semester dua dan ke atas yang terikat dengan beban akademik yang semakin bertambah.

4. Kesimpulan

Kajian rintis ini memberikan gambaran awal yang jelas tentang potensi pelaksanaan program Tahfiz al-Quran di Politeknik Port Dickson. Dapatan menunjukkan bahawa wujudnya kumpulan pelajar yang mempunyai latar belakang, pengalaman, dan minat terhadap hafazan al-Quran, walaupun mereka sedang mengikuti pengajian dalam bidang TVET. Secara umum, kesemua responden menyatakan program ini boleh dilaksanakan di politeknik berdasarkan beberapa faktor, antaranya kesediaan pihak pengurusan, kemampuan pensyarah membimbing, kesesuaian jadual, dan keupayaan pelajar mengurus masa. Selain itu, majoriti responden berpandangan bahawa program ini perlu dilaksanakan kerana ia berpotensi membentuk sahsiah pelajar, menghidupkan budaya ilmu al-Quran, serta menyokong agenda pembangunan pelajar seimbang dari sudut intelek dan spiritual. Responden juga menyedari manfaat program ini termasuk membantu menambah hafalan, memelihara hafalan sedia ada, serta menyediakan platform penghayatan al-Quran dalam kalangan pelajar. Namun begitu, beberapa cabaran utama turut dikenalpasti, seperti kesukaran membahagikan masa antara akademik dan hafazan, kekangan jadual kuliah, dan kekurangan bimbingan khusus. Hal ini perlu diberi perhatian dalam merangka struktur program agar lebih fleksibel, relevan dengan persekitaran politeknik, dan mampu menarik minat serta komitmen pelajar. Secara keseluruhannya, dapatan kajian rintis ini menyokong bahawa pelaksanaan program Tahfiz al-Quran di politeknik adalah sesuatu yang realistik dan diperlukan, asalkan ia dirancang secara strategik dengan mengambil kira keperluan pelajar, sumber institusi, dan sinergi antara pendidikan teknikal dan pendidikan spiritual.

DIGITAL MARKETING STRATEGY ON FACEBOOK AND SERVICE QUALITY TOWARDS PRODUCT SALES AT PT INGCO TEKNIKA INDONESIA: CH STORE

Perdi Saputra Silalahi*, Cece

Marketing Management Department, Sekolah Tinggi Ilmu Management Sukma, 20219 Medan Kota, North Sumatra, Indonesia

*Corresponding author email: perdisaputrahi69@gmail.com

Abstract

This study aims to evaluate the impact of digital marketing strategies through the Facebook platform and service quality on product sales at PT Ingco Teknika Indonesia. Facebook, as one of the main social media platforms, is utilized to reach consumers more efficiently. A quantitative approach was used in this study, employing a survey method using questionnaires distributed to consumers who had interacted with the company via Facebook. The analysis results show that both digital marketing strategies and service quality have a positive and significant effect on increasing sales. Factors such as targeted advertising, engaging content presentation, quick responses, and professional complaint handling have proven to encourage consumers in making purchasing decisions. These findings provide strategic contributions for PT Ingco Teknika Indonesia in optimizing the use of Facebook and improving service quality to achieve targeted sales.
Keywords: Digital marketing; Facebook; Service quality.

1. Introduction

Digital marketing has become one of the most powerful strategies in modern business, allowing companies to connect with consumers through social media platforms. Among them, Facebook stands out as a key channel due to its vast user base and interactive features. Previous studies have demonstrated that social media marketing positively influences consumer purchasing decisions (Saragih, 2021). Moreover, service quality remains an essential determinant of customer satisfaction and loyalty (Putri & Nugroho, 2020). Wahyuni (2019) also emphasized that creative and informative social media content improves brand awareness and boosts sales. However, despite the growing use of Facebook for promotional purposes, research on how digital marketing and service quality jointly affect sales performance in Indonesian retail settings is limited. Therefore, this study investigates the influence of Facebook-based digital marketing strategies and service quality on product sales at PT Ingco Teknika Indonesia.

2. Methodology

This study used two types of data: primary data and secondary data. Primary data were collected directly from respondents through questionnaires and observations at the CH Store. Secondary data were gathered from internal sources, such as sales reports and company Facebook activity logs. The research employed a field research method, which involved researchers directly visiting the study location to collect data and gain a real-world understanding.

The primary data collection method was a questionnaire, which used a Likert scale to measure respondents' attitudes and perceptions. The scale ranged from 1 (Strongly Disagree) to 5 (Strongly Agree).The sample was determined using accidental sampling, which involved selecting 50 respondents based on random encounters with customers over a three-month period. The sample size was validated using Slovin's formula with a standard error of 10%. The final sample size was found to be 50 from a population of 100. The data analysis methods

included validity and reliability tests, descriptive statistics, multiple linear regression analysis, t-tests and F-tests, and the coefficient of determination (R2).

3. Results and Discussion

Based on previous studies, there is a consistent finding that digital marketing strategies through social media particularly Facebook and service quality have a positive impact on consumer purchasing decisions. Saragih (2021) emphasized the importance of targeted advertising and active communication, which aligns with the findings of this study regarding Facebook's effectiveness in reaching consumers. Similarly, Putri and Nugroho (2020) supported the notion that quick responsiveness and effective complaint handling are crucial in enhancing customer loyalty and driving sales. These findings reinforce the argument that digital marketing strategies cannot stand alone without being supported by high-quality service. Therefore, the integration of effective digital promotion and professional customer service is essential for boosting sales in the current digital era, as demonstrated by the case of PT Ingco Teknika Indonesia.

3.1 Respondent Classification by Gender

This table presents a breakdown of the study's respondents based on gender. Out of the total of 50 participants, 33 are male and 17 are female. This distribution is logical, as the products sold at PT Ingco Teknika Indonesia, which primarily consist of tools and equipment, typically attract a higher proportion of male customers.

Table 1. Respondent Classification by Gender

No	Gender	Amount
	Man	33
	Woman	17
	Total	50

The table provides a clear view of the demographic composition of the sample, which is useful for understanding the context of the purchasing decisions being analyzed.

3.2 Respondent Classification by Age

This table shows the age distribution of the 50 respondents. The majority of respondents, specifically 41 individuals, are between the ages of 20 and 25. This is a noteworthy finding because this age group often comprises individuals who are starting careers or businesses in fields such as carpentry or automotive repair.

Table 2. Respondent Classification by Age

No	Age	Amount
1	20 - 25 year	41
2	26 - 35 year	4
3	36- 40 year	5
4	46 - 55 year	0
5	> 55 year	0
	Total	50

The data also indicates a small number of respondents in the 26-35 and 36-40 age brackets, and none in the older age groups. This shows that the company's Facebook marketing and services are predominantly reaching a younger professional demographic.

3.3 Validity and Reliability Tests

The Validity and Reliability test results confirm that the questionnaire used in the study is a sound and trustworthy instrument for collecting data. Validity ensures that the questions accurately measure the intended concepts, while reliability ensures that the instrument produces consistent results. For this study, an instrument is considered valid if its calculated r-value is greater than or equal to 0.2542. All of the test items for Facebook marketing, service quality, and product sales were found to have r-values above this threshold, confirming their validity.

Table 3. Reliability test

Cronbach's Alpha	N of items
0.953	15

Cronbach's Alpha = 0.953 (N = 15) → Reliable

Reliability is confirmed when the Cronbach's Alpha value is greater than 0.6. The study's instrument achieved a Cronbach's Alpha of 0.953, indicating that it is highly reliable and the responses are consistent.

3.3 Multiple Linear Regression

The multiple linear regression results show the relationship between the independent variables (Facebook Digital Marketing and Service Quality) and the dependent variable (Product Sales). The regression equation, Y=2.198+0.335X1+0.592X2, indicates that both digital marketing and service quality have a positive effect on sales.

Coefficients[a]

Model		Unstandardized Coefficients		Standardized Coefficients		
		B	Std. Error	Beta	t	Sig.
1	(Constant)	2.198	1.342		1.637	.108
	x1	.335	.074	.386	4.557	.000
	x2	.592	.083	.601	7.099	.000

a. Dependent Variable: y

Fig. 1. Multiple linear regression

Regression equation: $Y = 2.198 + 0.335\ X_1 + 0.592\ X_2$
Where:
Y = Product Sales
X_1 = Facebook Digital Marketing
X_2 = Service Quality

The coefficients for both variables are positive, which means that as digital marketing efforts and service quality improve, product sales are expected to increase.

3.4 Simultaneous Test (F-test)

The F-test assesses whether the independent variables, as a group, have a significant effect on the dependent variable. The results of this test are crucial for determining the overall significance of the model. The calculated F-value is 193.192, which is significantly greater than the F-table value of 3.16. The test's significance level is 0.000, which is below the 0.05 threshold.

ANOVA[a]

Model		Sum of Squares	df	Mean Square	F	Sig.
1	Regression	734.353	2	367.176	193.192	.000[b]
	Residual	89.327	47	1.901		
	Total	823.680	49			

a. Dependent Variable: y

b. Predictors: (Constant), x2, x1

Fig. 2. Simultaneous test

This means that the null hypothesis (H0) is rejected, and it can be concluded that Facebook digital marketing and service quality, when considered together, have a significant effect on product sales.

3.5 Partial Test (t-test)

The t-test evaluates the individual contribution of each independent variable to the dependent variable. The results show that both digital marketing (X1) and service quality (X2) are significant predictors of sales.

Coefficients[a]

Model		Unstandardized Coefficients		Standardized Coefficients		
		B	Std. Error	Beta	t	Sig.
1	(Constant)	2.198	1.342		1.637	.108
	x1	.335	.074	.386	4.557	.000
	x2	.592	.083	.601	7.099	.000

a. Dependent Variable: y

Fig. 3. Partial test

The t-value for digital marketing is 4.557 with a significance of 0.000, while the t-value for service quality is 7.099 with a significance of 0.000. Since both significance values are below 0.05, it is confirmed that each variable individually has a significant impact on product sales.

The study's findings on digital marketing align with previous research by Saragih (2021) and Wahyuni (2019). The use of Facebook is effective in reaching consumers through targeted advertising and engaging content. This study found that a better customer experience from digital marketing leads to greater customer loyalty. This is consistent with the finding that visually appealing and informative content on Facebook can significantly improve consumer engagement and encourage purchasing behavior.

The results confirm that service quality has a positive and significant effect on sales, with a more dominant impact than digital marketing. This is supported by the findings of Putri and Nugroho (2020), which emphasized that quick responsiveness and effective complaint handling are crucial for enhancing customer satisfaction and sales. Customers who are satisfied with the service and have an emotional brand attachment are more likely to be loyal, leading to repeat purchases and product recommendations.

The findings highlight that digital marketing strategies and high-quality service cannot stand alone. The successful case of PT Ingco Teknika Indonesia demonstrates that integrating effective digital promotion with professional customer service is essential for boosting sales in

the current digital era. Both factors together explain a substantial 89.2% of the variation in product sales, with service quality having a more dominant influence.

4. Conclusion

Based on the research findings, it can be concluded that Facebook digital marketing has a positive and significant effect on product sales at PT Ingco Teknika Indonesia. Likewise, service quality also contributes positively and significantly to sales growth. When considered simultaneously, both Facebook digital marketing and service quality have a significant positive effect on sales. These variables combined explain 98% of the variation in customer purchases, with service quality having a more dominant impact.

TAHAP PENGAMALAN AJARAN ISLAM DALAM KALANGAN PELAJAR POLITEKNIK MERLIMAU MELAKA DARI ASPEK IBADAH

Suriati Barning*, Mohd Faizal Mat Pesa

Jabatan Pengajian Am, Politeknik Merlimau 77300 Merlimau Melaka

*Alamat e-mel penulis: suriati@pmm.edu.my

Abstrak

Pengamalan ajaran Islam adalah satu perkara yang amat penting dalam agama. Kemenjadian seorang manusia dilihat kepada kesempurnaan pengamalan ajaran Islam dari aspek aqidah, ibadah dan akhlak. Melalui pelaksanaan kursus-kursus Pendidikan Islam yang ditawarkan di PMM ianya perlu sentiasa dinilai agar sentiasa mencapai matlamatnya. Oleh itu, pengamalan ajaran Islam dalam kalangan pelajar di PMM perlu dikaji kerana ia relevan dengan pelaksanaan kursus-kursus Pendidikan Islam di institusi berkenaan. Kajian ini adalah bertujuan untuk mengkaji tahap pengamalan ajaran Islam dalam kalangan pelajar PMM dari sudut ibadah. Metodologi kajian yang digunakan ialah kajian lapangan yang menggunakan sepenuhnya kaedah pengumpulan data iaitu borang kaji selidik. Data yang diperolehi daripada borang kaji selidik dianalisis menggunakan perisian SPSS dan dapatan kajian dihuraikan dengan menggunakan kaedah statistik deskriptif dan inferensi. Hasil kajian mendapati tahap pengamalan ajaran Islam dalam kalangan responden dalam aspek yang dikaji iaitu ibadah = 4.21, berada pada tahap yang tinggi. Ini menunjukkan bahawa kursus-kursus Pendidikan Islam berjaya mempengaruhi tahap pengamalan ajaran Islam dalam kalangan pelajar PMM. Kesimpulannya, dapatan kajian ini menunjukkan bahawa tahap pengamalan ajaran Islam dalam kalangan pelajar di PMM dalam aspek ibadah adalah baik.
Katakunci: Pengamalan ajaran Islam; ibadah; Pendidikan Islam.

1. Pengenalan

Amalan ibadah merupakan perkara penting dalam kehidupan seorang mukmin. Ia lambang kesetian seorang hamba terhadap penciptanya. Ibadah meliputi segala aspek yang meliputi makna kepatuhan kepada segala perintah Allah S.W.T. dan meninggalkan segala laranganNya (al-Ghazali, 1994). Ibadah dapat menghubungkan terus seorang hamba dengan penciptanya, malah ia juga dapat mengembalikan manusia kepada tujuan asal kejadian nya di muka bumi iaitu untuk beribadah kepada Allah S.W.T. (al-Ghazali, 2000) sebagaimana dinyatakan dalam firmanNya:

وَمَا خَلَقْتُ الْجِنَّ وَالإِنْسَ إِلا لِيَعْبُدُونِ

Maksud: “Dan (ingatlah) Aku tidak menciptakan jin dan manusia melainkan untuk mereka menyembah dan beribadat kepadaKu”

(Surah al Zariyat,51:56)

Ibadah bukan sahaja melambangkan kepatuhan seorang hamba kepada penciptanya, tetapi dapat memberikan banyak manfaat dalam kehidupan manusia. Selain dapat memberikan ketengan jiwa, menyedarkan tentang hakikat diri dan menginsafi kelemahan diri, ibadah juga dapat memainkan peranan dalam menyelesaikan masalah yang dihadapi dalam kehidupan seharian mereka. Hal ini berlaku kerna ibadah yang dilaksanakan dengan khusyuk dan tawaduk dapat mendekatkan seseorang kepada Allah S.W.T:

وَمَنْ يَتَّقِ اللَّهَ يَجْعَلْ لَهُ مَخْرَجًا

Maksud: “Dan sesipa yang bertaqwa kepada Allah S.W.T. (dengan mengerjakan suruhanNya dan meninggalkan laranganNya) nescaya Allah akan mengadakan baginya jalan keluar (dari segala perkara yang menyusahkannya)”

(Surah al-Talaq, 65:2)

Justeru itu pengkaji melihat pengamalan ibadah adalah pengamalan hidup beragama yang berbentuk penerapan asas agama yang mengutamakan aplikasi dan penghayatan agama itu sendiri. Dalam konteks agama Islam, kehidupan beragama ini disinonimkan dengan menjadikan Islam sebagai *al-Din* atau sebuah cara hidup yang mana secara automatiknya menuntut penganutnya menghayati dan mengamalkan ajaran Islam secara menyeluruh baik dari aspek akidah, ibadah mahupun akhlak.

Agama Islam ialah sebuah agama yang lengkap dan sempurna. Selain dari memberi penekanan terhadap unsur-unsur akhirat, agama Islam turut menitikberatkan urusan-urusan keduaniaan yang merangkumi setiap aspek kehidupan manusia. Matlamatnya adalah untuk membentuk seorang manusia yang mengamalkan cara hidup seperti yang terkandung dalam ajaran Islam. Menurut Sidek Baba (2006) ilmu dalam Islam terbentuk dalam acuan yang sepadu. Ilmu-ilmu seperti akidah, akhlak dan ibadah adalah tunjang yang selaras dengan ilmu sains dan teknologi serta ilmu-ilmu yang lain. Ilmu dalam Islam merangkumi keseluruhan dengan meletakkan fakta dan data yang laras dengan teori sains. Kesemuanya bertujuan untuk mengenali dan mengagumi kekuasaan dan kebesaran Allah S.W.T.

Ghazali Darussalam berpendapat bahawa pendidikan Islam adalah segala bentuk pengajaran dan pendidikan yang diterima oleh umat Islam yang berlandaskan al-Quran dan al-Sunnah. Beliau menafikan bahawa pendidikan selain yang dinyatakan tersebut adalah pendidikan asing (Ghazali Darussalam, 2004). Fathi Yakan (1997), pula menyatakan bahawa pendidikan Islam ialah proses membina individu dan masyarakat berdasarkan paksi Islam sama ada dalam aspek pegangan, pemikiran mahupun perbuatan.
Menurut Abdullah Nasih (1988), Pendidikan Islam yang ideal ialah meliputi aspek-aspek pendidikan keimanan, akhlak, jasmani, akal, psikologi, sosial dan seks. Penekanan ini diperkukuhkan lagi dengan hadis yang menjelaskan tentang kepentingan akhlak dan sahsiah dalam kehidupan seorang muslim. Sabda Rasulullah S.A.W.

"إِنَّمَا بُعِثْتُ لِأُتَمِّمَ مَكَارِمَ الْأَخْلَاقِ"

Ertinya: "Sesungguhnya aku diutus hanya untuk menyempurnakan kemuliaan akhlak."

(Riwayat Al-Baihaqi)

Melalui penjelasan ini dapatlah difahami bahawa Pendidikan Islam bertujuan mencapai pertumbuhan yang seimbang dalam keseluruhan pembentukan sahsiah manusia melalui latihan jasmani, emosi, rohani dan intelek manusia. Oleh kerana itu Pendidikan Islam mampu membentuk pelajar yang soleh dan berakhlak mulia.

Daripada hasil kajian Siti Mariam Samat (2002) ke atas salah sebuah politeknik mendapati bahawa pihak pengurusan politeknik tersebut telah melakukan pengawalan yang tinggi bagi menangani masalah sosial, namun masalah sosial ini tetap berterusan walaupun ia tidak kritikal disebabkan faktor-faktor di luar kawalan pihak pengurusan. Sikap sebahagian pihak pentadbiran institusi-institusi pendidikan dan juga pengajar-pengajar yang hanya mementingkan kepada kecemerlangan akademik semata-mata haruslah diperbetulkan di mana aspek pembangunan insan dan penerapan nilai harus diberikan perhatian yang menyeluruh bagi melahirkan pelajar yang cemerlang dan bersahsiah tinggi. Sehubungan itu Ab. Halim Tamuri (2000) mendapati bahawa masih ramai guru yang tidak dapat menerapkan nilai-nilai murni semasa proses pengajaran dan pembelajaran (PdP) berlangsung.

Terdapat beberapa buah kajian yang berkaitan dengan kajian ini antaranya kajian yang dilakukan oleh Seri Kartini Jurami (2013), yang mendapati tahap pengamalan ajaran Islam dalam kalangan pelajar Politeknik Ungku Omar dalam aspek akidah, ibadah dan akhlak berada pada tahap yang tinggi. Menurut kajian Asmahan (2009), mendapati tahap pengamalan ajaran Islam dalam kalangan responden kajian dari aspek akidah, ibadah dan akhlak berada pada tahap tinggi. Begitu

juga dengan kajian Nor Hayati Fatmi Talib et al. (2018), mendapati tahap akidah, syariat dan muamalat berada pada tahap yang tinggi. Ditambah lagi kajian Mohd Khairi Shafie (2016), mendapati tahap pengamalan ajaran Islam meliputi akhlak juga berada pada tahap tinggi. Begitu juga dengan kajian Zainuddin, M. Z., dan Razak, K. A. (2021), juga menunjukkan tahap amalan ibadah adalah tinggi dengan nilai min 3.94.

Manakala kajian Alias (2010) bertajuk *Penilaian Pelaksanaan Kurikulum Pendidikan Islam Politeknik Kementerian Pengajian Tinggi Malaysia*, mendapati tingkah laku pelajar politeknik dari aspek akhlak berada pada tahap tinggi, manakala tingkah laku ibadah dan akhlak berada pada tahap sederhana. Ini menunjukkan keberkesanan Pendidikan Islam yang dilaksanakan di politeknik masih belum mencapai tahap keberkesanan yang tinggi dalam aspek pengamalan.

Pengkaji mendapati dua permasalahan yang dikenalpasti. Pertama, pelajar tidak mengamalkan pelajaran yang dipelajari dalam Pendidikan Islam dalam kehidupan seharian. Kedua, tahap pengamalan ajaran Islam dalam kalangan pelajar di politeknik masih belum mencapai tahap pengamalan yang tinggi.Sehubungan itu, timbul persoalan sejauhmanakah pula tahap pengamalan ibadah dalam kalangan pelajar di Politeknik Merlimau, Melaka (PMM). Justeru itu, satu kajian perlu dijalankan untuk mengkaji tahap pengamalan ibadah dan adakah ia berbeza daripada faktor jantina dalam kalangan pelajar Politeknik Merlimau, Melaka. Objektif kajian ini adalah :

- Mengukur tahap pengamalan ajaran Islam dalam kalangan pelajar Politeknik Merlimau Melaka dalam aspek ibadah
- Membandingkan perbezaan persepsi pelajar terhadap pengamalan ajaran Islam dalam aspek ibadah berdasarkan jantina

2. Metodologi

Dalam kajian ini, pengkaji menggunakan dua lapangan penyelidikan iaitu kajian perpustakaan dan kajian lapangan bagi membantu penulis untuk memahami permasalahan yang dikaji dengan lebih mudah. Bagi kajian ini, penulis telah menggunakan dua metode utama iaitu Metode Pengumpulan Data dan Metode Analisis Data. Kaedah ini sesuai digunakan untuk mengkaji populasi yang ramai (Islam et al., 2022, Noor et al., 2024, & Mohd Najib A. Ghafar, 1998). Sebanyak 381 kertas soal selidik diedarkan kepada sampel kajian yang terdiri dari 5000 orang populasi. Jumlah sampel adalah bersesuaian dengan Jadual Penentuan Saiz Sampel seperti yang dikemukakan oleh Krejcie dan Morgan (1970), (Noor et al., 2024).

Soalan kaji selidik ini dibentuk oleh penyelidik sendiri yang diadaptasi daripada soal selidik yang digunapakai oleh pengkaji terdahulu iaitu Seri Kartini Jurami (2013), Jamil et al., (2024) dan Asni et al., (2024) bertujuan untuk mengukur tahap pengamalan ajaran Islam dalam kalangan pelajar Politeknik Merlimau dalam aspek ibadah.

Kertas soal selidik dibahagikan kepada dua bahagian utama. Bahagian pertama mengandungi soalan mengenai latar belakang responden iaitu umur, jabatan pengajian, program pengajian serta penginapan pelajar semasa pengajian. Bahagian kedua pula mengandungi soalan berkenaan tahap pengamalan ajaran Islam dalam kalangan pelajar Politeknik Merlimau dalam aspek ibadah.

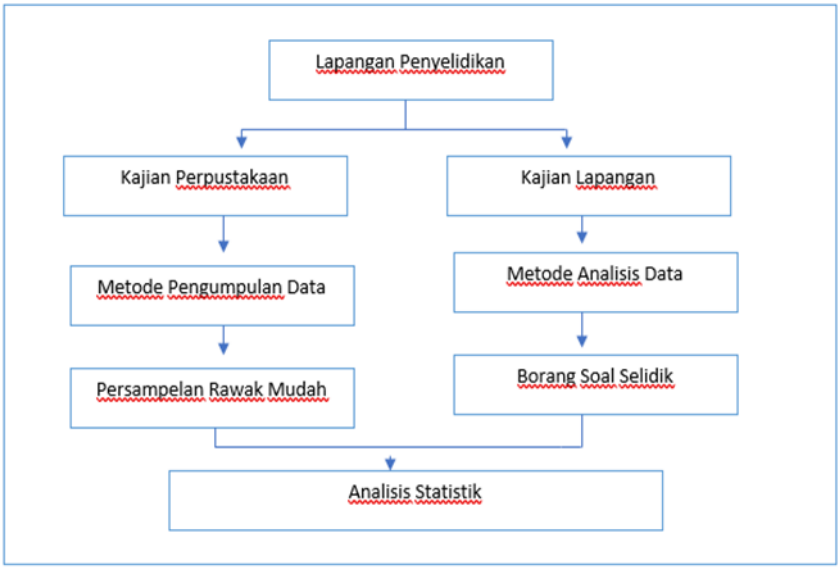
Dalam kajian ini kaedah sampel rawak mudah digunakan bagi tujuan memilih sampel yang diperlukan dalam kajian. Dengan menggunakan kaedah jenis ini, setiap individu mempunyai peluang yang sama untuk dipilih (Cornesse et al., 2020). Penyelidik mengedar sendiri kertas soal selidik ke setiap bilik kuliah dengan kerjasama pensyarah Kursus Pendidikan Islam di Politeknik Merlimau Melaka. Sebelum kertas soal selidik diedarkan, satu penerangan ringkas diberikan agar responden memahami objektif kajian yang ingin diperolehi. Dengan cara ini

penyelidik dapat mengawasi responden agar menjawab persoalan yang dikemukakan berdasarkan situasi dan cara hidup mereka serta tidak terpengaruh oleh jawapan rakan-rakan. Selain itu, kaedah ini digunakan kerana dengan cara ini kertas soal selidik dapat diperolehi dengan cepat dan kadar pulangannya yang tinggi.

Kajian ini adalah berbentuk kajian tinjauan kerana ia menerangkan fenomena dengan menganalisis data yang diperolehi daripada soal selidik. Semua maklumat yang diperolehi akan diklasifikasikan mengikut aspek yang telah ditentukan dan ditafsirkan secara kuantitatif. Dalam melaksanakan kajian ini, penyelidik telah menjalankannya melalui dua kaedah penyelidikan iaitu melalui kajian tinjauan dan kajian kepustakaan.

Alat atau instrumen yang digunakan dalam kajian tinjauan adalah berbentuk borang soal selidik yang diedarkan kepada responden. Manakala kajian kepustakaan pula bertujuan untuk mencari dan mengumpul bahan serta maklumat berkaitan kajian. Perpustakaan yang menjadi rujukan penyelidik ialah Perpustakaan Politeknik Merlimau Melaka.
Kajian ini dijalankan hanya tertumpu di Politeknik Merlimau, Melaka. Rasional pemilihan kerana pelajarnya melebihi 5 ribu orang dan mudah untuk dilihat kebolehpercayaan tahap amalan ajaran Islam dalam kalangan pelajar Politeknik Merlimau Melaka dalam aspek ibadah (Noor et al., 2024).

Penyerahan borang soal selidik ini dilakukan sendiri oleh penyelidik bagi memastikan tujuan kajian dapat diterangkan dengan lebih terperinci kepada sampel-sampel yang terlibat. Tempoh masa tertentu diberikan kepada responden untuk menjawab borang soal selidik. Setelah borang soal selidik dikumpulkan, pengkaji mula menganalisis data-data yang terdapat pada borang soal selidik tersebut. Sebelum itu, pengkaji telah mengasingkan borang soal selidik mengikut semester pengajian pelajar-pelajar Politeknik Merlimau bagi memudahkan data-data dimasukkan dan dianalisis secara sistematik. Data-data juga akan dianalisis bersumberkan dokumen daripada jurnal-jurnal, prosiding-prosiding, kertas kerja seminar dan buku-buku yang berkaitan. Data-data yang diperoleh tadi dianalisis dan direkodkan sebelum kesimpulan berkaitan dengannya dilakukan.
Data-data yang dikumpulkan dianalisis dengan menggunakan program *Statistical For Social Science (SPSS)* iaitu suatu perisian komputer bagi menganalisis data peratusan dan min. Bentuk laporan statistik deskriptif berdasarkan min, kekerapan dan peratusan serta statistik referensi.



Rajah 1. Aliran proses kajian

3. Dapatan dan Perbincangan

Kajian ini melibatkan seramai 381 orang pelajar Politeknik Merlimau Melaka dengan latar belakang seperti jantina dan jabatan. Jumlah sampel adalah bersesuaian dengan Jadual Penentuan Saiz Sampel seperti yang dikemukakan oleh Krejcie dan Morgan, 1970 (Noor et al., 2024). Huraian profil demografi kajian dipaparkan seperti Jadual 1 berikut:

Jadual 1. Profil demografi kajian

Demografi	Kekerapan	Peratusan
Jantina		
Lelaki	154	44.3%
Perempuan	194	55.7%
Jabatan		
Jabatan Pelancongan dan Hospitaliti (JPH)	78	22.4%
Jabatan Perdagangan (JP)	61	17.5%
Jabatan Kejuruteraan Awam (JKA)	64	18.4%
Jabatan Kejuruteraan Elektrik (JKE)	66	19.0%
Jabatan Kejuruteraan Mekanikal (JKM)	79	22.7%

Jadual 1 di atas menunjukkan bahawa berdasarkan jantina, seramai 154 orang (44.3%) pelajar lelaki dan seramai 194 orang (55.7%) pelajar perempuan. Seterusnya berdasrkan jabatan menunjukkan seramai 78 orang (22.4%) pelajar Jabatan Pelancongan dan Hospitaliti (JPH), seramai 61 orang (17.5%) pelajar Jabatan Perdagangan (JP), seramai 64 orang (18.4%) pelajar Jabatan Kejuruteraan Awam (JKA), seramai 66 orang (19.0%) pelajar Jabatan Kejuruteraan Elektrik (JKE) dan seramai 79 orang (22.7%) pelajar Jabatan Kejuruteraan Mekanikal (JKM).

Jadual 2. Tahap ibadah dalam kalangan pelajar Politeknik Merlimau Melaka

Bil.	Ibadah pelajar	STS	TS	KS	S	SS	Min	SP	Interp.
	Setelah saya mempelajari Pendidikan Islam……								
1	Saya menunaikan solat fardhu lima waktu setiap hari	2 (0.6%)	8 (2.3%)	128 (36.8%)	128 (36.8%)	82 (23.6%)	3.80	0.84	Tinggi
2	Saya menunaikan solat lima waktu di mana sahaja saya berada	2 (0.6%)	26 (7.5%)	130 (37.4%)	128 (36.8%)	62 17.8%)	3.64	0.88	Tinggi
3	Saya mengerjakan solat fardhu di awal waktu	2 (0.6%)	22 (6.3%)	188 (54.0%)	96 (27.6%)	40 (11.5%)	3.43	0.80	Tinggi
4	Saya menunaikan sembahyang fardhu walaupun kesuntukan waktu untuk menghadiri kelas	2 (0.6%)	32 (9.2%)	140 (40.2%)	90 25.9%)	84 (24.1%)	3.64	0.97	Tinggi
5	Saya berpuasa di bulan Ramadhan	-	2 (0.6%)	12 (3.4%)	80 (23.0%)	254 (73.0%)	4.68	0.57	Sangat Tinggi
6	Saya akan memastikan zakat fitrah saya dibayar	2 (0.6%)	-	22 (6.3%)	92 (26.4%)	232 (66.7%)	4.59	0.66	Sangat Tinggi
7	Saya akan mandi wajib bila keluar tanda-tanda hadas besar	-	-	14 (4.0%)	74 (21.3%)	260 (74.7%)	4.71	0.54	Sangat Tinggi
8	Saya akan berdoa kepada Allah setiap kali selepas solat	2 (0.6%)	-	10 (2.9%)	88 (25.3%)	248 (71.3%)	4.67	0.59	Sangat Tinggi
9	Saya selalu melakukan perkara-perkara sunat yang boleh memberi pahala kepada saya. (cth: berzikir)	-	6 (1.7%)	86 (24.7%)	122 (35.1%)	134 (38.5%)	4.10	0.83	Sangat Tinggi
10	Saya sentiasa memastikan makanan yang saya makan adalah halal	-	-	20 (5.7%)	74 (21.3%)	254 (73.0%)	4.67	0.58	Sangat Tinggi
11	Saya sentiasa menutup aurat sebagaimana yang diwajibkan di mana sahaja saya berada	-	10 (2.9%)	58 (16.7%)	136 (39.1%)	144 (41.4%)	4.19	0.81	Sangat Tinggi

12	Saya tidak suka melihat rancangan televisyen yang mendedahkan aurat	14 (4.0%)	24 (6.9%)	138 (39.7%)	108 (31.0%)	64 (18.4%)	3.53	1.00	Tinggi
13	Saya membaca 'Bismillah' sebelum saya makan	-	-	14 (4.0%)	70 (20.1%)	264 (75.9%)	4.72	0.53	Sangat Tinggi
14	Saya membaca ‘Alhamdulillah’ selepas saya makan	2 (0.6%)	4 (1.1%)	40 (11.5%)	86 (24.7%)	216 (62.1%)	4.47	0.79	Sangat Tinggi
15	Saya berusaha untuk mendalami hukum-hakam Islam dengan lebih baik	-	6 (1.7%)	42 (12.1%)	136 (39.1%)	164 (47.1%)	4.32	0.75	Sangat Tinggi
	Keseluruhan						4.21	0.46	Sangat Tinggi

Jadual 2 di atas menunjukkan bahawa setiap item ibadah dalam kalangan pelajar Politeknik Merlimau Melaka berada pada 2 tahap sahaja iaitu tahap sangat tinggi dan tinggi. Item-item ibadah dikategorikan kepada solat lima waktu, zakat, mandi wajib, adab ibadah dan hukum syariat Islam. Item yang mempunyai min yang paling tinggi ialah kategori adab ibadah iaitu saya membaca 'Bismillah' sebelum saya makan (min = 4.72 dan sp = 0.53) berada pada tahap sangat tinggi. Dari segi kekerapan dan peratusan menunjukkan bahawa seramai 264 orang (75.9%) pelajar menyatakan sangat setuju, seramai 70 orang (20.1%) pelajar menyatakan setuju dan seramai 14 orang (4.0%) pelajar menyatakan kurang setuju. Manakala item yang mempunyai min yang paling rendah ialah kategori solat iaitu item saya mengerjakan solat fardhu di awal waktu (min = 3.43 dan sp = 0.80) berada pada tahap tinggi. Dari segi kekerapan dan peratusan menunjukkan bahawa seramai 188 orang (54.0%) pelajar menyatakan kurang setuju, seramai 96 orang (27.6%) pelajar menyatakan setuju, seramai 40 orang (11.5%) pelajar menyatakan sangat setuju, seramai 22 orang (6.3%) pelajar menyatakan tidak setuju dan seramai 2 orang (0.6%) pelajar menyatakan sangat tidak setuju. Secara keseluruhannya menunjukkan bahawa ibadah dalam kalangan pelajar Politeknik Merlimau Melaka berada pada tahap sangat tinggi (min = 4.21 dan sp = 0.46).

Jadual 3. Tahap ibadah dalam kalangan pelajar Politeknik Merlimau Melaka Mengikut Kategori

Bil	Kategori	Tahap	Turutan
1	Adab ibadah (memulai makan dengan bacaan Bismillah	Sangat tinggi	Tinggi
2	Zakat	Sangat tinggi	
3	Mandi wajib	Sangat tinggi	Sederhana
4	Hukum syariat Islam	Sangat tinggi	
5	Rancangan televisyen	Tinggi	
6	Solat	Tinggi	Rendah

Jadual 4. Tahap pengamalan ajaran Islam dari aspek ibadah dalam kalangan pelajar Politeknik Merlimau Melaka

No	Pengamalan ajaran Islam	Min	Sisihan Piawai	Interpretasi
1	Ibadah	4.21	0.46	Sangat tinggi

Jadual 4 menunjukkan bahawa pengamalan ajaran Islam dalam kalangan pelajar dari aspek ibadah (min = 4.21 dan sp = 0.46). Ini menunjukkan bahawa pengamalan ajaran Islam dari aspek ibadah dalam kalangan pelajar berada pada tahap sangat tinggi (min = 4.21 dan sp = 0.46).

Persoalan kajian: Adakah terdapat perbezaan pengamalan ajaran Islam dari aspek ibadah dalam kalangan pelajar Politeknik Merlimau Melaka berdasarkan jantina?

Ho1.1 : Tidak terdapat perbezaan yang signifikan ibadah dalam kalangan pelajar Politeknik Merlimau Melaka berdasarkan jantina

Analisis MANOVA dijalankan bagi melihat perbezaan pengamalan ajaran Islam dalam kalangan pelajar Politeknik Merlimau Melaka berdasarkan jantina. Sebelum analisis MANOVA dijalankan, pengkaji terlebih dahulu menjalankan ujian bagi menentukan matrik kehomogenan varian-kovarian (*homogenity of the varians-covariance matrics*) dengan menggunakan ujian Box's M (*Box's M test*). Analisis ujian Box'M dapat dilihat seperti dalam Jadual 5 berikut.

Jadual 5. Box'M perbezaan pengamalan ajaran Islam dalam kalangan pelajar Politeknik Merlimau Melaka berdasarkan jantina

Box's M	Nilai-F	df1	df2	Sig.
33.776	5.576	6	756553.811	0.000

Jadual 5 di atas menunjukkan terdapat perbezaan *varian-covarian* yang signifikan dalam kalangan pemboleh ubah bersandar untuk semua aras pemboleh ubah bebas dengan nilai Box's M = 33.776 dan sig = 0.000 ($p<0.001$). Ini bermakna, varian-covarian pemboleh ubah bersandar adalah tidak homogenus merentasi pemboleh ubah bebas. Analisis Manova kekal digunakan bagi melihat perbezaan pengamalan ajaran Islam dalam kalangan pelajar Politeknik Merlimau Melaka berdasarkan jantina kerana bilangan sampel yang dilibatkan dalam kajian dalam jumlah yang banyak (Pallant 2007). Hasil analisis Manova dapat dilihat seperti Jadual 6 berikut:

Jadual 6. Manova perbezaan pengamalan ajaran Islam dalam kalangan pelajar Politeknik Merlimau Melaka berdasarkan jantina

Pengamalan ajaran Islam	Jantina	N	Min	Sisihan piawai	Type III Sum of Squares	Df	Jumlah kuasa dua	F	Sig.
Ibadah	Lelaki	154	4.30	0.49	0.121	1	0.121	0.612	0.435
	Perempuan	194	4.26	0.41					

Tidak terdapat perbezaan yang signifikan ibadah dalam kalangan pelajar Politeknik Merlimau Melaka berdasarkan jantina dengan nilai F = 0.612 dan sig = 0.435 ($p>0.05$). Dari segi min menunjukkan bahawa pelajar lelaki (min = 4.30 dan sp = 0.49) mempunyai ibadah yang lebih tinggi berbanding dengan pelajar perempuan (min = 4.26 dan sp = 0.41). Namun, perbezaan tersebut tidak signifikan. Ini menunjukkan hipotesis nol (Ho1.1) adalah diterima.

Hasil kajian, pengkaji mendapati secara keseluruhan pengamalan ajaran Islam dalam aspek ibadah adalah sangat tinggi. Kategori adab dalam ibadah iaitu memulai makan dengan bacaan Bismillah adalah paling tinggi dan boleh dipuji. Kategori zakat, mandi wajib, hukum syariat Islam dan menonton rancangan televisyen berada pada tahap sederhana. Aspek solat diawal waktu berada pada tahap paling rendah. Bacaan ini adalah berdasarkan kategori dalam aspek ibadah. Namun secara keseluruhannya tahap pengamalan ajaran Islam dalam aspek ibadah juga berada pada tahap yang tinggi dan harus dipuji.

Dengan melazimi amalan kebaikan, seseorang itu akan terbiasa dengan perkara tersebut. Begitu juga dengan melaksanakan solat di awal waktu. Secara tidak langsung pelaziman mengamalkan solat diawal waktu akan membiasakan pelaksanannya. Justeru itu membiasakan diri dengan kebaikan akan mengarahkan seseorang itu melakukan perkara - perkara kebaikan dan akhirnya akan membentuk akhlak dan keperibadian seseorang. Bertepatan dengan teori Imam al-Ghazali yang menyatakan dengan melazimi melakukan amalan baik seseorang itu boleh menjadi seorang yang berakhlak. Selain itu dengan *muraqabatullah* atau pengawasan diri terhadap Allah SWT juga mampu membentuk seseorang menjadi insan soleh serta mampu mengawal dirinya dari melakukan perkara-perkara yang dilarang oleh Allah SWT. Sebagaimana dinyatakan dalam firmanNya:

يَٰٓأَيُّهَا ٱلَّذِينَ ءَامَنُواْ ٱتَّقُواْ ٱللَّهَ وَٱبۡتَغُوٓاْ إِلَيۡهِ ٱلۡوَسِيلَةَ وَجَٰهِدُواْ فِي سَبِيلِهِۦ لَعَلَّكُمۡ تُفۡلِحُون

"Wahai orang-orang yang beriman! Bertaqwalah kepada Allah dan carilah jalan yang mendekatkan diri kepada-Nya, dan berjihadlah pada jalan-Nya, supaya kamu mendapat keberuntungan."

(Ayat QS. Al-Ma'idah 35)

Dapatan kajian mendapati tidak terdapat perbezaan yang signifikan ibadah dalam kalangan pelajar Politeknik Merlimau Melaka berdasarkan jantina dengan nilai F = 0.612 dan sig = 0.435 (p>0.05). Dari segi min menunjukkan bahawa pelajar lelaki (min = 4.30 dan sp = 0.49) mempunyai ibadah yang lebih tinggi berbanding dengan pelajar perempuan (min = 4.26 dan sp = 0.41). Namun, perbezaan tersebut tidak signifikan. Ini menunjukkan hipotesis nol (Ho1.1) adalah diterima.

4. Kesimpulan

Secara keseluruhannya, dapatan kajian menunjukkan Pendidikan Islam yang dilaksanakan di PMM telah berjaya membimbing pelajar mengamalkan ajaran Islam dalam kehidupan seharian. Kajian ini diharapkan boleh dijadikan rujukan dan garis panduan untuk merancang dasar bagi penambahbaikan kursus tersebut dari masa ke semasa dan seterusnya memperkasakan lagi kursus Pendidikan Islam yang dilaksanakan khususnya di PMM.

Selari dengan teori Imam al-Ghazali, metodologi pendidikan dan pembentukan akhlak baginya haruslah bersifat teoritikal dan praktikal. Bagi beliau, kaedah pendidikan akhlak manusia haruslah bermula daripada peringkat bayi dan seterusnya berkembang hingga ke peringkat remaja, dewasa, dan lanjut usia (Suhid, 2009). Sebagaimana yang dinyatakan dalam hadith Nabi Muhammad SAW:

أَكْمَلُ الْمُؤْمِنِينَ إِيمَانًا أَحْسَنُهُمْ خُلُقًا

"Orang yang sempurna imannya ialah mereka yang paling baik akhlaknya"

(Riwayat Abu Daud)

Abstract

Incorporating gamification into education has shown promising results in increasing student engagement and improving learning outcomes. This paper explores the application of gamification strategies in teaching database subjects, focusing on how interactive play can enhance student motivation, comprehension and retention. By integrating game elements such as points, badges, leaderboards and problem-based challenges, students can develop a deeper understanding of complex database concepts. This study examines different gamification models, their effectiveness in database education and potential challenges in implementation. Through case studies and empirical research, this study highlights best practices for designing gamified learning experiences that foster critical thinking, problem solving and collaboration.
Keywords: Gamification; Database Learning; Educational Strategies

1. Introduction

In today's evolving educational landscape, traditional pedagogical approaches are increasingly being supplemented with digital innovations to meet the expectations and learning preferences of modern students. One such innovation is gamification, the use of game elements such as points, levels, leader boards and rewards in non-game contexts to motivate and engage learners. Numerous studies have reported that gamification can improve student engagement, motivation and knowledge retention, particularly in courses that involve abstract reasoning and complex problem-solving (Hakulinen & Auvinen, 2014).

However, many educational settings still rely heavily on passive, lecture-based methods especially in technically demanding subjects. One such subject is database fundamentals which forms a foundational component in computer science, data science and information technology curricula. Topics such as normalization, query optimization, indexing and relational schema design are essential but often perceived as abstract and difficult by students. As a result, learners may experience low motivation, disengagement and difficulty applying knowledge in real-world scenarios (Murray & Guimaraes, 2009; Connolly & Begg, 2007). Additionally, repetitive and non-interactive teaching approaches often lead to boredom and cognitive overload further hampering meaningful learning outcomes (Zainun Amirah Zainudin & Norehan Zulkiply, 2023).

Emerging research emphasizes the importance of adopting innovative instructional techniques that promote interactivity and real-world relevance. With advancements in educational technology, educators are better positioned to deliver engaging learning experiences through tools such as gamified learning platforms (Razali et al., 2020). While gamification has been successfully applied in general programming or computing education, its application in database education remains underexplored. Most existing studies do not tailor gamification to the specific cognitive and conceptual challenges inherent in database

learning. Furthermore, although database courses are typically introduced early in computing programs and are essential for foundational knowledge, they often lack the active learning components needed to reinforce theoretical understanding (Shang, 2016).

This study addresses this research gap by investigating how gamification can be effectively integrated into database instruction. It aims to explore the impact of gamified learning environments on student engagement, motivation and mastery of database concepts. By incorporating strategies such as level-based progression, problem-based scenarios, interactive SQL challenges and adaptive feedback mechanisms, the research proposes a gamified model tailored to the demands of database education.

The significance of this study lies in its contribution to both academic and instructional practices. It provides a structured framework for implementing gamification in database courses and offers empirical evidence on how game-based learning can enhance student comprehension, retention and application of knowledge. Ultimately, this research advocates for a pedagogical shift toward more interactive and personalized learning experiences that better align with the demands of 21st century technical education.

2. Methodology

This study employed a quantitative research design to examine the impact of gamification on student engagement and content mastery in database learning. A structured questionnaire served as the primary data collection instrument, consisting of closed-ended items developed in alignment with the research objectives. To ensure the reliability and validity of the instrument, it underwent expert review by academic professionals with experience in instructional design and educational technology. To assess internal consistency and transparency, a pilot study was conducted with a subset of the target group. The instrument was refined based on the feedback received.

The population for this study comprised 148 Semester 2 students from the Department of Information Technology and Communication (JTMK) at Politeknik Sultan Idris Shah, all of whom were enrolled in database related courses. According to Krejcie and Morgan's (1970) sample size determination table, the recommended sample size for this population is between 103 and 108 participants. A total of 106 students from three classes were selected through purposive sampling, ensuring that all respondents had participated in the gamified learning experience. The questionnaire was administered during class sessions by the course lecturer via Google Forms, providing a time-efficient and cost-effective means of data collection.

The gamified learning intervention was embedded within the database course and included features such as quest challenges, leader boards, achievement badges and timed missions. These elements were designed to encourage active participation and enhance student motivation and conceptual understanding. Upon completion of the intervention, responses were collected and analysed using IBM SPSS Statistics. Descriptive statistical methods including measures of central tendency and frequency distributions were employed to summarize the data.

3. Results and Discussion

The reliability of the instrument used in this study was evaluated using Cronbach's Alpha. The 20-items questionnaire focused on student's perceptions of gamification in database learning. The analysis yielded a Cronbach's Alpha of 0.984 indicating excellent internal consistency in Table 1.

Table 1. Reliability Statistics

Cronbach's Alpha	Number of Items
0.984	20

A total of 106 students completed the questionnaire. Descriptive statistics revealed that all 20 items recorded mean scores exceeding 4.0 on a 5-point Likert scale, indicating a high level of agreement among respondents. The highest rated item was Item 20 (M=4.38, SD=0.82), followed by Item 14 (M=4.34, SD=0.78). Standard deviations for all items ranged from 0.75 to 0.95, suggesting strong agreement and response consistency in Table 2.

Table 2. Summary of Student Perceptions Toward Gamification in Database Learning

No.	Items	Mean	Std. Deviation	Level
1	The gamified approach made learning database concepts more engaging.	4.23	0.95	High
2	Gamification increased motivation to study database-related topics.	4.23	0.84	High
3	Interactive play elements encouraged active participation in learning activities.	4.33	0.78	High
4	It was easier to stay focused when learning databases through gamification.	4.20	0.83	High
5	Gamification helped with understanding and retaining database concepts.	4.21	0.81	High
6	The use of game mechanics enhanced the learning experience.	4.30	0.81	High
7	The gamified learning experience-built confidence in applying database concepts.	4.22	0.80	High
8	Learning databases through gamification improved problem-solving and critical-thinking skills.	4.27	0.75	High
9	Gamified activities improved understanding of SQL queries	4.23	0.80	High
10	Learning database normalization through interactive challenges made the topic easier to grasp.	4.23	0.82	High
11	Gamification enhanced the ability to comprehend indexing and its importance.	4.21	0.80	High
12	Database transactions and concurrency control were easier to understand through gamified exercises.	4.15	0.84	High
13	The combination of storytelling, simulations, and challenges enhanced learning of database concepts.	4.20	0.79	High
14	Receiving instant feedback in gamified activities helped identify and correct mistakes.	4.34	0.78	High
15	Competitive elements encouraged improvement of database skills.	4.24	0.81	High
16	A structured gamified learning model improved long-term retention of database concepts.	4.17	0.87	High
17	Adaptive learning techniques enhanced the database learning experience.	4.21	0.81	High
18	Integration of interactive tutorials and hands-on challenges helps reinforce database knowledge.	4.23	0.81	High
19	A well-structured gamified system included progressive difficulty levels for database topics.	4.22	0.79	High
20	Gamified learning models for database subjects were recommended to future students.	4.38	0.82	High

A Pearson correlation analysis was conducted to examine the relationship between student engagement and mastery of database concepts. The results indicated a significant positive correlation, $r(104) = 0.74$, $p < 0.001$ suggesting that higher engagement levels were

associated with stronger perceptions of content mastery. Additionally, a one-way ANOVA was performed to assess whether perceptions of gamified learning differed across class sections (Class A, B and C). The analysis found no statistically significant differences, $F(2, 103) = 1.21$, $p=0.302$ indicating that the gamified approach was consistently effective across all groups.

The findings of this study support the effectiveness of gamification as a pedagogical strategy in database education. The high internal consistency of the questionnaire reinforces the validity of the instrument in capturing student's perceptions. The uniformly high mean scores across all items suggest that students responded positively to the gamified learning experience. These results align with existing literature indicating that gamification enhances motivation, engagement, and learning outcomes (Deterding et al., 2011; Hamari et al., 2014).

Students valued the interactive elements such as real-time feedback, achievement systems and challenge-based learning which likely contributed to increased focus and interest in complex database topics like SQL and normalization. The strong correlation between engagement and content mastery confirms that higher levels of interaction and enjoyment are linked with better perceived understanding and skill development. This supports cognitive theories that emphasize the role of emotional and motivational factors in effective learning (Deci & Ryan, 1985).

The absence of significant differences between class groups implies that the intervention was robust across varied classroom dynamics. This suggests that gamified strategies can be scaled or adapted across different student cohorts without compromising their effectiveness. While the results are promising some limitations should be acknowledged. The study relied on self-reported perceptions which may not fully reflect actual learning gains. Future research could incorporate objective assessments of knowledge retention or performance-based evaluations. Additionally, longitudinal studies could examine whether the positive effects of gamification persist over time.

4. Conclusion

This study substantiates the efficacy of gamification as a transformative pedagogical approach in database education. By integrating elements such as real-time feedback, progressive challenges and interactive problem-solving, the gamified model significantly enhanced student engagement, motivation and understanding of complex database topics including SQL, normalization and indexing. The high mean scores across all survey items along with student's strong endorsement of the approach, underscore its positive reception and practical value.

Statistical analysis revealed a strong positive correlation between engagement and content mastery ($r = 0.74$, $p < 0.001$) suggesting that gamified learning not only promotes active participation but also facilitates deeper cognitive processing and retention. The absence of significant differences across class groups further indicates the model's adaptability and effectiveness across diverse student cohorts.

In summary, this research contributes valuable insights into the pedagogical potential of gamification in technical education. It demonstrates that gamification can transform learning environments into more engaging and impactful experiences. Future work should investigate long term learning outcomes, explore integration with AI powered adaptive learning systems and examine its application across other academic and professional training contexts. The success of this model also opens promising pathways for commercialization as a scalable, modular platform or Learning Management System (LMS) integrated tool.

Abstrak

Kajian ini bertujuan untuk menilai impak pendedahan awal terhadap perisian Building Information Modeling (BIM) dan AutoCAD terhadap kebolehpasaran serta kesiapsiagaan kerjaya pelajar Pendidikan dan Latihan Teknikal dan Vokasional (TVET) di Malaysia. Perkembangan pesat dalam industri kejuruteraan menuntut kemahiran digital yang relevan, namun tahap pendedahan pelajar terhadap teknologi ini masih rendah. Dengan menggunakan pendekatan kuantitatif, seramai 120 pelajar TVET dalam bidang kejuruteraan telah dipilih sebagai responden bagi menilai hubungan antara pengalaman penggunaan perisian dengan kemahiran teknikal dan kebolehpasaran. Dapatan kajian menunjukkan bahawa terdapat hubungan positif yang signifikan antara penggunaan perisian BIM dan AutoCAD dengan kesiapsiagaan kerjaya pelajar. Analisis regresi linear berganda mengesahkan bahawa kemahiran perisian merupakan faktor yang paling dominan dalam menentukan tahap kebolehpasaran pelajar. Kajian ini menyokong Teori Pembelajaran Konstruktivisme yang menekankan pengalaman pembelajaran autentik dalam konteks dunia sebenar. Implikasinya, institusi TVET disarankan agar memperkukuh integrasi perisian berasaskan industri dalam kurikulum serta menyediakan latihan komprehensif kepada pensyarah. Kajian ini juga mencadangkan polisi pendidikan TVET yang lebih progresif selaras dengan kehendak Revolusi Industri 4.0. Secara keseluruhan, pendedahan awal terhadap BIM dan AutoCAD terbukti memberi impak positif dalam mempertingkatkan daya saing graduan TVET di pasaran kerja yang semakin mencabar.
Kata kunci : BIM; AutoCAD; TVET.

1. Pengenalan

Dalam dunia yang semakin global, teknologi semakin memainkan peranan yang penting dalam semua sektor industri, terutamanya dalam sektor kejuruteraan dan pembinaan. Penggunaan perisian canggih seperti Building Information Modeling (BIM) dan AutoCAD kini menjadi keperluan asas dalam proses perancangan, rekabentuk, dan pelaksanaan projek. BIM, sebagai perisian untuk merekabentuk, merancang, dan menguruskan maklumat bangunan, telah membolehkan pengurusan projek yang lebih efisien, manakala AutoCAD, yang lebih dikenali dalam lukisan teknik dan reka bentuk, memainkan peranan penting dalam menyokong keperluan projek kejuruteraan yang memerlukan ketepatan dan ketelitian.

Bagaimanapun, pendedahan terhadap teknologi ini di kalangan pelajar TVET (*Technical and Vocational Education and Training*) di Malaysia masih terhad. Walaupun terdapat usaha-usaha untuk mengintegrasikan penggunaan perisian tersebut dalam kurikulum pendidikan, jurang antara pengetahuan akademik dan keperluan industri masih wujud. Kebanyakan pelajar TVET tidak memiliki pengalaman praktikal dengan penggunaan perisian ini semasa mereka mengikuti kursus mereka, yang seterusnya memberi kesan terhadap kesiapsiagaan mereka untuk memasuki pasaran pekerjaan.

Perkembangan pesat dalam teknologi digital ini menuntut agar pelajar TVET dilengkapi dengan kemahiran yang sesuai untuk memenuhi tuntutan pasaran kerja yang semakin

kompetitif. Oleh itu, pendedahan awal terhadap perisian BIM dan AutoCAD dianggap penting dalam mempersiapkan graduan TVET untuk menghadapi cabaran ini. Kajian ini akan menilai impak pendedahan awal perisian BIM dan AutoCAD terhadap kesiapsiagaan kerjaya pelajar TVET, dengan fokus khusus kepada pelajar dalam bidang kejuruteraan.

Berdasarkan kajian yang ada, masih terdapat kekurangan pendedahan terhadap perisian BIM dan AutoCAD di kalangan pelajar TVET, khususnya dalam konteks pendidikan di Malaysia. Walaupun terdapat beberapa inisiatif untuk mengintegrasikan teknologi ini dalam kurikulum pendidikan, kajian yang mendalam mengenai hubungan antara pendedahan perisian ini dan kebolehpasaran pelajar masih terhad. Selain itu, terdapat keperluan mendesak untuk mengenal pasti sejauh mana pendedahan awal ini memberi kesan terhadap kemahiran teknikal pelajar dan bagaimana ia mempengaruhi kesiapsiagaan mereka untuk memasuki dunia pekerjaan. Pendedahan yang rendah terhadap perisian ini boleh menyebabkan pelajar kekurangan kemahiran yang diperlukan untuk bersaing dalam industri, yang mana banyak syarikat dan organisasi memerlukan graduan yang mahir dalam penggunaan perisian teknologi tinggi. Oleh itu, kajian ini bertujuan untuk mengisi jurang pengetahuan ini dan memberikan gambaran yang lebih jelas mengenai kesan pendedahan awal terhadap perisian BIM dan AutoCAD terhadap kesiapsiagaan kerjaya pelajar TVET.

Kajian ini bertujuan untuk menilai impak pendedahan awal terhadap perisian BIM dan AutoCAD terhadap kebolehpasaran dan kesiapsiagaan kerjaya pelajar TVET. Objektif khusus kajian ini adalah seperti berikut:

- Menganalisis tahap pendedahan pelajar TVET terhadap perisian BIM dan AutoCAD serta hubungan antara pengalaman penggunaan perisian ini dengan kebolehpasaran pelajar.
- Menilai pengaruh pendedahan terhadap kemahiran teknikal dan kebolehpasaran pelajar dalam sektor kejuruteraan.
- Mengkaji perbezaan antara pendedahan terhadap perisian BIM dan AutoCAD terhadap kesiapsiagaan kerjaya pelajar dalam industri.

Berdasarkan objektif yang telah dinyatakan, beberapa persoalan kajian yang akan dijawab adalah:

- Apakah kesan pendedahan awal terhadap perisian BIM dan AutoCAD terhadap kemahiran teknikal pelajar TVET?
- Bagaimanakah pendedahan terhadap perisian ini mempengaruhi kebolehpasaran pelajar dalam industri kejuruteraan?
- Apakah perbezaan yang wujud antara pengalaman penggunaan BIM dan AutoCAD terhadap kesiapsiagaan kerjaya pelajar TVET?

Kajian ini menggunakan pendekatan kuantitatif untuk menguji beberapa hipotesis berkaitan dengan hubungan antara pendedahan perisian dan kebolehpasaran pelajar. Hipotesis yang dicadangkan adalah seperti berikut:

- Hipotesis 1: Terdapat hubungan positif yang signifikan antara pengalaman penggunaan perisian BIM dengan kebolehpasaran pelajar TVET.
- Hipotesis 2: Terdapat hubungan positif yang signifikan antara pengalaman penggunaan perisian AutoCAD dengan kebolehpasaran pelajar TVET.
- Hipotesis 3: Pendedahan awal terhadap perisian BIM dan AutoCAD memberi kesan yang signifikan terhadap kesiapsiagaan kerjaya pelajar dalam industri kejuruteraan.

Kajian ini memberi sumbangan kepada teori dan amalan dalam bidang pendidikan teknikal, terutamanya dalam konteks TVET. Secara teorinya, kajian ini menyokong Teori Pembelajaran Konstruktivisme, yang menekankan bahawa pembelajaran lebih berkesan apabila pelajar terlibat dalam pengalaman yang relevan dengan dunia sebenar, seperti menggunakan perisian BIM dan AutoCAD.

Dari segi praktikal, kajian ini memberi implikasi besar kepada institusi pendidikan dan pembuat dasar, terutamanya dalam mengembangkan kurikulum yang lebih sesuai dengan keperluan industri. Keputusan kajian ini juga akan memberi panduan kepada pihak pengurusan pendidikan untuk merancang strategi yang lebih berkesan dalam meningkatkan kebolehpasaran pelajar TVET.

Kajian ini tertumpu kepada pelajar TVET di Malaysia, khususnya dalam bidang kejuruteraan. Skop kajian meliputi pengalaman penggunaan perisian BIM dan AutoCAD, serta penilaiannya terhadap kebolehpasaran dan kesiapsiagaan kerjaya. Batasan kajian ini termasuk hanya melibatkan pelajar yang mengikuti kursus TVET di institusi pendidikan terpilih di Malaysia, dan tidak melibatkan pelajar dari sektor lain atau negara luar. Definisi Operasional

- BIM (Building Information Modeling): Perisian yang digunakan untuk merancang, membina, dan menguruskan maklumat tentang struktur dan infrastruktur secara digital.
- AutoCAD: Perisian reka bentuk berkomputer yang digunakan untuk menghasilkan lukisan teknik dan reka bentuk 2D dan 3D.
- TVET: Pendidikan dan latihan yang memberi tumpuan kepada kemahiran teknikal dalam pelbagai bidang industri untuk menyediakan tenaga kerja yang mahir.
- Kebolehpasaran: Keupayaan graduan untuk mendapatkan pekerjaan dalam industri berkaitan dengan kemahiran yang mereka pelajari.

2. Metodologi

Kajian ini menggunakan pendekatan kuantitatif kerana objektif utamanya adalah untuk mengukur hubungan dan kesan pendedahan awal kepada perisian BIM dan AutoCAD terhadap tahap kesediaan kerjaya pelajar TVET. Pendekatan ini sesuai kerana ia membolehkan pengumpulan data dalam bentuk numerik yang boleh dianalisis secara statistik untuk menguji hipotesis dan mengenal pasti corak serta hubungan yang signifikan secara empirik. Pendekatan ini juga memberikan kebolehpercayaan yang tinggi melalui penggunaan instrumen yang dinilai dari aspek kesahan dan kebolehpercayaan. Reka bentuk kajian ini ialah kajian tinjauan (*survey research*). Kajian tinjauan dipilih kerana ia membolehkan penyelidik mendapatkan data secara menyeluruh daripada sejumlah besar responden dalam jangka masa yang singkat. Reka bentuk ini membolehkan penilaian terhadap tahap pendedahan teknologi dan tahap kesediaan kerjaya secara deskriptif dan inferensi.

Populasi kajian terdiri daripada pelajar awal tahun program TVET dalam bidang kejuruteraan awam, seni bina dan mekanikal di tiga institusi latihan vokasional di Malaysia yang telah terdedah kepada latihan menggunakan perisian BIM dan AutoCAD.Sampel kajian melibatkan seramai 120 pelajar yang dipilih menggunakan teknik pensampelan bertujuan (purposive sampling). Teknik ini dipilih kerana hanya pelajar yang mempunyai pengalaman langsung dalam penggunaan perisian BIM dan AutoCAD layak untuk memberikan maklumat yang relevan dengan objektif kajian. Syarat penyertaan termasuk pengalaman sekurang-kurangnya satu semester dengan perisian berkenaan dan pernah menyertai latihan praktikal industri. Instrumen utama dalam kajian ini ialah soal selidik berstruktur yang dibangunkan berdasarkan literatur terdahulu dan disesuaikan dengan konteks pelajar TVET Malaysia. Soal selidik ini mengandungi tiga bahagian:

- Demografi pelajar (umur, kursus, institusi, pengalaman BIM/AutoCAD)
- Tahap pendedahan kepada perisian BIM dan AutoCAD
- Tahap kesediaan kerjaya (merangkumi dimensi kemahiran teknikal, komunikasi, pemikiran kritikal, dan kebolehpasaran)

Instrumen ini diuji kesahan kandungan (content validity) melalui semakan oleh tiga orang pakar dalam bidang TVET dan pendidikan kejuruteraan. Ujian kebolehpercayaan (reliability test) dijalankan melalui ujian rintis (pilot study) ke atas 30 responden. Nilai Cronbach's Alpha

bagi setiap konstruk berada dalam julat 0.78 hingga 0.89, menunjukkan tahap kebolehpercayaan yang tinggi. Data dianalisis menggunakan perisian SPSS versi 25. Analisis merangkumi:

- Statistik deskriptif: min, sisihan piawai, peratusan – bagi menggambarkan latar belakang responden dan tahap pendedahan/persepsi mereka.
- Ujian korelasi Pearson: untuk menguji hubungan antara pendedahan awal kepada perisian dengan tahap kesediaan kerjaya.
- Ujian regresi linear berganda: untuk menilai sejauh mana faktor pendedahan terhadap BIM dan AutoCAD boleh meramalkan kesediaan kerjaya pelajar.

Pemilihan SPSS adalah berdasarkan keupayaannya untuk mengendalikan data kuantitatif secara efisien dan memberikan hasil yang mudah ditafsirkan dalam bentuk statistik inferensi dan deskriptif yang relevan untuk kajian berskala sederhana seperti ini. Berdasarkan tinjauan literatur ini, satu model kerangka konseptual dicadangkan untuk mengkaji hubungan antara pendedahan awal terhadap perisian BIM dan AutoCAD dengan kebolehpasaran pelajar TVET rajah 1. Model ini mencadangkan bahawa pendedahan terhadap kedua-dua perisian ini akan memberi kesan langsung terhadap kemahiran teknikal pelajar. Kemahiran teknikal yang diperoleh melalui penggunaan perisian ini kemudiannya mempengaruhi kesiapsiagaan kerjaya pelajar, yang seterusnya meningkatkan kebolehpasaran mereka di pasaran kerja.

Dalam model ini, terdapat beberapa pemboleh ubah yang akan diuji, termasuk pengalaman penggunaan perisian, kemahiran teknikal yang diperoleh, dan tahap kesiapsiagaan kerjaya pelajar. Model ini diharapkan dapat memberikan gambaran yang lebih jelas tentang bagaimana pendedahan awal terhadap perisian ini berhubung dengan kebolehpasaran pelajar dalam industri kejuruteraan dan pembinaan.

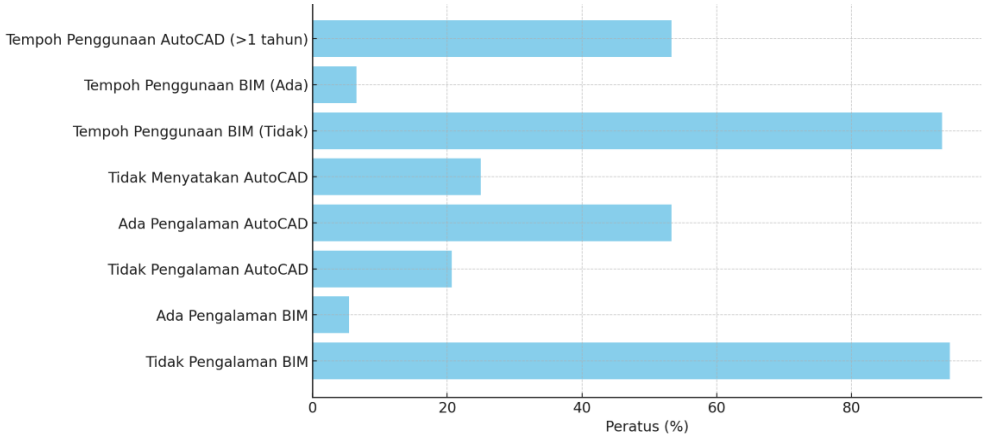
Rajah 1. Model Kerangka Konseptual pendedahan perisian

3. Dapatan dan Perbincangan

Bahagian ini akan membentangkan dapatan utama yang diperoleh melalui analisis data mengenai pendedahan awal terhadap perisian BIM dan AutoCAD, serta kesannya terhadap kebolehpasaran dan kesiapsiagaan kerjaya pelajar TVET. Analisis statistik deskriptif dijalankan bagi menggambarkan profil responden kajian, termasuklah latar belakang demografik mereka seperti umur, jantina, dan pengalaman dalam penggunaan perisian BIM dan AutoCAD.

Sebanyak 92 responden telah terlibat dalam kajian ini, terdiri daripada pelajar TVET dalam bidang kejuruteraan dari beberapa institusi pengajian tinggi di Malaysia. Dari segi jantina, 60%

responden adalah lelaki dan 40% adalah wanita. Umur responden pula adalah antara 18 hingga 25 tahun, dengan purata umur 21 tahun. Menurut data yang diperoleh, sebanyak 94.6% responden melaporkan bahawa mereka tidak mempunyai pengalaman dengan perisian BIM, sementara 5.4% lagi mempunyai pengalaman dengan perisian ini. Sebaliknya, untuk perisian AutoCAD, 53.3% pelajar melaporkan mempunyai pengalaman dengan perisian ini, sementara 20.7% tidak mempunyai pengalaman dan 25% lagi tidak memberikan sebarang jawapan rajah 2. Data ini menunjukkan bahawa walaupun penggunaan AutoCAD lebih meluas, perisian BIM masih kurang dikenali dan digunakan dalam kalangan pelajar TVET, yang menunjukkan kekurangan pendedahan terhadap teknologi yang lebih baru dalam industri kejuruteraan. Selain itu, majoriti pelajar yang mempunyai pengalaman dengan AutoCAD melaporkan telah menggunakan perisian tersebut lebih dari setahun, manakala untuk BIM, majoriti pelajar yang terlibat dalam kajian ini tidak mempunyai pengalaman langsung dengan perisian tersebut.



Rajah 2. Perbandingan pengalaman perisian BIM dan Autocad

Setelah menjalankan ujian statistik deskriptif, langkah seterusnya adalah untuk menilai hubungan antara pendedahan terhadap perisian BIM dan AutoCAD dengan kesediaan kerjaya pelajar melalui ujian inferensi. Ujian korelasi Pearson digunakan untuk menilai hubungan antara pemboleh ubah-pemboleh ubah utama, iaitu pengalaman penggunaan perisian dan tahap kesiapsiagaan pelajar untuk memasuki dunia pekerjaan. Dapatan ujian korelasi menunjukkan bahawa terdapat hubungan positif yang signifikan antara pendedahan terhadap perisian BIM dengan kesiapsiagaan kerjaya pelajar. Nilai korelasi antara pengalaman menggunakan BIM (B1) dan kesiapsiagaan kerjaya (C1) adalah r = 0.409 dengan nilai p 0.000. Ini menunjukkan bahawa semakin tinggi pengalaman penggunaan perisian BIM, semakin tinggi pula tahap kesiapsiagaan kerjaya pelajar untuk memasuki pasaran pekerjaan. Begitu juga dengan perisian AutoCAD, terdapat hubungan positif yang signifikan dengan kesiapsiagaan kerjaya, dengan nilai korelasi r = 0.316 dan p 0.002. Kajian ini juga menunjukkan bahawa kemahiran dalam perisian, seperti yang diwakili oleh pemboleh ubah B6 (kemahiran perisian), mempunyai korelasi yang sangat kuat dengan kesiapsiagaan kerjaya pelajar (C7). Nilai korelasi yang diperoleh adalah r = 0.435 dan p 0.000, yang menunjukkan bahawa penguasaan kemahiran dalam perisian sangat mempengaruhi kebolehpasaran dan kesiapsiagaan pelajar untuk memasuki dunia pekerjaan.

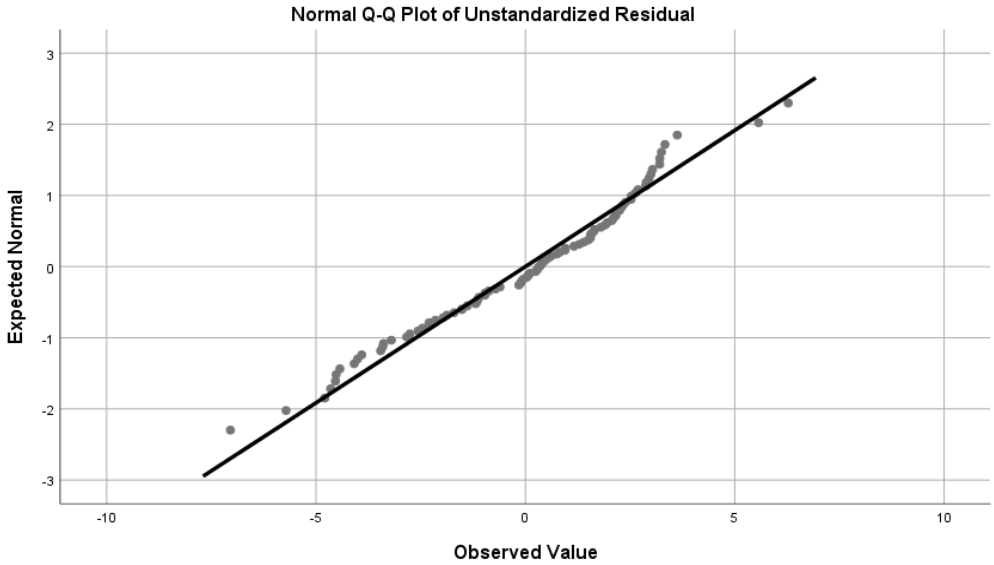
Setelah menilai hubungan antara pemboleh ubah-pemboleh ubah melalui korelasi, analisis regresi linear berganda dilakukan untuk mengenal pasti pemboleh ubah yang paling mempengaruhi kebolehpasaran pelajar. Model regresi ini menunjukkan bahawa sebanyak 41.4% variasi dalam kebolehpasaran pelajar (JUMC) dapat dijelaskan oleh pendedahan terhadap perisian BIM dan AutoCAD, yang diwakili oleh model dengan nilai $R^2 = 0.414$. Dalam model regresi ini, kemahiran perisian (B6) menunjukkan kesan yang paling besar terhadap kebolehpasaran pelajar dengan koefisien beta 0.435 dan nilai p <0.001 rujuk Jadual 1. Ini menunjukkan bahawa kemahiran dalam menggunakan perisian adalah faktor yang sangat

penting dalam meningkatkan kebolehpasaran pelajar. Dapatan ini menunjukkan bahawa pelajar yang lebih mahir dalam menggunakan perisian BIM dan AutoCAD lebih bersedia untuk memasuki dunia pekerjaan berbanding pelajar yang tidak mempunyai kemahiran ini.

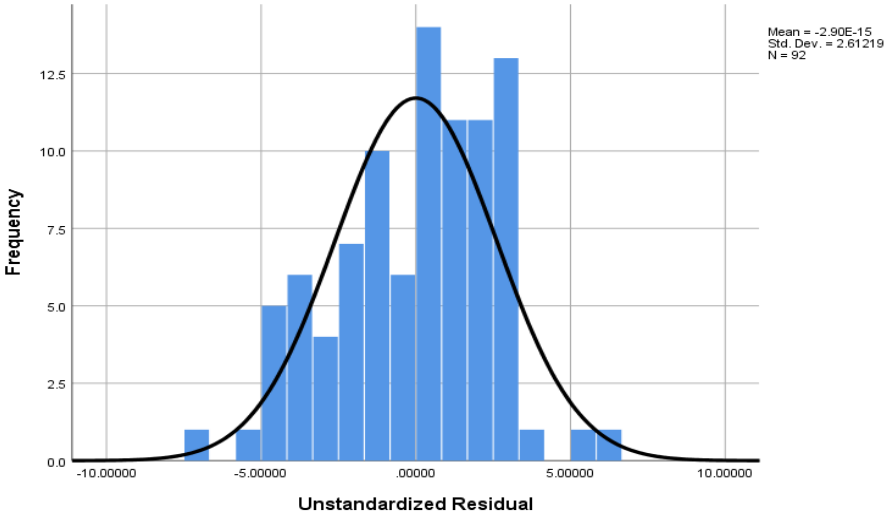
Jadual 1. Analisis regresi linear berganda antara Pendedahan Perisian (B1-B6) dengan kesediaan Kerjaya (JUMC)

Pemboleh Ubah Bebas	B (Unstandardized)	Std. Error	Beta (Standardized)	t	Sig.
(Konstan)	13.654	2.601	–	5.249	0
B1	0.639	0.408	0.153	1.566	0.121
B2	0.149	0.404	0.036	0.369	0.713
B3	0.728	0.381	0.18	1.908	0.06
B4	0.554	0.386	0.125	1.433	0.155
B5	-0.003	0.395	-0.001	-0.007	0.994
B6	1.681	0.364	0.435	4.613	0

Keputusan daripada kedua-dua Q-Q Plot rajah 3 dan Histogram menunjukkan bahawa data residual mengikuti taburan normal rajah 4. Ini mengesahkan bahawa andaian asas untuk regresi linear dipenuhi dan model yang dibina adalah sah. Kedua-dua ujian ini penting kerana ia memastikan bahawa analisis yang digunakan untuk menilai hubungan antara pendedahan pelajar terhadap perisian BIM dan AutoCAD dengan kebolehpasaran mereka adalah tepat dan boleh dipercayai.



Rajah 3. Normal Q-Q plot dengan kefahaman residual



Rajah 4. Histogram data resedual mengikuti taburan normal

Bagi memastikan kesahihan model regresi yang dibina, ujian normaliti dilakukan dengan menggunakan ujian Kolmogorov-Smirnov. Keputusan ujian menunjukkan nilai p 0.098, yang lebih besar daripada paras signifikan 0.05, menandakan bahawa residual daripada model regresi adalah normal. Ini menunjukkan bahawa model regresi yang digunakan adalah sah dan dapat diterima untuk analisis lebih lanjut. Selain itu, ujian kebolehpercayaan menggunakan Cronbach's Alpha dijalankan ke atas instrumen kajian untuk memastikan keandalan soal selidik yang digunakan. Nilai Cronbach's Alpha yang diperoleh adalah 0.777, yang menunjukkan bahawa instrumen kajian ini mempunyai kebolehpercayaan yang baik dan sesuai digunakan untuk kajian ini. Berdasarkan analisis heatmap rujuk rajah 5 korelasi antara item kesediaan kerjaya (C1–C7) dan pendedahan perisian (B1–B6), didapati bahawa hubungan antara kedua-dua pembolehubah adalah secara umumnya lemah dan tidak konsisten. Beberapa item menunjukkan hubungan positif lemah seperti antara C1 dan B1 (r = 0.23), C4 dan B4 (r = 0.29), serta C2 dan B6 (r = 0.28), manakala satu hubungan negatif sederhana dikesan antara C1 dan B4 (r = -0.41). Dapatan ini mencadangkan bahawa terdapat pengaruh yang minimum antara tahap pendedahan kepada perisian dengan kesediaan kerjaya pelajar. Justeru, kajian lanjutan disarankan untuk menilai faktor-faktor lain yang mungkin lebih dominan mempengaruhi kesediaan kerjaya, serta memahami konteks hubungan negatif yang dikesan secara lebih mendalam.

Rajah 5. *Heatmap* Kolerasi antara item kesediaan kerjaya dan pendedahan Perisian

Secara keseluruhan, hasil kajian ini menunjukkan bahawa pendedahan awal terhadap perisian BIM dan AutoCAD mempunyai impak yang signifikan terhadap kebolehpasaran dan kesiapsiagaan kerjaya pelajar TVET. Penemuan ini selari dengan kajian yang dijalankan oleh Garousi et al. (2018) yang menekankan bahawa penguasaan perisian BIM sangat relevan dalam meningkatkan peluang pekerjaan graduan dalam bidang kejuruteraan. Penguasaan perisian ini bukan sahaja membantu pelajar dalam meningkatkan kemahiran teknikal, tetapi juga mempersiapkan mereka untuk menghadapi cabaran industri yang semakin berteknologi tinggi. Oleh itu, kajian ini menyarankan agar institusi pendidikan TVET di Malaysia memperkenalkan dan memperluaskan penggunaan perisian ini dalam kurikulum mereka untuk memastikan graduan lebih bersedia untuk memasuki pasaran pekerjaan.

4. Kesimpulan

Kajian ini bertujuan menilai impak pendedahan awal terhadap perisian Building Information Modeling (BIM) dan AutoCAD terhadap kebolehpasaran serta kesiapsiagaan kerjaya pelajar TVET. Dapatan utama menunjukkan wujud hubungan signifikan antara pendedahan kepada perisian ini dengan tahap kesiapsiagaan pelajar memasuki pasaran kerja. Analisis deskriptif mendapati AutoCAD lebih meluas digunakan berbanding BIM, namun penggunaan BIM masih rendah dalam kalangan pelajar TVET. Walau demikian, pengalaman menggunakan kedua-dua perisian terbukti memberi kesan langsung terhadap kemahiran teknikal pelajar, sekali gus meningkatkan kebolehpasaran mereka. Ujian korelasi Pearson mendapati hubungan positif signifikan antara pengalaman menggunakan BIM dan AutoCAD dengan kesiapsiagaan kerjaya pelajar. Hasil ini selari dengan kajian Garousi et al. (2018) yang menekankan pentingnya kemahiran teknikal dalam meningkatkan peluang pekerjaan graduan kejuruteraan. Analisis regresi linear berganda juga menunjukkan bahawa penguasaan perisian merupakan pemboleh ubah paling mempengaruhi kebolehpasaran, dengan koefisien beta yang tinggi.

Dari sudut teori, dapatan ini menyokong Teori Pembelajaran Konstruktivisme yang menegaskan pengalaman praktikal sebagai asas pembelajaran berkesan. Pendedahan kepada perisian BIM dan AutoCAD membolehkan pelajar mengaplikasikan pengetahuan dalam konteks sebenar, sekali gus meningkatkan kemahiran teknikal dan kesiapsiagaan kerjaya. Mohammed dan Kinyo (2020) turut menekankan bahawa penglibatan aktif dalam pembelajaran praktikal bukan sahaja memperkukuh pemahaman pelajar, malah mempersiapkan mereka menghadapi cabaran dunia pekerjaan. Pendedahan kepada teknologi moden seperti BIM juga memberi kelebihan kepada pelajar TVET dalam menyesuaikan diri dengan industri pembinaan yang semakin canggih. Garousi et al. (2018) menegaskan bahawa penguasaan BIM adalah kritikal untuk memastikan graduan mempunyai kemahiran relevan, manakala Mesaros et al. (2020) menunjukkan BIM membantu meningkatkan kualiti projek pembinaan serta mempercepatkan proses kerja. Namun, kajian ini turut mendapati jurang penggunaan antara AutoCAD dan BIM. AutoCAD lebih popular, tetapi BIM dilihat lebih canggih serta relevan dengan kehendak industri. Oleh itu, pendidikan TVET perlu menambah baik pengajaran agar pelajar lebih terdedah kepada teknologi moden ini. Dapatan ini menyokong teori konstruktivisme bahawa pembelajaran berasaskan pengalaman teknologi dapat meningkatkan keberkesanan pendidikan teknikal.

Implikasinya, institusi pendidikan perlu mengintegrasikan lebih banyak latihan praktikal menggunakan perisian terkini. Latihan industri yang memberi peluang pelajar mengaplikasikan pengetahuan dalam situasi sebenar wajar diperluas. Pensyarah juga perlu diberi latihan berkala agar lebih efektif dalam pengajaran (Hassan et al., 2021). Bagi pembuat dasar, dapatan ini menyoroti keperluan mengemas kini dasar pendidikan TVET agar lebih menekankan teknologi terkini. Kerajaan perlu menyediakan dana untuk melengkapkan institusi dengan perisian moden serta melatih tenaga pengajar. Sebagai cadangan, peningkatan akses kepada perisian perlu diperkasa melalui kerjasama dengan syarikat teknologi untuk menyediakan lesen perisian percuma atau bersubsidi. Selain itu, kajian lanjutan boleh meneroka perisian lain seperti Revit atau SketchUp, serta melibatkan institusi

pendidikan berbeza untuk gambaran menyeluruh. Kesimpulannya, pendedahan awal kepada BIM dan AutoCAD memberi impak positif terhadap kebolehpasaran dan kesiapsiagaan kerjaya pelajar TVET. Pendidikan teknikal perlu terus mengadaptasi teknologi terkini bagi memastikan graduan lebih kompetitif dalam pasaran pekerjaan.

Abstrak

Kajian ini bertujuan untuk mengenal pasti persepsi pensyarah terhadap proses penggubalan soalan pentaksiran berterusan di Kolej Komuniti Seberang Jaya, meliputi tiga aspek utama iaitu tahap kefahaman, cabaran yang dihadapi, serta sokongan yang diperlukan. Seramai 29 orang pensyarah terlibat sebagai responden kajian melalui borang soal selidik yang dibina berdasarkan skala Likert lima mata. Dapatan menunjukkan bahawa tahap kefahaman pensyarah terhadap proses penggubalan soalan berada pada tahap tinggi dimana min berada di antara 4.07 hingga 4.31, manakala pelbagai cabaran turut dikenal pasti seperti kekangan masa, kekurangan rujukan rasmi, dan keperluan semakan rakan sebaya dengan min antara 4.07 hingga 4.52. Selain itu, pensyarah menyatakan keperluan terhadap pelbagai bentuk sokongan seperti latihan berkala, panduan rasmi, contoh soalan berkualiti dan penubuhan kumpulan pakar min antara 4.34 hingga 4.52. Kajian ini mencadangkan agar pihak pengurusan menyediakan sokongan berstruktur bagi memastikan keberkesanan dan kualiti penggubalan soalan pentaksiran berterusan yang sejajar dengan hasil pembelajaran kursus.
Kata kunci: Persepsi pensyarah; Penggubalan soalan; Pentaksiran berterusan.

1. Pengenalan

Pentaksiran berterusan merupakan komponen penting dalam sistem pendidikan tinggi yang berperanan untuk menilai kefahaman, kecekapan dan pencapaian pelajar secara berperingkat sepanjang tempoh pembelajaran (Ahmad et al., 2021). Di Kolej Komuniti, termasuk Kolej Komuniti Seberang Jaya, pendekatan ini selari dengan falsafah pendidikan berteraskan kemahiran dan kompetensi, di mana proses penilaian perlu mencerminkan perkembangan holistik pelajar secara berterusan, bukan semata-mata pada akhir kursus. Penggubalan soalan pentaksiran berterusan yang berkualiti bukan sekadar memenuhi keperluan kurikulum, tetapi turut mencerminkan pemahaman pensyarah terhadap hasil pembelajaran kursus (CLO), taksonomi aras kognitif, dan kehendak standard penilaian seperti yang digariskan oleh Agensi Kelayakan Malaysia (MQA, 2019). Keberkesanan soalan yang digubal amat bergantung kepada keupayaan pensyarah untuk menyesuaikan item penilaian dengan aras kemahiran pelajar serta hasil pembelajaran yang ingin dicapai (Rahman & Samad, 2020). Justeru, penggubalan yang sistematik dan berpandukan prinsip penilaian yang sahih sangat diperlukan.

Walau bagaimanapun, dalam amalan sebenar, pensyarah sering berdepan dengan pelbagai cabaran seperti kekangan masa, kekurangan rujukan atau latihan, serta ketidakpastian terhadap format dan kriteria penilaian (Zulkifli & Jamaludin, 2022). Kajian lepas menunjukkan bahawa masih wujud jurang antara pengetahuan teori tentang pentaksiran dengan pelaksanaan praktikal dalam bilik darjah, terutamanya dalam kalangan pensyarah pendidikan teknikal dan vokasional (TVET) (Ahmad et al., 2021). Bagi Kolej Komuniti Seberang Jaya, usaha ke arah penambahbaikan kualiti penggubalan soalan amat kritikal, lebih-lebih lagi

dalam memastikan keseragaman dan kebolehpercayaan pentaksiran antara kursus dan jabatan. Kelemahan dalam aspek ini boleh memberi kesan langsung kepada integriti akademik serta pencapaian pelajar secara keseluruhan. Oleh itu, kajian ini dijalankan untuk mengenal pasti persepsi pensyarah terhadap tahap pemahaman, cabaran, serta keperluan penambahbaikan berkaitan proses penggubalan soalan pentaksiran berterusan. Dapatan kajian dijangka dapat memberi input bermakna kepada Unit Peperiksaan Kolej Komuniti Seberang Jaya dalam merancang strategi sokongan yang lebih berkesan dan bersasar.

Penggubalan soalan pentaksiran berterusan yang berkualiti merupakan aspek kritikal dalam menjamin keberkesanan sistem penilaian akademik di institusi pendidikan tinggi, termasuk Kolej Komuniti. Di Kolej Komuniti Seberang Jaya, pensyarah memainkan peranan utama dalam merancang, menggubal dan melaksanakan pentaksiran yang seharusnya sejajar dengan keperluan kurikulum, hasil pembelajaran kursus (CLO), dan aras kognitif pelajar. Namun begitu, terdapat petunjuk awal bahawa tahap pemahaman dalam kalangan pensyarah berkaitan prinsip dan garis panduan penggubalan soalan masih belum seragam dan menyeluruh. Kajian terdahulu (Ahmad et al., 2021; Rahman & Samad, 2020) menunjukkan bahawa pensyarah institusi TVET sering menghadapi cabaran seperti kekangan masa, kurang latihan khusus, kekeliruan terhadap format dan ketidaktentuan aras soalan yang sesuai. Situasi ini turut dilaporkan berlaku di institusi Kolej Komuniti, termasuk di Seberang Jaya, yang menimbulkan persoalan tentang tahap kesediaan dan kefahaman sebenar pensyarah dalam menggubal instrumen pentaksiran yang sahih dan boleh dipercayai. Lebih membimbangkan, ketiadaan mekanisme semakan rakan sebaya atau sokongan sistematik daripada Unit Peperiksaan boleh membawa kepada ketidakseimbangan kualiti soalan antara kursus dan jabatan. Sekiranya isu ini tidak ditangani secara menyeluruh, ia boleh menjejaskan integriti akademik, keadilan penilaian pelajar dan akhirnya menurunkan reputasi institusi. Justeru, kajian ini dijalankan bagi mengenal pasti tahap pemahaman pensyarah, mengenal pasti cabaran sebenar yang dihadapi, serta meneroka keperluan penambahbaikan yang boleh dilaksanakan oleh pihak pengurusan peperiksaan di Kolej Komuniti Seberang Jaya. Dapatan kajian dijangka mampu menyokong pembangunan sistem pentaksiran yang lebih mantap, sistematik dan berkesan pada masa hadapan.

Kajian ini dihasilkan bagi mencapai tiga objektif yang berikut:

- Mengenal pasti tahap pemahaman pensyarah terhadap proses penggubalan soalan pentaksiran berterusan di Kolej Komuniti Seberang Jaya.
- Mengenal pasti cabaran yang dihadapi oleh pensyarah dalam proses penggubalan soalan pentaksiran berterusan.
- Mengenal pasti keperluan penambahbaikan dalam proses pengurusan dan sokongan oleh Unit Peperiksaan bagi meningkatkan kualiti penggubalan soalan pentaksiran.

Pentaksiran berterusan adalah alat penting dalam pendidikan tinggi untuk menilai kemajuan pelajar sepanjang kursus. Di Kolej Komuniti Seberang Jaya, ia memainkan peranan besar dalam memastikan pelajar menguasai bukan sahaja teori, tetapi juga kemahiran praktikal yang diperlukan dalam dunia industri (Ahmad et al., 2021). Dalam konteks ini, pensyarah perlu menggubal soalan yang mencabar dan selaras dengan hasil pembelajaran kursus menggunakan taksonomi Bloom (Rahman & Samad, 2020). Namun, kajian menunjukkan bahawa pensyarah sering menghadapi cabaran dalam menggubal soalan pentaksiran yang berkesan. Abdullah dan Razak (2018) menjelaskan bahawa banyak pensyarah TVET belum sepenuhnya menguasai prinsip penggubalan soalan beraras tinggi, yang menyebabkan ketidakseimbangan dalam penilaian. Zulkifli dan Jamaludin (2022) juga mendapati bahawa kekurangan latihan rasmi menyukarkan pensyarah untuk menghasilkan soalan yang berkualiti dan sesuai dengan hasil pembelajaran.

Cabaran lain termasuk kekangan masa, beban kerja yang tinggi, dan kurangnya sokongan daripada pihak pengurusan akademik. Pensyarah memerlukan sokongan yang lebih baik

dalam bentuk latihan berterusan dan semakan soalan (Noraini et al., 2022). Latihan yang lebih sistematik dan penggunaan teknologi dalam pembangunan soalan boleh membantu pensyarah menghasilkan pentaksiran yang lebih efektif dan konsisten. Secara keseluruhannya, literatur menunjukkan bahawa walaupun pentaksiran berterusan penting di Kolej Komuniti, ia masih berdepan dengan beberapa cabaran yang perlu ditangani untuk meningkatkan kualiti penilaian.

Kajian ini dijalankan dengan matlamat untuk memberikan sumbangan yang signifikan kepada peningkatan mutu pentaksiran berterusan di Kolej Komuniti, khususnya dari sudut penggubalan soalan oleh pensyarah. Terdapat tiga pihak utama yang akan menerima manfaat langsung daripada dapatan kajian ini:

- Kajian ini membantu pensyarah mengenal pasti tahap kefahaman dan amalan mereka dalam penggubalan soalan pentaksiran berterusan. Ia membuka ruang kepada peningkatan profesional melalui latihan, semakan rakan sebaya, dan pemantapan penggunaan taksonomi Bloom secara efektif.
- Kajian ini menyediakan maklumat penting untuk Unit Peperiksaan dalam menilai keperluan latihan, menyediakan garis panduan penggubalan soalan yang standard, dan menambah baik proses semakan serta kualiti pentaksiran di peringkat kolej.
- Kajian ini juga memberi impak pada peringkat sistemik dengan menyediakan data empirikal yang boleh dijadikan rujukan oleh Bahagian Peperiksaan dan Penilaian JPPKK dalam merangka dasar, modul latihan, dan intervensi peningkatan kualiti pentaksiran. Penemuan kajian ini boleh dijadikan asas kepada pembentukan kerangka penilaian nasional yang lebih mampan, sejajar dengan keperluan TVET masa kini yang menekankan pembelajaran berasaskan hasil (OBE).

2. Metodologi

Kajian ini menggunakan pendekatan kuantitatif dengan reka bentuk tinjauan deskriptif bagi meneliti persepsi pensyarah terhadap penggubalan soalan pentaksiran berterusan di Kolej Komuniti Seberang Jaya. Pendekatan ini dipilih kerana ia membolehkan penyelidik mengumpulkan data secara sistematik daripada kumpulan responden yang spesifik, seterusnya membuat penilaian berdasarkan pola dan kecenderungan yang diperoleh (Creswell, 2014). Reka bentuk tinjauan ini amat sesuai digunakan dalam kajian yang melibatkan penerokaan tahap kefahaman, cabaran yang dihadapi serta keperluan atau sokongan yang diperlukan dalam kalangan pensyarah. Populasi kajian terdiri daripada semua pensyarah yang sedang berkhidmat di Kolej Komuniti Seberang Jaya, khususnya mereka yang terlibat secara langsung dalam penggubalan soalan bagi pentaksiran berterusan. Pensampelan dilakukan secara bertujuan bagi memastikan hanya pensyarah yang relevan dan mempunyai pengalaman dalam penggubalan soalan dinilai. Dijangkakan seramai 29 orang pensyarah akan menjadi responden dalam kajian ini. Instrumen utama kajian ialah borang soal selidik yang dibina berdasarkan tiga objektif utama kajian. Soal selidik ini terbahagi kepada empat bahagian, iaitu Bahagian A yang mengumpul maklumat demografi, Bahagian B yang menilai tahap kefahaman pensyarah terhadap penggubalan soalan pentaksiran, Bahagian C yang meneliti cabaran yang dihadapi oleh pensyarah, dan Bahagian D yang mengenal pasti bentuk sokongan yang diperlukan untuk mempertingkat proses penggubalan. Item-item dalam Bahagian B hingga D menggunakan skala Likert lima mata bagi membolehkan responden menyatakan tahap persetujuan mereka secara lebih terperinci (Joshi et al., 2015).

Pengumpulan data akan dilaksanakan secara atas talian menggunakan platform Google Form. Soal selidik akan diedarkan kepada responden melalui aplikasi Telegram dan e-mel rasmi institusi dengan tempoh respon selama satu minggu. Peringatan berkala akan dihantar bagi memastikan kadar respons yang memuaskan. Keselamatan dan kerahsiaan data responden akan dijaga sepenuhnya sepanjang tempoh kajian ini dijalankan. Data yang

diperoleh akan dianalisis menggunakan perisian IBM Statistical Package for the Social Sciences (SPSS) versi 27.0. Kaedah analisis yang digunakan ialah statistik deskriptif, termasuk pengiraan min, peratusan dan sisihan piawai bagi setiap bahagian utama soal selidik. Kaedah ini dipilih kerana ia bersesuaian dengan objektif kajian yang bersifat penerokaan dan penilaian umum terhadap persepsi, cabaran serta keperluan sokongan. Bagi memastikan kesahan dan kebolehpercayaan instrumen soal selidik, ujian kebolehpercayaan (reliability test) akan dijalankan melalui pengiraan pekali Alpha Cronbach, dengan nilai $\alpha \geq 0.7$ diterima sebagai tahap kebolehpercayaan yang memuaskan. Kajian ini akan dilaksanakan dengan mematuhi prinsip etika penyelidikan, termasuk mendapatkan persetujuan dimaklumkan daripada semua responden, menjaga kerahsiaan maklumat, dan memastikan data digunakan hanya untuk tujuan akademik dan penyelidikan semata-mata.

3. Dapatan dan Perbincangan

Seramai 29 orang pensyarah Kolej Komuniti Seberang Jaya telah terlibat sebagai responden dalam kajian ini. Daripada jumlah tersebut, 58.6% adalah lelaki dan 41.4% adalah perempuan. Dari segi umur, majoriti responden berada dalam lingkungan umur 41 hingga 50 tahun (86.2%), manakala selebihnya berumur antara 31 hingga 40 tahun (10.3%) dan 51 tahun ke atas (3.4%). Berdasarkan program pengajaran, hampir separuh daripada responden mengajar dalam program Sijil Teknologi Elektrik (48.3%), diikuti oleh Sijil Teknologi Maklumat (20.7%), Diploma in Electronics (Instrumentation) (17.2%) dan Pengajian Umum (13.8%). Kesemua responden mempunyai pengalaman mengajar lebih daripada 10 tahun, menunjukkan bahawa dapatan kajian diperoleh daripada pensyarah yang berpengalaman luas. Selain itu, 93.1% daripada mereka pernah menghadiri bengkel penggubalan soalan, manakala hanya 6.9% tidak pernah mengikutinya. Jadual 1 dibawah menunjukkan kekerapan dan peratusan responden yang terlibat dalam kajian ini.

Jadual 1. Profil Responden

Demografi	Kategori Respondan	Kekerapan	Peratusan
Jantina	Lelaki	17	58.60%
	Perempuan	12	41.40%
Umur	31 – 40 tahun	3	10.30%
	41 – 50 tahun	25	86.20%
	51 tahun ke atas	1	3.40%
Program	Sijil Teknologi Elektrik	14	48.30%
	Diploma in Electronics (Instrumentation)	5	17.20%
	Sijil Teknologi Maklumat	6	20.70%
	Pengajian Umum	4	13.80%
Pengalaman Mengajar	Lebih 10 tahun	29	100%
Pernah Menghadiri bengkel penggubalan soalan	ya	27	93.1%
	Tidak	2	6.9%

Ujian kebolehpercayaan telah dijalankan bagi menentukan sejauh mana konsistensi dalaman item-item soal selidik yang dibina. Nilai pekali Alpha Cronbach digunakan sebagai petunjuk utama, di mana nilai $\alpha \geq 0.70$ dianggap menunjukkan tahap kebolehpercayaan yang memuaskan dan boleh diterima (Sekaran & Bougie, 2016). Instrumen ini terdiri daripada tiga konstruk utama selaras dengan objektif kajian seperti Jadual 2 dibawah:

Jadual 2. Analisa kebolehpercayaan

Objektif	Bil. Item	Alpha Cronbach (α)	Tahap Kebolehpercayaan
Kefahaman tentang penggubalan soalan	10	0.804	Tinggi
Cabaran dalam penggubalan soalan	10	0.760	Memuaskan
Keperluan penambahbaikan dan sokongan	10	0.805	Tinggi

Kesemua nilai Alpha Cronbach melebihi nilai minimum 0.70, sekali gus menunjukkan bahawa item-item dalam setiap konstruk mempunyai konsistensi dalaman yang baik. Maka, instrumen ini dianggap sah dari segi kebolehpercayaan dan sesuai digunakan untuk tujuan kajian ini. Bagi mencapai objektif ini, sebanyak 10 item soal selidik telah digunakan untuk menilai tahap kefahaman pensyarah terhadap aspek-aspek utama dalam penggubalan soalan pentaksiran berterusan. Nilai min ≥ 3.68 dianggap sebagai tahap tinggi (Mohd Majid Konting, 2005) dijadikan sebagai rujukan didalam kajian ini bagi menentukan interpretasi terhadap soalan kajian. Jadual 3 menunjukkan nilai min dan sisihan piawai tahap kefahaman pensyarah Kolej Komuniti Seberang Jaya terhadapat penggubalan soalan.

Jadual 3. Tahap Kefahaman Terhadap Penggubalan Soalan

Bil	Item	Min	Sisihan Piawai (SP)	Interpretasi
1	Saya memahami konsep pentaksiran berterusan.	4.17	0.38	Tinggi
2	Saya jelas tentang keperluan menggubal soalan mengikut hasil pembelajaran kursus (CLO).	4.14	0.44	Tinggi
3	Saya faham tentang penggunaan aras Taksonomi Bloom dalam penggubalan soalan.	4.10	0.67	Tinggi
4	Saya mampu membezakan soalan aras rendah, sederhana dan tinggi.	4.21	0.41	Tinggi
5	Saya boleh menggubal soalan yang sah dan boleh dipercayai.	4.14	0.35	Tinggi
6	Saya mempunyai pengetahuan mencukupi untuk membina rubrik pemarkahan.	4.21	0.49	Tinggi
7	Saya sentiasa merujuk panduan rasmi dalam menggubal soalan.	4.07	0.45	Tinggi
8	Saya memahami konsep kesukaran dan keberkesanan soalan.	4.31	0.66	Tinggi
9	Saya mengetahui perbezaan antara soalan formatif dan sumatif.	4.14	0.35	Tinggi
10	Saya yakin dengan kemahiran penggubalan saya.	4.17	0.46	Tinggi

Dapatan menunjukkan bahawa tahap kefahaman pensyarah terhadap proses penggubalan soalan adalah tinggi, dengan semua item mencatatkan nilai min melebihi 4.00. Ini mencerminkan tahap kesedaran dan penguasaan yang baik dalam kalangan pensyarah terhadap prinsip asas penggubalan soalan. Item yang memperoleh nilai min tertinggi ialah *"Saya memahami konsep kesukaran dan keberkesanan soalan"* (Min = 4.31, SP = 0.66), menunjukkan bahawa pensyarah mempunyai kefahaman yang kukuh terhadap aspek penilaian kesukaran dan keberkesanan item soalan yang digubal. Selain itu, dua item lain yang mencatatkan nilai min yang tinggi ialah *"Saya mampu membezakan soalan aras rendah, sederhana dan tinggi"* (Min = 4.21, SP = 0.41) dan *"Saya mempunyai pengetahuan mencukupi untuk membina rubrik pemarkahan"* (Min = 4.21, SP = 0.49). Ini menunjukkan bahawa pensyarah bukan sahaja memahami taksonomi penilaian, malah bersedia membina instrumen pemarkahan yang sesuai. Namun, item *"Saya sentiasa merujuk panduan rasmi dalam menggubal soalan"* mencatatkan nilai min paling rendah (Min = 4.07, SP = 0.45). Walaupun nilai ini masih berada dalam kategori tinggi, ia menunjukkan bahawa amalan merujuk dokumen panduan mungkin tidak dilakukan secara konsisten oleh semua pensyarah.

Ini merupakan satu aspek yang wajar diberi perhatian oleh pihak pengurusan dalam bentuk pengukuhan garis panduan atau penyediaan sumber rujukan yang lebih mudah diakses.
Analisis deskriptif keseluruhan menunjukkan nilai min keseluruhan ialah 4.16 dengan sisihan piawai 0.28. Nilai ini menunjukkan tahap kefahaman yang tinggi dikalangan pensyarah. Skor minimum direkodkan pada 3.70 manakala maksimum ialah 4.90, dengan taburan yang konsisten dan sisihan piawai yang rendah, menunjukkan keseragaman tahap pemahaman pensyarah. Secara keseluruhannya, hasil ini menunjukkan bahawa pensyarah mempunyai pemahaman yang baik dalam proses penggubalan soalan. Walau bagaimanapun, pelaksanaan latihan berterusan dan bimbingan teknikal masih diperlukan bagi meningkatkan kualiti dan ketepatan penggubalan soalan selaras dengan kehendak kurikulum dan memenuhi piawaian.

Objektif kedua ini adalah untuk mengenal pasti tahap cabaran yang dihadapi oleh pensyarah dalam proses penggubalan soalan pentaksiran berterusan. Sebanyak sepuluh item telah digunakan bagi mengukur persepsi responden terhadap aspek cabaran tersebut. Analisis deskriptif menunjukkan bahawa kesemua item memperoleh min melebihi 4.00, yang menunjukkan tahap persepsi yang tinggi terhadap semua cabaran yang diukur. Jadual 4 dibawah menunjukkan cabaran yang dihadapi oleh pensyarah Kolej Komuniti Seberang Jaya dalam proses penggubalan soalan.

Jadual 4. Cabaran Terhadap Proses Penggubalan Soalan

No	Pernyataan	Min	Sisihan Piawai	Interpretasi
1	Saya mempunyai masa yang mencukupi untuk menggubal soalan berkualiti.	4.34	0.55	Tinggi
2	Saya mempunyai akses kepada bahan rujukan rasmi semasa menggubal soalan.	4.52	0.50	Tinggi
3	Saya dapat memastikan soalan yang saya gubal selaras dengan hasil pembelajaran.	4.41	0.50	Tinggi
4	Saya sentiasa menerima semakan rakan sebaya secara konsisten.	4.48	0.50	Tinggi
5	Saya telah menerima latihan khusus berkaitan penggubalan soalan.	4.34	0.48	Tinggi
6	Saya jelas tentang format piawai yang perlu digunakan.	4.07	0.37	Tinggi
7	Saya berupaya menggubal soalan aras tinggi.	4.10	0.40	Tinggi
8	Saya mendapat bimbingan dan sokongan yang mencukupi daripada pihak pengurusan.	4.28	0.45	Tinggi
9	Saya mempunyai akses kepada bank soalan terdahulu.	4.41	0.50	Tinggi
10	Saya terlibat secara aktif dalam proses pemurnian atau penjaminan kualiti.	4.34	0.48	Tinggi

Item yang mencatatkan skor min tertinggi ialah *"Saya mempunyai akses kepada bahan rujukan rasmi semasa menggubal soalan"* dengan min 4.52, menunjukkan bahawa kemudahan bahan rujukan sangat membantu pensyarah dalam penggubalan soalan. Manakala item dengan skor min paling rendah ialah *"Saya jelas tentang format piawai yang perlu digunakan"* dengan min 4.07, yang menunjukkan keperluan untuk penjelasan atau garis panduan yang lebih jelas mengenai format standard yang perlu dipatuhi.
Dapatan ini menunjukkan bahawa walaupun cabaran dalam proses penggubalan soalan adalah tinggi, kebanyakan pensyarah telah dilengkapi dengan sokongan dan sumber yang diperlukan. Walau bagaimanapun, aspek pemahaman terhadap format piawai dan keupayaan menggubal soalan aras tinggi masih boleh dipertingkatkan melalui latihan dan bimbingan teknikal berterusan. Secara keseluruhan, nilai min bagi aspek cabaran yang dikaji adalah 4.33 dengan sisihan piawai 0.27, menunjukkan tahap persepsi yang tinggi dan konsisten dalam kalangan pensyarah terhadap cabaran yang dihadapi dalam penggubalan soalan pentaksiran berterusan.

Objektif ketiga dalam kajian ini menumpukan kepada keperluan penambahbaikan dan sokongan yang diperlukan oleh pensyarah dalam melaksanakan proses penggubalan soalan dengan berkesan. Terdapat sepuluh item yang digunakan untuk menilai objektif ini. Kesemua skor min bagi pernyataan yang dikaji adalah melebihi 4.30, menunjukkan tahap keperluan dan sokongan yang diperlukan adalah tinggi dalam proses penggubalan soalan.

Jadual 5. Tahap Keperluan Sokongan dalam Proses Penggubalan Soalan

No	Pernyataan	Min	Sisihan Piawai	Interpretasi
1	Saya memerlukan latihan berkala dalam penggubalan soalan.	4.41	0.50	Tinggi
2	Saya perlukan garis panduan rasmi daripada Unit Peperiksaan.	4.45	0.57	Tinggi
3	Saya perlukan templat atau format rasmi untuk penggubalan soalan.	4.48	0.50	Tinggi
4	Saya ingin akses kepada contoh soalan berkualiti tinggi.	4.48	0.57	Tinggi
5	Saya menyokong pelaksanaan semakan rakan sebaya secara berkala.	4.48	0.50	Tinggi
6	Saya perlukan bengkel teknikal berkaitan taksonomi Bloom.	4.38	0.49	Tinggi
7	Saya mencadangkan penubuhan kumpulan pakar mata pelajaran (SME).	4.45	0.50	Tinggi
8	Saya sokong pemantapan sistem audit dalaman kualiti soalan.	4.38	0.49	Tinggi
9	Saya ingin adanya saluran sokongan atau mentoring penggubalan.	4.34	0.48	Tinggi
10	Saya harap JPPKK menyediakan latihan/kursus penggubalan soalan.	4.52	0.50	Tinggi

Hasil dari dapatan yang diperoleh, min tertinggi direkodkan ialah pada item *"Saya harap JPPKK menyediakan latihan penggubalan soalan"* (min = 4.52), menggambarkan harapan besar pensyarah terhadap peranan pihak atasan dalam menyediakan latihan atau kursus berkaitan penggubalan soalan secara lebih berkala. Begitu juga, pernyataan berkaitan keperluan kepada garis panduan, format rasmi, contoh soalan dan semakan rakan sebaya turut menunjukkan min yang tinggi (4.45 ke atas). Berdasarkan analisis deskriptif, nilai min keseluruhan yang diperoleh adalah 4.43 dengan sisihan piawai 0.31. Ini menunjukkan bahawa tahap sokongan yang dirasakan oleh pensyarah berada pada paras yang tinggi dan agak konsisten merentas responden. Keputusan ini menunjukkan bahawa pensyarah amat memerlukan ekosistem sokongan yang menyeluruh merangkumi latihan, garis panduan, teknikal, dan penyeliaan bagi memastikan kualiti penggubalan soalan berada pada tahap optimum. Penubuhan kumpulan pakar mata pelajaran dan sistem audit dalaman juga dilihat sebagai antara keperluan penting dalam meningkatkan kualiti pentaksiran.

4. Kesimpulan

Kajian ini telah mengenal pasti tahap pengetahuan, cabaran yang dihadapi, dan bentuk sokongan yang diperlukan oleh pensyarah dalam proses penggubalan soalan bagi pentaksiran berterusan di Kolej Komuniti Seberang Jaya. Dapatan menunjukkan bahawa secara keseluruhannya, pensyarah memiliki tahap pengetahuan yang tinggi terhadap aspek asas penggubalan soalan, terutamanya berkaitan pemahaman format dan keperluan selarasan dengan hasil pembelajaran.

Namun begitu, kajian turut mendedahkan bahawa terdapat cabaran signifikan yang dihadapi, antaranya adalah kekangan masa, kekurangan bahan rujukan rasmi, serta keperluan kepada bimbingan dan semakan yang lebih sistematik. Walaupun tahap persepsi terhadap cabaran ini adalah tinggi, ia tidak menggambarkan kelemahan mutlak pensyarah, sebaliknya mencerminkan keperluan terhadap persekitaran sokongan yang lebih kukuh.

Seterusnya, analisis terhadap objektif ketiga menunjukkan bahawa pensyarah mempunyai keperluan tinggi terhadap pelbagai bentuk sokongan termasuk latihan berkala, garis panduan rasmi, akses kepada soalan contoh, dan penubuhan kumpulan pakar mata pelajaran (SME). Sokongan teknikal seperti bengkel taksonomi Bloom, saluran mentoring dan sistem audit dalaman turut dikenalpasti sebagai aspek penting bagi meningkatkan mutu soalan yang dibangunkan. Secara keseluruhan, kajian ini menegaskan pentingnya peranan pihak pengurusan institusi dalam menyediakan sokongan berstruktur dan berterusan kepada pensyarah. Penemuan ini boleh dijadikan asas dalam merangka strategi peningkatan kualiti penggubalan soalan pentaksiran yang lebih efektif, sekaligus memastikan keberkesanan proses pembelajaran dan penilaian di peringkat Kolej Komuniti.

Abstrak

Kajian ini menggunakan pendekatan reka bentuk pembangunan *(design and development research),* yang dilaksanakan dalam beberapa peringkat utama. Setelah dapatan daripada kajian awal diperoleh melalui pemerhatian dan maklum balas pelajar terhadap prototaip awal, proses reka bentuk model dimulakan. Model-model struktur modular *(Industrilised Building Services)* IBS direka bentuk semula berdasarkan input awal bagi meningkatkan kefungsian, kebolehfahaman, dan kesesuaian dalam konteks pembelajaran bilik darjah. Seterusnya, komponen-komponen model dicetak menggunakan teknologi pencetakan 3D, mengikut spesifikasi reka bentuk yang telah dimuktamadkan. Bahan cetakan dipilih berdasarkan ciri mesra pengguna, ringan, dan tahan lama agar sesuai digunakan oleh pelajar di pelbagai peringkat. Model akhir kemudian digunakan dalam sesi pembelajaran sebenar, di mana pelajar diberi peluang untuk meneroka komponen IBS secara interaktif dan *hands-on*. Aktiviti ini bertujuan untuk mengukuhkan kefahaman pelajar melalui pendekatan visual dan manipulatif berbanding kaedah teori semata-mata. Bagi memudahkan penggunaan di dalam dan luar bilik darjah, semua komponen model ini akhirnya disusun dan ditempatkan dalam satu kit khusus agar mudah dibawa oleh tenaga pengajar dan pelajar. Dapatan menunjukkan bahawa majoriti responden menunjukkan peningkatan kefahaman terhadap komponen struktur, reka bentuk dan aplikasi praktikal sistem IBS selepas menggunakan kit ini. Nilai min keseluruhan adalah 2.9, menunjukkan tahap penerimaan sederhana tetapi positif. Kit ini berpotensi sebagai alat bantu pembelajaran berkesan dalam bilik darjah, dengan penekanan kepada pendekatan secara *hands-on* dan visual. Kajian ini mencadangkan penggunaan meluas kit seumpama ini dalam kurikulum TVET untuk meningkatkan pemahaman pelajar terhadap sistem binaan moden.
Kata kunci: Modular; IBS; Kit.

1. Pengenalan

Zaman era globalisasi dan perkembangan pesat industri pembinaan, pendekatan pengajaran dan pembelajaran dalam bidang teknikal perlu disesuaikan agar lebih berkesan serta relevan dengan keperluan semasa. Sistem Binaan Berindustri atau *Industrialized Building System* (IBS) merupakan salah satu pendekatan pembinaan moden yang semakin mendapat perhatian dalam industri pembinaan Malaysia. Oleh itu, pendedahan awal terhadap konsep IBS dalam institusi Pendidikan Teknikal dan Latihan Vokasional (TVET) adalah sangat penting bagi melahirkan tenaga kerja yang kompeten dan bersedia menghadapi kehendak industri (CIDB, 2020).

Walaupun konsep IBS sering diajar secara teori, Lam et al. (2024) menyarankan bahawa elemen seperti video pembelajaran yang efektif dan sistem model pembelajaran interaktif adalah faktor kejayaan utama yang sangat relevan dalam memperkukuh kefahaman pelajar melalui visualisasi dan aplikasi praktikal. Oleh itu, inovasi dalam bentuk alat bantu mengajar yang lebih interaktif dan berfokus kepada pendekatan amali amat diperlukan di dalam kelas.

Sebagai respon terhadap keperluan tersebut, satu kit pembelajaran inovatif yang dinamakan *Modular Assemble Learning Kit* (MoAL Kit) telah dibangunkan. Kit ini direka bentuk bagi membantu pelajar memahami konsep IBS secara lebih mendalam melalui pengalaman pembelajaran yang lebih visual, fizikal dan berstruktur. Kajian ini bertujuan untuk mereka bentuk serta menilai keberkesanan awal penggunaan MoAL Kit sebagai alat bantu mengajar di institusi TVET. Melalui pendekatan kajian kes, kit ini diuji terhadap sekumpulan kecil responden bagi menilai kefahaman terhadap konsep IBS selepas menggunakan kit tersebut.

Menurut Gloria Ajit et al. (n.d.), perubahan dalam kemajuan teknologi dan daya saing pasaran kerja telah membawa kepada perubahan dalam sistem pendidikan, bagi membolehkan generasi muda memperoleh pengetahuan dan kemahiran yang diperlukan untuk berjaya dalam ekonomi global masa kini. Rahman et al. meneliti penggunaan bahan bantu mengajar teknologi dalam kelas Elektronik di Kolej Vokasional Malaysia. Walaupun banyak guru menggunakan projek, komputer dan projektor, penggunaan bahan bantu dalam talian masih di tahap sederhana atau rendah. Kajian mencadangkan peningkatan bahan yang interaktif dan menarik bagi meningkatkan pemahaman pelajar dan motivasi pembelajaran. Oleh itu, kajian ini dijalankan bagi membangunkan satu kit pembelajaran IBS yang lebih sesuai dan boleh digunakan secara efektif dalam bilik darjah di sekolah menengah vokasional.

2. Metodologi

2.1 Rekabentuk Kajian

Kajian ini menggunakan pendekatan kajian tindakan yang melibatkan pembangunan dan penilaian awal terhadap inovasi Moal KIT sebagai bahan bantu mengajar. Pendekatan ini dipilih bagi membolehkan inovasi dinilai secara langsung dalam konteks pengajaran dan pembelajaran. Selain itu, kajian turut melibatkan pemerhatian awal terhadap penggunaannya dalam kalangan pelajar sekolah menengah sebagai satu langkah permulaan untuk menilai potensi kit tersebut dalam menarik minat pelajar terhadap bidang pembinaan.

a. Prosedur Kajian

Moal KIT dibangunkan berdasarkan pendekatan *design thinking*, yang merangkumi lima peringkat iaitu: *empathize, k*enal pasti masalah sebenar melalui temu bual dengan pelajar. Kedua ialah *define*, rumuskan keperluan pembelajaran yang dilihat. Ketiga ialah *Ideate*, menghasilkan idea reka bentuk kit berasaskan bahan interaktif dan berskala kecil berbanding dengan saiz asal. Keempat ialah *prototype:* mencipta versi awal kit menggunakan skala rekabentuk yang telah ditetapkan. Peringkat terakhir ialah *test*: menguji kit bersama pelajar sasaran dan mengumpul maklum balas responden.

b. Prototaip

Setelah reka bentuk konsep dikenalpasti dalam fasa *Ideate*, langkah seterusnya adalah membina prototaip awal kit. Prototaip ini direka bentuk dengan mengambil kira kebolehannya untuk diubah suai mengikut kehendak pereka serta mampu menghasilkan bentuk yang menyerupai komponen asal. Bahan-bahan yang digunakan adalah mudah didapati, selamat, ringan dan mudah alih. Selain itu, pembinaan prototaip turut melibatkan penggunaan pencetak 3D serta elemen interaktif seperti kod QR yang dipautkan kepada animasi ringkas atau video panduan. Reka bentuk kit ini merangkumi model miniatur IBS yang modular, yang dibangunkan berdasarkan elemen utama dalam sistem binaan seperti panel dinding, tiang, dan sambungan struktur bagunan.

Pembangunan prototaip ini bertujuan untuk menghasilkan gambaran sebenar bagaimana kit akan berfungsi dalam sesi pengajaran dan pembelajaran. Semasa fasa ini, beberapa semakan dalaman dilakukan bersama tenaga pengajar untuk memastikan reka bentuk, susun

atur, dan kandungan kit sejajar dengan sukatan pelajaran serta tahap kognitif pelajar yang disasarkan.

2.4 Pengujian Kit

Kajian ini dilaksanakan dalam dua fasa utama, iaitu Fasa Pembangunan Kit dan Fasa Ujian Rintis (*Pilot Test*). Peringkat fasa pembangunan, kajian literatur telah dijalankan terlebih dahulu bagi mengenal pasti keperluan pedagogi serta konsep asas berkaitan *Industrialized Building System* (IBS). Hasil daripada kajian ini menjadi asas kepada reka bentuk kit pembelajaran yang dinamakan *Modular Assemble Learning Kit* (MoAL Kit).

Seterusnya, dalam fasa ujian rintis (*Pilot Test*), kit ini diuji bersama sekumpulan kecil pelajar sekolah menengah yang berada di aliran teknikal, terdiri daripada lebih 30 orang. Aktiviti pengujian dijalankan dalam suasana pembelajaran sebenar, di mana pelajar diberi tugasan menggunakan kit tersebut untuk membina model IBS secara berperingkat. Pemerhatian secara langsung dilakukan untuk menilai interaksi dan tahap kefahaman pelajar terhadap komponen IBS yang dipelajari. Selain itu, temu bual pendek dan maklum balas lisan turut dikumpulkan bagi mendapatkan pandangan pelajar berkaitan kebolehgunaan, kefahaman, dan keberkesanan kit sebagai alat bantu mengajar.

2.5 Kaedah Pengumpulan Data

Bagi tujuan pengumpulan data, dua kaedah utama telah digunakan iaitu pemerhatian langsung dan maklum balas lisan. Pemerhatian langsung dilaksanakan bagi melihat bagaimana pelajar berinteraksi dengan MoAL Kit semasa aktiviti pembelajaran dijalankan. Melalui kaedah ini, penyelidik dapat mengenal pasti tahap kefahaman pelajar terhadap komponen IBS yang dibina serta cara mereka menyusun dan memasang kit tersebut secara praktikal. Selain itu, borang maklum balas ringkas dan sesi temu bual tidak formal turut dijalankan bagi mendapatkan komen, cadangan dan pengalaman pelajar sepanjang menggunakan kit. Maklumat yang diperoleh ini membantu dalam penilaian awal keberkesanan kit dari sudut kefahaman konsep serta kesesuaian reka bentuknya untuk digunakan dalam kalangan pelajar sekolah.

2.6 Kaedah Analisis Data

Data yang dikumpulkan daripada borang maklum balas dan pemerhatian dianalisis secara deskriptif menggunakan perisian Microsoft Excel. Analisis ini melibatkan pengiraan kekerapan, peratusan dan purata bagi menilai tahap kefahaman pelajar serta keberkesanan awal penggunaan MoAL Kit dalam aktiviti pembelajaran. Selain itu, maklum balas terbuka yang diterima dianalisis secara kualitatif melalui pengecaman tema utama yang berulang bagi mendapatkan gambaran umum terhadap persepsi dan pengalaman pelajar menggunakan kit ini.

3. Dapatan dan Perbincangan

Bab ini membentangkan hasil dapatan kajian yang diperoleh melalui data yang telah dikumpul daripada responden yang terlibat. Analisis data ini merangkumi analisis demografi serta analisis ke atas maklum balas berkaitan keberkesanan dan kefungsian kit yang dibangunkan. Hasil analisis ini akan menjadi asas kepada penilaian dan cadangan penambahbaikan terhadap kit pembelajaran agar lebih sesuai digunakan dalam konteks pendidikan TVET.

Jadual 1. Dapatan demografi responden

Perkara		Bilangan	Peratus %
Jantina	Lelaki	22	61
	Perempuan	14	39
Umur	12-14 tahun	5	14
	15-17 tahun	17	47
	18-20 tahun	11	31
	21-23 tahun	0	0
	24-26 tahun	0	0
	>26 tahun	3	8
Status	Sekolah Menengah	22	61
	Kolej Vokasional	11	31
	Bekerja	3	8

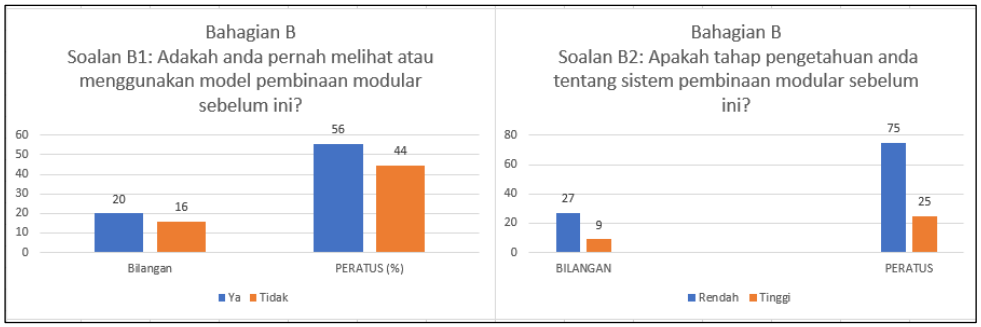
Berdasarkan analisis demografi dari Jadual 1., majoriti responden terdiri daripada pelajar lelaki iaitu seramai 22 orang (61%) berbanding 14 orang perempuan (39%). Dari segi umur, kumpulan terbesar adalah dalam lingkungan 15 hingga 17 tahun (47%), diikuti oleh 18 hingga 20 tahun (31%) dan 12 hingga 14 tahun (14%), manakala selebihnya (8%) berumur melebihi 26 tahun. Dari aspek status, kebanyakan responden merupakan pelajar sekolah menengah (61%), diikuti oleh pelajar kolej vokasional (31%) dan selebihnya bekerja (8%). Dapatan ini menunjukkan bahawa kajian ini lebih tertumpu kepada pelajar di peringkat sekolah menengah dan vokasional, sejajar dengan sasaran utama pembangunan kit pembelajaran yang dinilai.

Jadual 2. Interpretasi Skor Min Skala Likert Empat Mata

Skor Min	Interpretasi Min
1.00 - 1.50	Sangat Rendah
1.51 - 2.50	Rendah
2.51 - 3.50	Sederhana
3.51 - 4.00	Tinggi

Mohd Asri Harun et al., 2016

Menurut Mohd Asri Harun et al., 2016, penggunaan skala empat mata fleksibel dan jelas dimana skala ini memaksa responden memilih sama ada berada di pihak positif atau negatif tanpa pilihan neutral; responden perlu "ambil pendirian". Ini menjadikan data lebih bermakna dalam konteks pengukuran sikap atau persepsi secara jelas. Dalam kajian ini, skala likert ini digunakan untuk menilai tahap persetujuan responden terhadap item-item yang dikemukakan. Skor min bagi setiap item dianalisis bagi menentukan tahap penerimaan atau persepsi responden terhadap kit pembelajaran dan model yang dibangunkan. Skor min antara 1.00 hingga 1.50 ditafsirkan sebagai sangat rendah, 1.51 hingga 2.50 sebagai rendah, 2.51 hingga 3.50 sebagai sederhana, dan 3.51 hingga 4.00 sebagai tinggi. Panduan ini digunakan untuk menganalisis dan mentafsir tahap penerimaan responden terhadap setiap item dalam Bahagian B dan C.



Rajah 1. Dapatan item bahagian B

Berdasarkan dapatan B1 di Rajah 1., sebanyak 56% responden (20 orang) menyatakan bahawa mereka pernah melihat atau menggunakan model pembinaan modular, manakala 44% (16 orang) menyatakan sebaliknya. Ini menggambarkan bahawa konsep modular bukanlah sesuatu yang asing sepenuhnya dalam kalangan responden, namun masih terdapat sebilangan besar (hampir separuh) yang belum terdedah kepada model ini. Bagi soalan B2 pula, sebanyak 75% responden (27 orang) mengakui bahawa tahap pengetahuan mereka terhadap sistem pembinaan modular adalah rendah, manakala hanya 25% (9 orang) yang menyatakan tahap pengetahuan mereka tinggi. Dapatan ini menekankan keperluan untuk menyediakan bahan pembelajaran dan latihan yang sesuai untuk meningkatkan kefahaman serta pengetahuan teknikal berkaitan sistem ini. Nilai min bagi bahagian B ialah sebanyak 2.7.

Jadual 3. Item Bahagian C

Item / Soalan	Tahap	Bilangan	Peratus	Min
1. Aspek Struktur Bangunan				
Soalan 6: Saya faham fungsi elemen struktur asas dalam sesebuah bangunan modular.	Tidak Setuju	9	25	2.8
	Setuju	27	75	
Soalan 7: Saya boleh mengenal pasti komponen utama struktur dalam model pembinaan modular.	Tidak Setuju	15	42	2.7
	Setuju	21	58	
Soalan 8: Saya tahu bagaimana elemen struktur disambung antara satu sama lain dalam sistem modular.	Tidak Setuju	13	36	2.8
	Setuju	23	64	
2. Aspek Rekabentuk				
Soalan 9: Saya faham bagaimana rekabentuk modular dapat disesuaikan dengan keperluan pengguna.	Tidak Setuju	14	39	2.7
	Setuju	22	61	
Soalan 10: Saya boleh membezakan rekabentuk modular dengan rekabentuk konvensional.	Tidak Setuju	13	36	2.8
	Setuju	23	64	
Soalan 11: Saya tahu bagaimana rekabentuk mempengaruhi proses pemasangan modular.	Tidak Setuju	12	33	2.8
	Setuju	24	67	

Item / Soalan	Tahap	Bilangan	Peratus	Min
3. Aspek Kesesuaiaan/ Praktikaliti				
Soalan 12:	Tidak Setuju	8	22	3.1
Model prototaip ini membantu saya memahami konsep pembinaan modular dengan lebih jelas.	Setuju	28	78	
Soalan 13:	Tidak Setuju	5	14	3.2
Saya berpendapat model ini sesuai digunakan untuk tujuan pendidikan/ pemahaman asas sistem bangunan.	Setuju	31	86	
Soalan 14:	Tidak Setuju	11	31	3.1
Saya dapat bayangkan bagaimana model ini diaplikasikan dalam projek sebenar.	Setuju	25	69	

Jadual 4. Purata min bahagian C

Aspek Item	Soalan	Min	Min Keseluruhan
Struktur Bangunan	S6	2.8	2.9
	S7	2.7	
	S8	2.8	
Rekabentuk	S9	2.7	
	S10	2.8	
	S11	2.8	
Kesesuaian Model/ Praktikaliti	S12	3.1	
	S13	3.3	
	S14	3.1	

Berdasarkan dapatan dalam Bahagian C, nilai min aspek struktur bangunan (2.8), reka bentuk (2.7) dan kesesuaian/praktikaliti (2.8) menunjukkan tahap penilaian yang berada di skala sederhana. Ini selari dengan beberapa kajian terdahulu yang memberi justifikasi teori atas pembinaan model dan penilaian reka bentuk secara seimbang.

Berdasarkan kajian oleh Schwarz et al. (2009) dan Berland et al. (2016), kriteria utama untuk penilaian model termasuklah kejelasan struktur, fungsi komunikasi reka bentuk, serta kesesuaian model dengan tujuan berorientasikan kefahaman dan penggunaan praktikal dalam konteks pendidikan. Ini menyokong dapatan nilai min yang mencerminkan persepsi sederhana terhadap struktur, reka bentuk dan kegunaan model anda.

Selain itu, Pluta et al. (2011) menemui bahawa ciri-ciri seperti kejelasan representasi visual, kebolehfahaman reka bentuk, dan fungsi penerangan model merupakan penilaian kritikal yang sering diberi perhatian dalam penilaian model secara kuantitatif. Nilai min yang didapati melalui tinjauan ini mendekati tahap sederhana, ini mencerminkan bahawa model dibangunkan memenuhi kebanyakan kriteria asas tetapi masih berpotensi ditingkatkan dari aspek kejelasan atau keperincian.

Dalam konteks reka bentuk binaan sebenar, kajian mengenai *atribut buildability* semasa fasa reka bentuk juga menggunakan skala Likert (1–5) untuk menilai aspek struktur, reka bentuk, dan kebolehpraktisan binaan dan mendapati nilai purata sekitar 3 (*moderately important* / sederhana penting), menunjukkan persepsi yang serupa terhadap kebolehsesuaian dan praktikaliti reka bentuk bangunan.

4. Kesimpulan

Kajian ini telah berjaya membangunkan dan menilai secara awal satu alat bantu mengajar inovatif yang dinamakan *Modular Assemble Learning Kit (MoAL Kit)* bagi tujuan mempertingkatkan kefahaman pelajar terhadap konsep dan komponen dalam Sistem Binaan Berindustri (IBS). Berdasarkan analisis data yang diperoleh daripada kumpulan responden yang terdiri daripada pelajar sekolah menengah dan kolej vokasional, didapati bahawa majoriti pelajar mempunyai pendedahan yang terhad terhadap model pembinaan modular, dan tahap pengetahuan mereka terhadap sistem IBS adalah rendah.

Walau bagaimanapun, hasil dapatan selepas penggunaan MoAL Kit menunjukkan peningkatan tahap kefahaman pelajar terhadap struktur bangunan, reka bentuk modular, serta kesesuaian model untuk aplikasi pembelajaran. Nilai min keseluruhan bagi ketiga-tiga aspek utama yang dinilai (struktur bangunan, reka bentuk, dan praktikaliti model) adalah pada tahap sederhana (min = 2.9). Ini menunjukkan bahawa kit pembelajaran ini mempunyai potensi yang baik sebagai alat bantu mengajar yang boleh ditambah baik dari semasa ke semasa.

Penggunaan MoAL Kit telah membantu meningkatkan pemahaman pelajar melalui pendekatan visual dan *hands-on* yang lebih interaktif, sekaligus menjawab keperluan terhadap kaedah pengajaran yang lebih praktikal dalam pendidikan TVET. Dapatan kajian ini turut menyokong pandangan bahawa inovasi dalam bahan bantu mengajar amat penting dalam meningkatkan minat dan pemahaman pelajar dalam bidang teknikal.

Sebagai kesimpulan, pembangunan MoAL Kit ini dilihat sebagai satu pendekatan yang relevan dan berkesan dalam menyokong pembelajaran IBS di peringkat sekolah menengah vokasional. Kajian lanjutan disarankan untuk menilai keberkesanan kit ini dalam skala yang lebih besar serta meneroka potensi integrasi teknologi seperti Augmented Reality (AR) atau elemen digital interaktif dalam kit pembelajaran teknikal masa hadapan.

TAHAP KOMPETENSI DAN KEMAHIRAN *SOFTSKILLS* GRADUAN JABATAN PERDAGANGAN POLITEKNIK TUANKU SULTANAH BAHIYAH (PTSB)

Noraihan Mamat Zambi*, Rosnida Othman, Nor Fathimah Fathil

Jabatan Perdagangan, Politeknik Tuanku Sultanah Bahiyah, 09090 Kulim, Kedah

*Alamat e-mel penulis: noraihan@ptsb.edu.my

Abstrak

Pasaran kerja yang kompetitif memerlukan graduan yang kompeten dan sentiasa melengkapkan diri dengan kemahiran *softskills* yang sesuai bagi menjadikan mereka lebih berdaya saing dan selari dengan kehendak pasaran. Objektif kajian ini adalah untuk mengukur tahap kompetensi dan kemahiran *softskills* di kalangan graduan Jabatan Perdagangan PTSB. Pengukuran tahap kompetensi dan kemahiran *softskills* dibuat berdasarkan pernyataan *Programme Educational Objective (PEO)* yang dibangunkan oleh pihak Jabatan Pendidikan Politeknik Dan Kolej Komuniti (JPPKK). PEO ini menggariskan 4 elemen penting iaitu kompetensi dan kemahiran *softskills* seperti kemahiran komunikasi, penyelesaian masalah dan keusahawanan. Instrumen kajian yang digunakan adalah borang soal selidik berbentuk *google form*. Responden bagi soal selidik ini melibatkan seramai 126 orang graduan yang telah menamatkan pengajian antara 3 hingga 5 tahun. Responden mewakili 3 program Jabatan Perdagangan; Diploma Akauntansi (DAT), Diploma Pengajian Perniagaan (DPM) dan Diploma Pemasaran (DPR). Data dianalisis menggunakan SPSS 26.0. Hasil dapatan keseluruhan menunjukkan skor min adalah tinggi dan sangat tinggi bagi semua elemen yang dinilai. Skor min tertinggi bagi semua program ditunjukkan melalui kemahiran komunikasi iaitu 4.32 dan skor min terendah ditunjukkan melalui kompetensi dan kemahiran keusahawanan iaitu 4.05. Walaupun dapatan bagi kesemua elemen yang dinilai adalah tinggi, namun ruang penambahbaikan boleh dilaksanakan oleh pihak institusi bagi meningkatkan tahap kompetensi dan kemahiran keusahawanan graduan melalui pelaksanaan pelbagai aktiviti peningkatan kemahiran dan penambahbaikan kaedah pelaksanaan Pengajaran dan Pembelajaran (PdP) serta kurikulum bagi setiap program.

Kata kunci: Kompetensi; Softskills; Programme Educational Objectives (PEO).

1. Pengenalan

Cabaran hebat dalam dunia pekerjaan masa kini memerlukan pihak institusi dan graduan khususnya sentiasa peka dalam memenuhi kehendak pasaran pekerjaan. Pihak institusi memainkan peranan penting dalam melahirkan graduan yang bersifat holistik yakni lengkap dari segi kompetensi dan kemahiran *softskills* yang sesuai. Ini selari dengan lonjakan yang terkandung dalam Pelan Pembangunan Pendidikan Malaysia 2015-2025 (Pendidikan Tinggi) iaitu melahirkan graduan yang holistik, berciri keusahawanan dan seimbang. Namun begitu, masih terdapat graduan yang hanya mementingkan ilmu dan kemahiran sahaja dan mengabaikan kemahiran *softskills* yang sepatutnya menjadi nilai tambah dalam diri mereka. Dan sebaliknya terdapat juga graduan yang hanya mementingkan kemahiran *softskills* namun tiada pengetahuan dan kemahiran dalam bidang yang diceburi. Jika situasi ini berterusan, graduan yang belum mendapat pekerjaan akan sukar mendapat tempat di pasaran manakala graduan yang telah bekerja mungkin sukar untuk bertahan dalam bidang masing-masing. Menurut Othman & Husin (2019), keperluan industri negara semakin sukar dipenuhi berikutan graduan yang dihasilkan kini kurang berkemahiran dari aspek teknikal dan *softskills* terutama dalam mendepani dunia yang semakin mencabar. Ini disokong oleh Ali et. al (2021) yang menyatakan antara cabaran kepada graduan adalah melengkapkan diri dengan pengetahuan dan kemahiran yang lebih baik agar dapat bekerja dan mengatasi rintangan dalam pasaran

yang semakin mencabar. Graduan perlu bijak mengambil peluang dalam keadaan semasa dengan kebolehan yang ada pada mereka untuk mencipta kelebihan kepada mereka kerana mereka telah dibekalkan dengan kemahiran softskills dan kompetensi yang secukupnya semasa berada di institusi pengajian (Ahmad Mokhtar & Lakman, 2021). Oleh itu, setiap institusi perlu mempunyai alat pengukuran yang sesuai bagi mengukur pencapaian pelajar atau graduan semasa dan selepas mereka menamatkan pengajian. Justeru itu, rekabentuk kurikulum berasaskan *Outcome Based Education (OBE)* yang digunapakai di institusi pendidikan telah memperincikan hasil pembelajaran yang diharapkan yang perlu dicapai oleh pelajar dalam program pendidikan. Salah satu dari komponen pengukuran hasil pembelajaran pelajar adalah melalui *Programme Educational Objectives (PEO)*. Pengukuran hasil pembelajaran bukan sahaja perlu dalam tempoh pengajian sahaja, tetapi ianya juga perlu diukur selepas graduan menamatkan pengajian. PEO merupakan pernyataan umum yang memerihalkan pencapaian kerjaya dan profesional graduan dalam tempoh 5 tahun selepas menamatkan pengajian (Garis Panduan Amalan Baik MQA: Penilaian Pelajar, 2014).

Jabatan Perdagangan Politeknik Tuanku Sultanah Bahiyah (PTSB) menawarkan 3 program pengajian iaitu Diploma Akauntansi (DAT), Diploma Pengajian Perniagaan (DPM) dan Diploma Pemasaran (DPR). Setiap program mempunyai PEO masing-masing yang terdiri daripada 4 elemen penting iaitu kompetensi dan kemahiran *softskills* seperti kemahiran komunikasi, penyelesaian masalah dan keusahawanan. PEO yang dibangunkan oleh Jabatan Pendidikan Politeknik Dan Kolej Komuniti (JPPKK) adalah selari dengan visi dan misi Politeknik. Kajian ini adalah berdasarkan persepsi graduan terhadap pencapaian mereka terhadap PEO selepas mereka meninggalkan institusi. Pengukuran berasaskan PEO ini merupakan petunjuk kepada institusi samada graduan yang dilahirkan kompeten dan mampu menerapkan kemahiran *softskills* dalam diri mereka ataupun tidak. Justeru itu, objektif kajian ini adalah untuk mengukur tahap kompetensi dan kemahiran *softskills* di kalangan graduan Jabatan Perdagangan PTSB. Kajian ini akan mengenalpasti tahap kompetensi dan kemahiran *softskills* mengikut program pengajian. Selain itu juga, kajian ini akan mengenalpasti penguasaan graduan bagi setiap elemen kompetensi dan kemahiran *softskills* yang diukur. Pengukuran PEO ini adalah penting kerana ianya menunjukkan keberhasilan graduan dan sumbangan graduan kepada industri dan masyarakat. Ianya juga dapat memastikan kurikulum dan program yang ditawarkan sentiasa ditambahbaik serta kekal relevan sesuai dengan peredaran masa.

Terdapat banyak kajian lepas yang membincangkan berkaitan kepentingan kompetensi dan kemahiran *softskills*. Keupayaan graduan menyesuaikan diri dengan dunia pekerjaan bergantung kepada tahap kompetensi dan kemahiran *softskills* yang ada dalam diri mereka. Majikan memerlukan pekerja yang mempunyai pelbagai kemahiran *softskills* bagi meningkatkan produktiviti mereka dan kompetensi juga penting bagi memenuhi keperluan pelanggan. Kompetensi adalah ciri dasar seseorang individu yang melibatkan pengetahuan, kemahiran dan kebolehan mereka serta membolehkan mereka menjalankan sesuatu tugasan atau peranan yang diberikan dengan penuh makna dan pengertian (Garis Panduan Amalan Baik MQA : Penilaian Pelajar, 2014).). Hasil pembelajaran bukan sahaja menekankan aspek akademik, malahan juga kemahiran tambahan yang perlu bagi memastikan graduan yang berkualiti dapat dihasilkan. Selain dari kecemerlangan akademik, kaedah pengajaran dan pembelajaran di Institusi Pengajian Tinggi (IPT) turut menekankan penguasaan pelajar terhadap *softskills* bagi memastikan graduan bukan sahaja cemerlang dari segi akademik, tetapi juga dapat menguasai pelbagai kemahiran yang diperlukan oleh industri (Suradi & Rosli, 2020). Kemahiran *softskills* merupakan kemahiran yang boleh dikuasai oleh graduan sebelum memasuki alam pekerjaan. Graduan yang memiliki kemahiran ini mempunyai nilai tambah dan dapat memasarkan diri mereka kepada majikan berbanding graduan lain yang tidak dapat menguasai kemahiran *softskills* (Ramzy Rameshan & Hamzah , 2022).

Antara kemahiran *softskills* yang menjadi keutamaan kepada majikan adalah kemahiran komunikasi. Menurut Suradi & Rosli (2020), kemahiran komunikasi tidak dapat dikuasai oleh

seseorang dalam sekelip mata sahaja tetapi ianya melibatkan aktiviti yang berterusan dalam proses pengajaran dan pembelajaran yang dilaksanakan sepanjang tempoh pengajian di IPT. Ini selaras dengan kajian oleh Bassah & Mohd Noor (2023) yang menyatakan kemahiran kebolehpasaran yang diperlukan untuk graduan *Technical and Vocational Education and Training (TVET)* di Malaysia termasuk kemahiran sosial dan komunikasi. Pakar industri berpendapat bahawa graduan TVET mesti mempunyai kemahiran sosial dan komunikasi yang baik. Kemahiran ini mesti dipelajari secara langsung dan tidak langsung di peringkat kampus. Kemahiran ini penting bagi membolehkan mereka mudah berinteraksi dan bersaing untuk mendapat tempat di hati majikan atau industri. Ini disokong oleh Roslan et.al (2023) yang mengatakan majikan beranggapan seharusnya pekerja mempunyai kemahiran berkomunikasi yang baik dan merasa bertanggungjawab terhadap pekerjaan mereka agar kualiti kerja yang dihasilkan menjadi lebih baik. Menurut Norman et. al (2017), kemahiran komunikasi dan kemahiran interpersonal menunjukkan jurang prestasi yang paling besar yang ditemui di dalam kajian yang dilakukan ke atas graduan semasa yang sedang bekerja. Selain itu, penguasaan kemahiran komunikasi yang lemah akan memberi kesan kepada kurangnya kredibiliti graduan untuk berdaya saing di peringkat global (Awaludin & Ali, 2024). Dapatan ini selaras dengan penyelidikan yang dijalankan oleh Krishnan et al. (2019) yang menyatakan bahawa kemahiran komunikasi yang lemah dalam kalangan graduan TVET akan menjejaskan prestasi mereka dalam berurusan dengan pelanggan.

Menurut Arizan et.al (2023), graduan masa kini perlu lebih mempunyai kemahiran berfikir secara kreatif, menganalisis, berimaginasi, menerokai, mempelopori, mengenalpasti dan menyelesaikan masalah. Majikan tidak berminat untuk mengambil bakal pekerja yang tidak mempunyai kemahiran penyelesaian masalah, walaupun graduan itu mempunyai kelayakan yang cemerlang dan kebolehan luar biasa (Beleina, Rene, 2018). Ini disokong oleh Rahmat et.al (2018) yang menyatakan kemahiran berfikir secara kritis dan penyelesaian masalah merupakan kemahiran yang penting dalam pasaran pekerjaan. Jelaslah bahawa kemahiran menyelesaikan masalah adalah penting kepada graduan dalam menempuhi alam pekerjaan. Dasar Ekonomi Baru (DEB) yang telah dibentuk membuktikan komitmen kerajaan untuk memperbanyakkan usahawan di Malaysia. Pembangunan ke arah melahirkan budaya keusahawanan dilaksanakan di IPT termasuklah Politeknik. Ini disokong oleh objektif yang terkandung dalam Pelan Pembangunan Pendidikan Malaysia 2015-2025 (Pendidikan Tinggi) iaitu untuk melahirkan graduan yang mempunyai minda keusahawanan dan mewujudkan sistem pendidikan yang melahirkan graduan yang berciri keusahawanan dan bukan hanya mencari kerja. Menurut Bakar (2020), graduan mempunyai persepsi positif terhadap kemahiran keusahawanan. Namun, graduan tidak menjadi usahawan kerana kurang peluang dalam bidang keusahawanan. Ini selaras dengan kajian oleh Ngoo et. al (2015), antara kemahiran *softskills* yang dikaji, hanya kemahiran usahawan sahaja yang tidak ketara dalam bidang perakaunan dari persepsi graduan dan majikan. Justeru, dalam usaha untuk menyediakan graduan dengan kemahiran keusahawanan, pihak politeknik telah menyediakan kursus keusahawanan dan pelajar-pelajar dijangka akan memperolehi asas ilmu keusahawanan dan kompetensi yang relevan dalam bidang keusahawanan apabila tamat pengajian (Bakar R, 2020).

2. Metodologi

Kajian ini melibatkan responden dari kalangan graduan tahun 2021 bagi program DAT, DPM dan DPR Jabatan Perdagangan, PTSB. Data dikumpulkan melalui soal selidik yang diedarkan melalui *google form.* Bilangan responden adalah seramai 126 orang. Maklum balas yang diperoleh dianalisis untuk menilai pencapaian dan kemahiran yang diperoleh oleh graduan sepanjang pengajian dan pengalaman kerja selepas tamat belajar. Data telah dianalisis secara deskriptif dengan melibatkan penggunaan frekuensi, peratusan dan min. Item-item dalam soal selidik tersebut adalah berdasarkan kepada penyataan dalam PEO bagi setiap program yang dapat ditunjukkan seperti berikut:

Jadual 2.1. Senarai Objektif Pendidikan Program (PEO) bagi Program DAT

	Keterangan PEO
PEO 1	Graduan berpengetahuan dan mempunyai kompeten dalam bidang perakaunan seiring dengan keperluan industri.
PEO 2	Graduan secara efektifnya dapat berkomunikasi secara sosial, bertanggungjawab dan menunjukkan kualiti kepimpinan yang baik dalam organisasi.
PEO 3	Graduan mahir menyelesaikan masalah dalam perniagaan secara inovatif, kreatif dan beretika melalui pendekatan yang mampan.
PEO 4	Graduan mampu menunjukkan kemahiran keusahawanan dan mengenalpasti keperluan pembelajaran sepanjang hayat untuk perkembangan kerjaya.

Jadual 2.2. Senarai Objektif Pendidikan Program (PEO) bagi Program DPM

	Keterangan PEO
PEO 1	Graduan berpengetahuan dan mempunyai kemahiran teknikal dalam bidang perniagaan seiring dengan keperluan industri.
PEO 2	Graduan secara efektifnya dapat berkomunikasi secara sosial, bertanggungjawab dan menunjukkan kualiti kepimpinan yang baik di dalam organisasi.
PEO 3	Mampu menyelesaikan masalah dalam situasi perniagaan secara inovatif, kreatif dan etika melalui pendekatan yang mampan.
PEO 4	Graduan mampu menunjukkan kemahiran keusahawanan dan mengenalpasti keperluan pembelajaran sepanjang hayat untuk perkembangan kerjaya.

Jadual 2.3. Senarai Objektif Pendidikan Program (PEO) bagi Program DPR

	Keterangan PEO
PEO 1	Graduan yang berpengetahuan dan mempunyai kemahiran teknikal dalam bidang perniagaan seiring dengan keperluan industri.
PEO 2	Graduan yang secara efektifnya dapat berkomunikasi secara sosial, bertanggungjawab dan menunjukkan kualiti kepimpinan yang baik dalam organisasi.
PEO 3	Graduan yang mampu untuk menyelesaikan masalah dalam perniagaan secara inovatif, kreatif dan beretika menerusi pendekatan yang mampan.
PEO 4	Graduan yang mampu menunjukkan kemahiran keusahawanan dan mengenalpasti keperluan pembelajaran sepanjang hayat untuk perkembangan kerjaya.

Kesimpulannya, penyataan PEO bagi ketiga-tiga program ini merumuskan 4 elemen penting yang perlu dikuasai oleh graduan; kompetensi, kemahiran komunikasi, penyelesaian masalah dan keusahawanan. Untuk menilai instrumen yang terdiri daripada 17 item, analisis kebolehpercayaan menggunakan Alpha Cronbach telah dilakukan melibatkan 10 sampel yang sah bagi soal selidik program DAT, DPM dan DPR. Nilai pekali Alpha Cronbach bagi soal selidik program DAT ialah 0.988, bagi program DPM menunjukkan nilai 0.979, manakala bagi program DPR pula menunjukkan nilai 0.975. Hasil ini membolehkan penggunaan instrumen yang meluas untuk pengukuran seterusnya tanpa kebimbangan tentang ketekalan.

3. Dapatan dan Perbincangan

Data-data yang diperolehi daripada borang soal selidik telah dianalisis dengan menggunakan perisian SPSS versi 26.0. Hasil analisis dapatan kajian dapat ditunjukkan secara terperinci seperti berikut. Daripada Jadual 3.1, profil demografi menunjukkan daripada 126 orang responden, 66 orang (52.4%) merupakan graduan daripada program Diploma Akauntansi (DAT), 16 orang (12.7%) adalah pelajar program Diploma Pengajian Perniagaan (DPM) dan 44 orang (34.9%) merupakan pelajar daripada program Diploma Pemasaran (DPR). Seramai 95 orang (75.4%) adalah responden dari kalangan graduan perempuan dan 31 orang (24.6%)

responden adalah graduan lelaki. Dari segi bangsa pula, majoriti responden adalah dari kalangan orang Melayu iaitu seramai 97 orang (77.0%), responden berbangsa India adalah seramai 24 orang (19.0%) dan diikuti seramai 5 orang (4.0%) adalah responden berbangsa Cina.

Jadual 3.1. Profil Demografi Responden

Demografi	Kekerapan	Peratusan
Program:		
Diploma Akauntansi (DAT)	66	52.4 %
Diploma Pengajian Perniagaan (DPM)	16	12.7 %
Diploma Pemasaran (DPR)	44	34.9 %
Jantina:		
Lelaki	31	24.6 %
Perempuan	95	75.4 %
Bangsa:		
Melayu	97	77.0 %
Cina	5	4.0 %
India	24	19.0 %

Jadual 3.2 menunjukkan taburan responden mengikut program, jantina dan bangsa. Daripada jumlah 126 orang responden, seramai 31 orang adalah graduan lelaki iaitu 16 orang (12.7%) pelajar DAT, 2 orang (1.6%) graduan DPM dan 13 orang (10.3%) adalah graduan DPR. Jumlah responden yang paling ramai adalah dari kalangan graduan perempuan iaitu seramai 95 orang. Daripada jumlah itu, 50 orang (39.7%) adalah pelajar DAT, 14 orang (11.1%) adalah pelajar DPM dan pelajar DPR adalah seramai 31 orang (24.6%).

Dalam pada itu, seramai 97 orang adalah pelajar adalah berbangsa Melayu iaitu seramai 54 orang (42.9%) adalah graduan DAT, 14 orang (11.1%) adalah graduan DPM dan 31 orang (24.6%) adalah graduan DPR. Graduan yang berbangsa Cina hanyalah seramai 5 orang iaitu 4 orang (3.2%) adalah graduan DAT dan seorang (0.8%) adalah graduan DPR. Manakala bagi responden yang berbangsa India adalah seramai 24 orang (19.0%). Daripada jumlah itu, 8 orang (6.3%) adalah graduan DAT, 3 orang (2.4%) bagi graduan DPM dan seramai 13 orang (10.3%) adalah graduan DPR.

Jadual 3.2. Taburan Responden Mengikut Program, Jantina Dan Bangsa

	Jantina				Bangsa					
	L	%	P	%	M	%	C	%	I	%
DAT	16	12.7	50	39.7	54	42.9	4	3.2	8	6.3
DPM	2	1.6	14	11.1	13	10.3	0	0.0	3	2.4
DPR	13	10.3	31	24.6	30	23.8	1	0.8	13	10.3
Total	31	24.6	95	75.4	97	77.0	5	4.0	24	19.0

Menggunakan maklumat daripada soal selidik yang diberikan kepada responden kajian, analisis deskriptif diterangkan dalam bahagian ini. Interpretasi skor min Moidunny (2021) digunakan sebagai rujukan klasifikasi untuk tahap yang digunakan. Tahap dibahagikan kepada kategori rendah, sederhana dan tinggi berdasarkan purata skor min ini.

Jadual 3.3. Interpretasi Skor Min

Tahap	Min purata
Sangat rendah	1.00 - 1.80
Rendah	1.81 – 2.60
Sederhana	2.61 - 3.20
Tinggi	3.21 - 4.20
Sangat tinggi	4.21 – 5.00

Berdasarkan Jadual 3.4, skor min kemahiran kompetensi yang tertinggi telah dicapai oleh graduan DPM iaitu 4.25 dengan memperoleh tahap yang sangat tinggi bagi item graduan 'berkebolehan mengaplikasikan ilmu asas secara berkesan dalam perniagaan dan mengikut keperluan industri'. Dunia perniagaan pada masa sekarang banyak memerlukan graduan mengaplikasikan pengetahuan teori ke dalam situasi praktikal dunia kerja sesuai dengan tuntutan industri. Pasaran kerja yang berdaya saing memerlukan kerjasama dan kolaborasi antara industri dan IPT (Ngoo, et al, 2015). Manakala item graduan 'mampu menggunakan *softskills* yang kompeten telah dicapai dengan skor min paling rendah, 3.88 oleh graduan DAT. Perkara ini menuntut graduan untuk menggunakan kemahiran bukan teknikal untuk berinteraksi, berkolaborasi dan mengurus diri secara profesional.

Jadual 3.4. Skor Min Kemahiran Kompetensi bagi Graduan JP

Kemahiran kompetensi	Program (Skor min)		
	DAT	DPM	DPR
Mampu menggunakan pengetahuan asas perakaunan / perniagaan / pemasaran yang kompeten.	3.92	4.19	4.14
Mampu menggunakan 'soft skills' yang kompeten.	3.88	4.13	4.02
Berkebolehan mengaplikasikan ilmu asas perakaunan /pengurusan/pemasaran secara berkesan dalam perniagaan dan mengikut keperluan industri.	3.92	4.25	4.02
Purata min	3.91	4.19	4.06

Jadual 3.5 menunjukkan graduan bagi program DPM telah mencapai tahap sangat tinggi bagi kemahiran komunikasi dengan memperoleh skor min tertinggi sebanyak 4.50. Item yang terlibat adalah graduan 'mampu membuat keputusan yang rasional dan efektif'. Kemahiran berkomunikasi banyak diasah apabila mereka banyak terdedah dengan pelbagai program dan penilaian di bilik kuliah berbentuk pembentangan. Situasi sebegini telah meningkatkan keyakinan diri di samping boleh berkomunikasi di mana ianya akan terus dibawa apabila berada di alam pekerjaan dan perniagaan. Manakala graduan DAT telah mencapai skor min terendah sebanyak 4.11 bagi item graduan 'mampu mengamalkan kepimpinan yang berkesan'. Walaupun ianya adalah pada tahap yang tinggi, namun graduan DAT masih memerlukan program peningkatan khusus untuk latihan kepimpinan agar boleh membuat keputusan yang strategik dan memotivasikan orang lain.

Jadual 3.5. Skor Min Kemahiran Komunikasi bagi Graduan JP

Kemahiran komunikasi	Program (Skor min)		
	DAT	DPM	DPR
Mampu berkomunikasi secara efektif dengan rakan sekerja, komuniti dan ahli profesional.	4.18	4.38	4.32
Mampu untuk melaksanakan tanggungjawab sosial dan nilai-nilai kemanusiaan yang berkesan.	4.23	4.31	4.45
Mampu mengamalkan kepimpinan yang berkesan.	4.11	4.25	4.36
Mampu mengamalkan tanggungjawab kerja berpasukan.	4.30	4.44	4.48
Mampu membuat keputusan yang rasional dan efektif.	4.14	4.50	4.36
Purata min	4.19	4.38	4.39

Jadual 3.6 memaparkan skor min bagi kemahiran menyelesaikan masalah di kalangan graduan JP. Dapatan menunjukkan graduan DPM memperoleh skor min tertinggi iaitu 4.25 dengan tahap yang sangat tinggi bagi item graduan 'mampu melakukan tanggungjawab sosial

secara profesional dan beretika selari dengan keperluan kerja seharian' dan item graduan 'mampu mematuhi kod etika profesional dalam persekitaran pekerjaan'. Manakala, skor min terendah telah dicapai oleh graduan DAT sebanyak 3.95 bagi item graduan 'mampu menentukan maklumat dan kemahiran pemikiran kritikal untuk menyelesaikan masalah dalam skop pekerjaan'. Walaupun skor min ini adalah yang terendah, namun ia mencapai tahap yang tinggi juga. Ini menunjukkan graduan JP mampu menentukan maklumat dan kemahiran dalam menyelesaikan masalah dengan menggunakan nilai dan etika dalam pekerjaan. Graduan juga sangat mampu melaksanakan tanggungjawab sosial dan mematuhi kod etika profesional. Ketika di Politeknik, kemahiran menyelesaikan masalah telah dipraktis oleh graduan ketika mereka berada di dalam dan luar bilik kuliah melalui penilaian berterusan dan program-program yang dikendalikan.

Jadual 3.6. Skor Min Kemahiran Menyelesaikan Masalah Bagi Graduan JP

Kemahiran menyelesaikan masalah	Program (Skor min)		
	DAT	DPM	DPR
Mampu menentukan maklumat dan kemahiran pemikiran kritikal untuk menyelesaikan masalah dalam skop pekerjaan.	3.95	4.19	4.14
Mampu menentukan maklumat dan menggunakan kemahiran menyelesaikan masalah dalam proses membuat keputusan.	4.00	4.19	4.18
Mampu menggunakan nilai, etika dan moral untuk menyelesaikan masalah dalam pekerjaan.	4.17	4.19	4.00
Mampu melakukan tanggungjawab sosial secara profesional dan beretika selari dengan keperluan kerja seharian.	4.18	4.25	4.20
Mampu mematuhi kod etika profesional dalam persekitaran pekerjaan.	4.21	4.25	4.18
Purata min	4.10	4.21	4.14

Analisis skor min kemahiran keusahawanan bagi graduan JP ditunjukkan dalam Jadual 3.7. Daripada ketiga-tiga program, graduan DPR telah mencapai skor min tertinggi dengan tahap yang tinggi bagi item graduan 'mempunyai kemahiran teknologi maklumat ke arah pembelajaran berterusan'. Kurikulum Politeknik telah menjadikan kursus Keusahawanan dan Keusahawanan Digital sebagai kursus wajib bagi pelajar DPM dan DPR. Manakala, skor min terendah sebanyak 3.79 dengan tahap yang tinggi juga adalah melibatkan graduan DAT bagi item graduan 'berminat untuk melibatkan diri dalam keusahawanan untuk pembangunan profesional dan kerjaya'.

Jadual 3.7. Skor Min Kemahiran Keusahawanan Bagi Graduan JP

Kemahiran keusahawanan	Program (Skor min)		
	DAT	DPM	DPR
Mempunyai kemahiran teknologi maklumat ke arah pembelajaran berterusan.	3.82	4.13	4.23
Mampu menggunakan kemahiran pengurusan dan keusahawanan.	3.86	4.13	4.14
Berminat untuk melibatkan diri dalam keusahawanan untuk pembangunan profesional dan kerjaya.	3.79	4.19	4.20
Purata min	3.82	4.15	4.19

Jadual 3.8 menunjukkan purata skor min keseluruhan bagi tahap kempetensi dan kemahiran *softskills* graduan JP. Dapatan mendapati kemahiran komunikasi memperoleh purata skor min

keseluruhan tertinggi iaitu 4.32 dan menunjukkan telah mencapai tahap yang sangat tinggi. Manakala, kompetensi dan kemahiran keusahawanan mencapai purata skor min keseluruhan terendah iaitu 4.05 tetapi masih menunjukkan pencapaian pada tahap yang tinggi. Ini menunjukkan bahawa graduan mempunyai kemahiran komunikasi yang sangat baik yang dapat ditunjukkan kepada rakan sekerja, majikan, komuniti dan ahli profesional. Graduan bagi program DPM dan DPR banyak didedahkan dengan aktiviti penilaian secara berkumpulan yang berfokuskan kepada pembentangan seperti *Business Project, Marketing Plan* dan *Marketing Project.* Pelajar perlu melibatkan diri dengan industri luar bagi memastikan produk yang dihasilkan sentiasa menepati kehendak semasa. Ini bertepatan dengan pendapat yang diberikan oleh Ngoo et.al (2015) yang menyatakan, pasaran kerja yang berdaya saing memerlukan kerjasama dan kolaborasi antara industri dan IPT. Sesi soal jawab semasa sesi pembentangan projek dapat membantu meningkatkan keyakinan diri dalam diri pelajar di samping membantu mereka membuat keputusan dengan bijak. Graduan bagi program DAT pula, banyak dilibatkan dengan aktiviti penilaian yang berbentuk *problem base* dan *case study*. Aktiviti ini juga memerlukan mereka bekerja dalam kumpulan dan ianya dapat meningkatkan kemahiran komunikasi dan kemahiran berfikir secara kritis. Graduan juga dapat mengamalkan kerja secara berpasukan, bertanggungjawab sosial, mempunyai sifat kepemimpinan yang baik dan boleh membuat keputusan yang efektif apabila mereka mempunyai kemahiran komunikasi yang sangat baik. Selain itu penawaran kursus *Communicative English* bagi semua program turut membantu menyumbang kepada peningkatan dalam kemahiran komunikasi graduan. Para pensyarah perlu bertindak untuk mengintegrasikan elemen-elemen kemahiran kebolehpasaran yang perlu dikuasai oleh graduan semasa sesi PdP dijalankan (Mohd Azri et.al, 2019).

Jadual 3.8. Purata Skor Min Setiap Kemahiran Graduan JP

Kemahiran	Program (Purata skor min)			Keseluruhan	
	DAT	DPM	DPR	Purata	Tahap
Kompetensi	3.91	4.19	4.06	4.05	Tinggi
Komunikasi	4.19	4.38	4.39	4.32	Sangat tinggi
Penyelesaian masalah	4.10	4.21	4.14	4.15	Tinggi
Keusahawanan	3.82	4.15	4.19	4.05	Tinggi

Selain itu, graduan JP juga mempunyai kemahiran menyelesaikan masalah, kompetensi dan keusahawanan yang baik. Melalui kompetensi, kesemua graduan dapat menggunakan pengetahuan asas dan mengaplikasikan ilmu mengikut bidang masing-masing dalam kerjaya yang diceburi. Graduan juga menunjukkan minat dalam keusahawanan serta boleh menggunakan kemahiran pengurusan dan teknologi maklumat ke arah pembelajaran berkesan. Penglibatan graduan semasa di Politeknik dalam program-program keusahawanan dapat membantu mereka untuk menerapkan ciri-ciri keusahawanan dalam diri di samping menarik minat mereka untuk menceburi bidang keusahawanan. Oleh itu, hasil pencapaian PEO juga dapat menjadi indikator bagi membuktikan graduan memenuhi jangkaan industri (Kasiran et.al, 2022).

4. Kesimpulan

Kompetensi dan kemahiran *softskills* merupakan elemen penting yang dapat meningkatkan kebolehpasaran graduan. Memiliki pekerja yang mempunyai kedua-dua elemen ini merupakan satu bonus kepada majikan. Dapatan kajian menunjukkan kemahiran komunikasi merupakan kemahiran yang tertinggi yang dicapai oleh semua graduan program di JP PTSB. Manakala pencapaian yang terendah bagi program DAT dan DPM adalah kemahiran keusahawanan dan bagi program DPR adalah kompetensi. Secara keseluruhannya, persepsi graduan terhadap pencapaian tahap kompetensi dan kemahiran *softskills* seperti kemahiran

komunikasi, penyelesaian masalah dan keusahawanan adalah berada pada tahap yang tinggi. Namun begitu, penambahbaikan boleh dilakukan terhadap pencapaian tahap kompetensi dan kemahiran keusahawanan yang merupakan pencapaian yang terendah bagi graduan. Dapatan kajian ini boleh memberi input kepada pihak Politeknik bagi membolehkan penambahbaikan dibuat terhadap beberapa aspek yang berkait dengan keberhasilan graduan. Penambahbaikan kurikulum boleh dilakukan melalui menambahbaik penyataan PEO dengan memasukkan elemen-elemen kemahiran *softskills* yang lebih terkini dengan pasaran kerja semasa. Justeru itu, tenaga pengajar perlu menggunapakai kaedah PdP alaf 21 bagi menyesuaikan dengan keperluan pasaran kerja yang lebih bersifat digital. Graduan juga perlu sentiasa mengikuti program peningkatan kemahiran bagi memastikan mereka kekal relevan dan bertahan di pasaran. Penyertaan mereka dalam program ini dapat memberi peluang mereka mendapat kemahiran tambahan yang diiktiraf oleh industri. Kajian ini hanya dijalankan di Jabatan Perdagangan sahaja maka dapatan kajian tidak memberikan gambaran sebenar tentang keseluruhan Politeknik. Dicadangkan pada masa hadapan, bilangan responden kajian dapat ditingkatkan dan diperluaskan kepada graduan dari program kejuruteraan. Kajian lanjut juga boleh dijalankan untuk melihat persepsi majikan terhadap pencapaian PEO graduan.

Abstract

The ability to write scientific articles is an essential skill for university students as future academics and professionals. However, low academic literacy and lack of writing experience often hinder students from producing publishable scholarly works. This community service program aimed to enhance students' scientific writing skills through a structured and practical training model. The training was conducted in several stages, including delivery of fundamental materials, writing practice, and intensive mentoring. The methods used were interactive lectures, group discussions, case studies, and hands-on writing practice based on students' research findings. The participants came from various study programs and showed improved understanding of article structure, academic language usage, and proper citation and referencing techniques. Evaluation results indicated that most participants were able to produce draft articles that met the basic standards for publication. This activity made a positive contribution to promoting a writing culture and encouraging students to actively publish their academic works. such training should be conducted regularly, adapted to the participants' needs and readiness to face the increasingly competitive academic landscape.
Keywords: Scientific writing; Publication skills; Academic training; University students.

1. Introduction

In the era of globalization, characterized by the rapid advancement of science and technology, higher education is expected not only to produce graduates who are theoretically competent but also capable of actualizing their knowledge through systematic and argumentative academic writing. In this context, scientific writing skills have become an essential competence that every student must possess. Scientific writing is not merely a medium of academic communication; it also reflects an individual's ability to think critically, logically, and systematically (Arifin, 2017). Through the process of academic writing, students are guided to develop ideas based on valid theories and data, and are trained to construct structured arguments that are academically accountable. This ability is crucial not only for the development of scientific knowledge but also as a foundation for contributing to the resolution of social issues through evidence-based approaches (Sugiyono, 2019). Furthermore, scientific writing skills are highly relevant in professional fields, particularly in education, research, and public policy-making. Academic outputs such as research reports, journal articles, theses, and dissertations are manifestations of refined scientific literacy developed through methodological and conceptual rigor (BSNP, 2010).

However, various studies show that students often lack a deep understanding of scientific writing. Common challenges include difficulties in selecting relevant topics, weak understanding of writing structures, and the inability to formulate logical, data-based arguments (Sari & Nurhadi, 2021). In some cases, students are unable to distinguish between subjective opinions and academically referenced arguments, which ultimately affects the quality of the scientific papers they produce. Fitriani (2020) emphasizes that limited academic

literacy and a lack of technical writing training are major factors behind students' poor scientific writing skills. This situation is exacerbated by curricula that do not yet place sufficient emphasis on the continuous development of writing competence. As stated by Nugraheni and Nisa (2022), scientific writing skills are not only technical but also conceptual and reflective, and must be nurtured early in higher education as part of core graduate competencies. This issue is also apparent at the Akademi Keuangan Perbankan Nusantara, where many students still struggle to grasp the fundamental concepts of scientific writing, organize their work systematically, and express ideas in an academic manner.

Based on these issues, it is evident that the existing scientific writing training approaches are not yet comprehensive or contextual enough, particularly in vocational higher education institutions like Akademi Keuangan Perbankan Nusantara. Although several training models have been developed, most still focus only on technical aspects such as writing structure or referencing, without integrating deeper conceptual elements and strengthening students' critical and analytical thinking skills. In addition, there is still a lack of studies that specifically evaluate the effectiveness of scientific writing training in improving students' publication capabilities in vocational institutions, indicating a significant research gap. Therefore, a more holistic training model is needed that addresses the real needs of vocational students so that their scientific writing skills improve not only procedurally, but also substantially and competitively (Zamzami, 2023); Nugraheni & Nisa, 2022). To respond to this situation, the author has initiated a program entitled "Scientific Article Writing Training as an Effort to Improve Students' Publication Skills at Akademi Keuangan Perbankan Nusantara." This program is designed as a response to the low scientific writing proficiency among students. The training, which is structured systematically and comprehensively, aims to equip students with critical, analytical, and logical thinking skills—essential foundations for constructing arguments and presenting data in a structured and academically accountable manner. These abilities are fundamental for producing scientific papers that not only meet academic standards but also contribute meaningfully to knowledge development and the enhancement of student publication quality in higher education (Fitriani, 2020; Nugraheni & Nisa, 2022). As such, this training is expected to offer a practical solution that enhances students' scientific writing competence while also fostering a sustainable culture of academic literacy within the Akademi Keuangan Perbankan Nusantara.

2. Methodology

This study employed a quantitative descriptive approach using a pre-experimental design in the form of a one-group pretest-posttest design. This approach was selected to measure the effectiveness of scientific article writing training in improving students' publication skills by comparing the results before and after the training. The subjects were final-year students at the Akademi Keuangan Perbankan Nusantara who had completed the Research Methodology course. A total of 25 students were purposively selected based on their active involvement in academic activities and their interest in scientific publication. The research process began with administering a pretest to assess the students' initial abilities in writing scientific articles. This was followed by a three-day training program focused on scientific article writing, which covered the structure of scientific writing, logical idea development, proper referencing, and journal publication techniques. After the training, students were assigned to write a scientific article as their final task, and a posttest was administered to evaluate the improvement in their skills. The activity schedule is presented in the following table.

The instruments used in this study included: A scientific writing test (pretest and posttest) that had been validated by experts; A scientific article assessment rubric measuring aspects such as structure, language use, originality, and argumentation; A training evaluation questionnaire to gather students' feedback on the effectiveness and quality of the training. The training materials covered the following topics: (1) Introduction to scientific writing and the importance of academic publication, (2) Structure of scientific articles, (3) Techniques for writing the

introduction, method, results, and discussion sections (IMRAD), (4) Citation management and referencing using tools such as Mendeley, (5) Hands-on practice in writing articles based on each student's chosen topic. The data were analyzed using the paired sample t-test with the help of SPSS software to determine whether there was a significant difference between the pretest and posttest scores. In addition, qualitative data from the questionnaires were analyzed descriptively to examine students' responses and perceptions regarding the training process. The flow of activities is illustrated in the following implementation diagram.

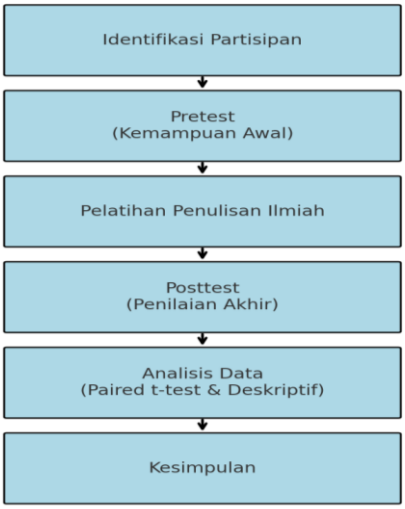

Fig. 1. The flow of activities is illustrated

3. Results and Discussion

This study involved 25 final-semester students from the Akademi Keuangan Perbankan Nusantara as participants. They were purposively selected based on their active involvement in academic activities and their lack of prior experience in scientific publication. Before the training began, the participants took a pretest to assess their initial scientific writing skills. The results indicated the following: Average pretest score: 62.45 out of a maximum score of 100, Skill category: low to moderate, Main weaknesses: article structure, citation errors, and weak logical argumentation. These findings confirm that the majority of students did not yet have a strong foundation in academic scientific writing (Wahyuni, 2021). Following the pretest, all participants participated in a three-day intensive training program that included both theoretical and practical sessions. The training content covered basic concepts of scientific writing, topic selection, article outlining, the use of APA referencing style, and techniques for writing abstracts and conclusions. The training was designed to be interactive, incorporating article assessment simulations and direct feedback from academic facilitators.

Table 1. Implementation of the Training Activities

Day & Date	Training Theme	Activity Details
Day 1 / 14 April 2025	Fundamentals of Scientific Writing	- Introduction to scientific writing and its purposes - General structure of a scientific article - Academic ethics and plagiarism
Day 2/ 15 April 2025	Idea Structuring and Reference Usage	- Techniques for formulating ideas and research focus - Writing argumentative paragraphs - Using references with APA Style
Day 3/ 16 April 2025	Publication Techniques and Writing Simulation	- Strategies for selecting appropriate journals - Article submission and peer-review process - Writing practice and article review by participants

After completing all training sessions, participants took a posttest using the same instrument as in the pretest. The posttest results showed a significant improvement.

Fig. 2. The Training of Scientific Writing

Three-Day Training Narrative General Theme: Fundamentals of Scientific Writing Over the course of three days, participants received comprehensive guidance on scientific writing. The training was divided into three core sessions, each aligned with a specific daily theme, as outlined in Table 1. Day One: Introduction to Scientific Writing. This session introduced the fundamental concepts of academic writing, including its purposes, the general structure of a scientific article, academic ethics, and strategies for avoiding plagiarism. It aimed to establish a solid foundation for high-quality and ethical writing practices. Day Two: Idea Structuring and Reference Usage The second session focused on techniques for formulating ideas and research focus, composing argumentative paragraphs, and applying APA Style in referencing. The objective was to develop the participants' ability to organize ideas logically and cite sources appropriately. Day Three: Publication Techniques and Writing Simulation. Participants were guided through strategies for selecting appropriate academic journals, the manuscript submission process, and the peer review system. The session included practical writing exercises and concluded with peer-review activities to provide constructive feedback and improve manuscript quality. The results of the Paired Sample t-Test between the pretest and posttest scores are as follows:

Table 2. Pretest dan Postest.

Types of Tests	N	Maen	Standar Deviasi	t	Sig. (2-tailed)
Pretest	25	62,45	7,12		
Posttest	25	82,30	6,88	11,452	0,000

The significance level was set at α = 0.05. Source: Ningsih & Harahap (2020). After completing the training, participants took a posttest using the same instrument as the pretest. The posttest results revealed a significant improvement in writing quality. The average score increased to 82.30, with the most notable enhancements observed in article structure (30%), use of academic language (25%), and the ability to formulate logical, data-driven arguments (28%).

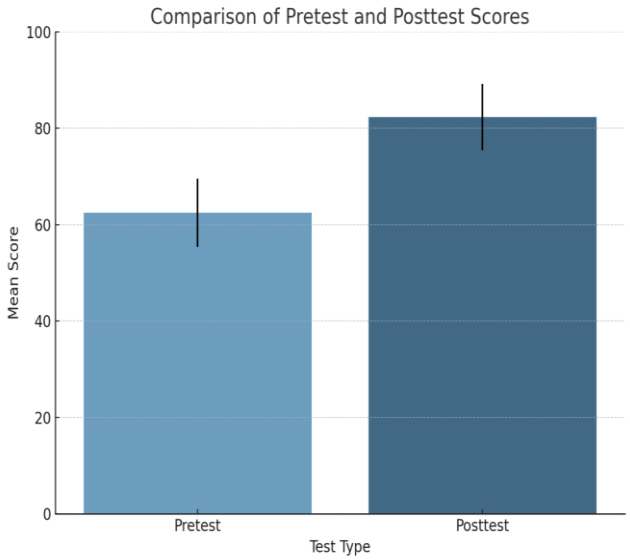

Fig. 3. Comparison of Pretest and Posttest

The analysis graph illustrates a notable increase in students' average scores, rising from 62.45 on the pretest to 82.30 on the posttest. This visual representation clearly reflects the effectiveness of the training in enhancing students' understanding of scientific article writing. The standard deviations, which remained relatively stable at 7.12 for the pretest and 6.88 for the posttest, further support the consistency of the participants' performance. The three-day training program was attended by 25 university students, aimed at improving their academic writing proficiency in a structured and scholarly manner. To assess the impact of the intervention, a paired sample *t*-test was conducted comparing the pretest and posttest scores. The statistical results revealed a *t*-value of 11.452 with a significance level (*Sig. 2-tailed*) of 0.000 ($p < 0.05$), indicating a statistically significant difference between pretest and posttest outcomes. This finding confirms that the training had a meaningful positive effect on students' academic writing skills, particularly in composing scientific articles in line with formal academic standards. These results align with Ningsih and Harahap (2020), who assert that structured and targeted training programs can effectively enhance students' scientific publication competencies. The applied approach of this training bridged the gap between students' initial capabilities and the demands of academic publishing. In addition to quantitative evidence, non-participant observation during the training noted a significant rise in student motivation and engagement in the learning process. Peer-review sessions and interactive discussions provided opportunities for critical reflection and a deeper conceptual grasp of the structure, purpose, and ethical considerations of academic writing (Putra, 2023). Such interventions not only improve technical skills but also foster a scholarly mindset among students throughout the writing process.

The three-day scientific article writing training demonstrated a significant improvement in students' academic writing abilities. Prior to the training, the average pretest score of the participants (N = 25) was 62.45, indicating a limited understanding of scientific writing structure, citation practices, and the formulation of logical arguments. Following the intensive sessions—which covered the IMRAD structure, argument development, APA referencing, and publication simulations—the posttest score rose to 82.30. Statistical analysis using a paired sample t-test yielded a t-value of 11.452 with a significance level of $p = 0.000$ ($p < 0.05$), confirming that the training had a statistically significant effect on enhancing students' scientific writing skills. These findings align with existing literature on the effectiveness of scientific writing training in improving academic literacy and self-efficacy in scholarly communication (Wahyuni, 2021; Dimyati et al., 2019; Ningsih & Harahap, 2020; Wefes et al., 2018).
Qualitative observations revealed that students' active participation in interactive discussions, peer-review sessions, and collaborative writing tasks contributed to increased motivation and

a deeper understanding of academic concepts. This outcome is consistent with the principles of experiential learning (Putra, 2023) and collaborative writing, both of which have been shown to effectively support the development of scientific writing skills (Hartati & Rasyid, 2017). Although a small number of participants encountered challenges in using citation management tools and formal academic language, these patterns highlight the need for continuous guidance and repeated training opportunities beyond a single intensive intervention. The validity of a sustained approach is supported by research on long-term training strategies and iterative learning interventions (Gabber & Ali, 2022); Ibda & Wahyuningsih, 2017); Wefes et al., 2018).

Therefore, structured, contextual, and recurring interventions in scientific literacy training have proven effective in improving students' publication competencies within vocational education settings. Future recommendations include the development of ongoing academic literacy programs, the integration of adaptive technologies (Cheng et al., 2023), and follow-up assessments to monitor medium- and long-term progress (Murugesan, 2012). To holistically prepare students in completing their academic tasks and to make a significant contribution to the world of research and the development of scientific knowledge (aufa, Maknuni, 2024) Based on Results and Discussion above, this study provides students with a deeper understanding of the importance of scientific writing in academic settings. It highlights that the ability to produce structured, evidence-based, and logically argued scientific articles is not only essential for academic success but also contributes to the development of critical thinking, scholarly communication, and professional competence in higher education.

4. Conclusion

The three-day scientific article writing training proved effective in enhancing the academic writing skills of students at the Akademi Keuangan Perbankan Nusantara. This was evidenced by a significant increase in the average score from 62.45 on the pretest to 82.30 on the posttest, as confirmed by the results of the paired sample t-test ($t = 11.452$; $p < 0.05$). The training, which covered understanding the structure of scientific articles, organizing ideas logically, applying APA referencing style, and simulating the publication process, made a substantial contribution to students' mastery of scientific writing skills. These findings emphasize that training based on a systematic, contextual, and practice-oriented (experiential learning) approach not only improves the technical aspects of writing but also fosters students' critical and analytical thinking. Therefore, similar programs should be institutionalized as ongoing initiatives within higher education, especially in vocational settings, to strengthen academic culture and increase students' productivity in scientific publication.

THE INFLUENCE OF PROMOTION AND PRICE ON PURCHASING DECISIONS IN E-COMMERCE SHOPEE THROUGH BRAND IMAGE AS AN INTERVENING VARIABLE

Dimas Anjas Moro*, Ngajudin Nughroho

International Marketing Management Study Program, Polytechnic Cendana, 20153 Medan, North Sumatra, Indonesia

*Corresponding author e-mail: dimasanjasmoro842@gmail.com

Abstract

This study aims to determine the effect of promotion and price on purchasing decisions through brand image on the e-commerce platform Shopee. The subject of this study consisted of students from Cendana Polytechnic in Medan. The sample in this study consisted of 97 respondents, selected using purposive sampling. Data collection techniques included questionnaires, documentation, and observation, using a quantitative research method. The results of this study indicate that brand image influences purchasing decisions on Shopee. Price affects the brand image of Shopee's e-commerce platform but does not influence purchasing decisions directly. However, promotion influences purchasing decisions. Price also affects purchasing decisions indirectly through brand image as an intervening variable.
Keywords: Promotion; Price; Purchasing decision; Brand image; Shopee.

1. Introduction

The rapid development of information technology has brought significant changes in various aspects of life, including in the world of commerce. E-commerce or e-commerce has become one of the top choices for consumers to shop due to its ease of access, wide selection of products, and flexibility of time. In Indonesia, Shopee has emerged as one of the most popular e-commerce platforms, widely used by consumers from diverse backgrounds.

Shopee is an online shopping platform that can only be accessed using the internet. The app was launched in 2015. According to CNN Indonesia (2023), Data.ai noted that Shopee is the most in-demand online shopping platform in Indonesia, with the highest total downloads on both the Google Play Store and App Store. The total number of Shopee users and visitors continues to increase every month. Currently, Shopee remains the number one e-commerce platform in Indonesia. According to Similarweb data, Shopee currently leads the Indonesian e-commerce marketplace in terms of visitors. In September 2023, the Shopee website recorded approximately 237 million visits, representing a 38% increase compared to the start of the year (*year-to-date*/ytd).

In the increasingly fierce competition in the e-commerce industry, businesspeople must be able to attract the attention of consumers and maintain their loyalty. Some of the factors that influence consumer purchase decisions on e-commerce platforms include promotions, prices, and brand image. These three factors play an important role in shaping consumer perception and influencing their decision to purchase a product or service.

Promotion is one of the effective marketing tools to attract consumers' attention. In the company's modern marketing activities, it is related to the planning and development of good products and determining attractive prices for customers. Promotion is a one-way flow of information or persuasion created to direct a person or organization to actions that create exchange in marketing, according to Kotler and Keller (2016), promotion is a way for companies to inform, persuade, and remind consumers about the products and brands they

sell. Through promotions, companies can provide information about products, offer discounts, cashback, and various other incentives that can encourage consumers to make purchases. Attractive, targeted promotions can increase consumer buying interest and speed up purchasing decisions. The factor that can affect customer decisions in determining purchase decisions for customers is price. Price has a very important role in influencing customer decisions in determining purchases on Shopee E-Commerce so that it greatly determines the success of the promotion.

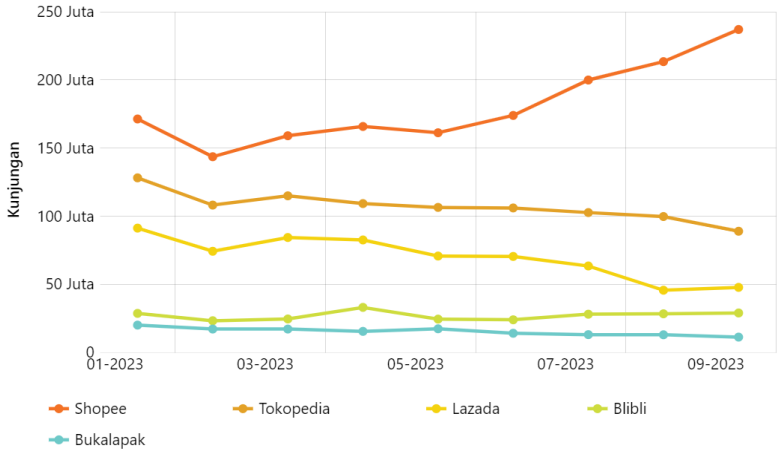

Fig.1. Similarweb data

2. Methodology

In this study, the population consists of two types, namely the general population and the target population. The general population in this study refers to all Shopee consumers, the exact number of whom is unknown. The target population, from which the research sample is drawn, consists of Cendan Polytechnic students who have made at least two purchases. Because the number of the target population is unknown, the Margin of error formula, according to Sugiyono (2017) is used as follows:

$$n = \frac{Z^2}{4\,(Moe)^2} \tag{1}$$

Information:
n = Number of Samples
Z = Sample discovery required confidence level 95%
(Z = 1.96)
Moe = *Margin of error,* i.e. maximum allowable error, and
Determined 10%
Account:

$$n = \frac{Z^2}{4\,(Moe)^2} \tag{2}$$

$$n = \frac{1{,}96^2}{4\,(10\%)^2}$$

$$n = \frac{3{,}8416}{0{,}04} = 96{,}04$$

According to the calculation results, the number of samples in this study was rounded to 97 respondents, as the variable is discrete and rounding is necessary.

Table 1. Description of the characteristics of the research subject by gender

Yes	Gender	Sum	Percentage
1.	Men	64	67%
2.	Woman	32	33%
	Total	97	100%

Based on the results in Table 1, male students dominate the respondents, with 67% of participants being male and 33% female. This may be because the majority of students at Medan Cendana Polytechnic are male. However, the gender composition could also reflect the response tendency of male students to participate in this research.

Table 2. Validity Test Results

Variable	Indicator	Outer Loading	(Average Variance Extracted)	Information
Promotion	PROMOTION 1	0.699	0.526	Valid
	PROMOTION 2	0.771		Valid
	PROMOTION 3	0.723		Valid
	PROMOTION 4	0.644		Valid
	PROMOTION 5	0.811		Valid
	PROMOTION 6	0.700		Valid
	PROMOTION 7	0.757		Valid
	PROMOTION 8	0.782		Valid
	PROMOTION 9	0.759		Valid
	PROMOTION 10	0.746		Valid
Price	PRICE 1	0.762	0.502	Valid
	PRICE 2	0.615		Valid
	PRICE 3	0.729		Valid
	PRICE 4	0.679		Valid
	PRICE 5	0.679		Valid
	PRICE 6	0.625		Valid
	PRICE 7	0.657		Valid
Brand Image	IMAGE 1	0.681	0.518	Valid
	IMAGE 2	0.740		Valid
	IMAGE 3	0.751		Valid
	IMAGE 4	0.641		Valid
	IMAGE 5	0.751		Valid
	IMAGE 6	0.779		Valid
Purchase Decision	KP 1	0.732	0.549	Valid
	KP 2	0.658		Valid
	KP 3	0.784		Valid
	KP 4	0.712		Valid
	KP 5	0.749		Valid
	KP 6	0.676		Valid
	KP 7	0.676		Valid
	KP 8	0.754		Valid
	KP 9	0.732		Valid
	KP 10	0.722		Valid

Table 2 shows that all indicators are eligible. In addition to examining the value of outer loading, the researcher also needs to consider the value of AVE *(Average Variance Extracted).* Based on Table 42, it is known that all indicators already have an AVE value greater than 0.50. This indicates that all indicators have met the validity test standards.

Table 3. Reliability Test Results

Variable	Composite Reliability	Cronbach's Alpha	Information
Brand Image	0.819	0.828	Reliable
Price	0.808	0.811	Reliable
Purchase Decision	0.883	0.886	Reliable
Promotion	0.909	0.921	Reliable

Based on Table 3, it is evident that the composite reliability value for the respondents exceeds 0.70, indicating that the data can be considered reliable. In the instrument test, reliability is

evident from the Cronbach's Alpha value, which shows that all indicators have a value of more than 0.50. Therefore, the data is considered reliable.

Table 4. Results Goodness of fit model

	Saturated model	Estimated model
Standardized Root Mean	0.100	0.102
Square Euclidean Distance	5.329	5.507
Geodesic Distance	1.945	1.938
Chi-square	902.762	905.879
Normed Fit Index	0.587	0.586

Based on Table 4, the Normed Fit Index criteria are greater than 0.5, indicating a good model. The Normed Fit Index criterion of 0.634 > 0.5 indicates a good fit.

Table 5. Determination Coefficient Results

	R Square	*R Square Adjusted*
Brand Image	0.348	0.341
Purchase Decision	0.650	0.639

The Adjusted R Square value of 0.341 for the dependent variables of purchase decisions can be explained by the variables of promotion, brand image, and price of 63.9% while 36.1% is explained by other variables that were not examined in the study. Regarding the R-squared adjusted value, the intervening variable, namely brand image, can be explained by the promotion variable, with price accounting for 34.1%, while 65.9% is explained by other variables not examined in this study.

Table 6. Direct Impact Test Results

	Original Sample (O)	Sample Mean (M)	Standard Deviation (STDEV)	T Statistics (|O/STDEV|)	P Values
Brand Image -> Purchase Decision	0.677	0.679	0.078	8.657	0.000
Price -> Brand Image	0.590	0.606	0.070	8.425	0.000
Price -> Purchase Decision	-0.123	-0.121	0.135	0.913	0.362
Promotion -> Purchase Decision	0.372	0.371	0.112	3.314	0.001

Based on Table 6, it shows that the majority have *a p-value* of <0.05, meaning that they have a significant influence of exogenous variables on endogenous variables. In the data above, it can also be seen that there is a non-significant influence, namely on the ease of access to buying interest and the ease of access to purchase decisions that have *a p-value* of >0.05, meaning that it is not significant or the hypothesis is not supported. As for the other variables, they have *green p-values*, which means that the hypothesis is accepted.

Table 7. Indirect effect test results

	Original Sample (O)	Sample Mean (M)	Standard Deviation (STDEV)	T Statistics (|O/STDEV|)	P Values
Price -> Brand Image -> Purchase Decision	0.399	0.413	0.076	5.236	0.000

Table 7 shows that the *p-values* show that the majority have *a p-value* of <0.05, meaning that there is a significant influence between exogenous variables and endogenous variables. However, there is an insignificant variable, namely ease of access to purchase decisions through buying interest, which serves as an intervening variable with a p-value of > 0.05, indicating that it is not significant and the hypothesis is not supported.

Table 8. Result of the research hypothesis

Hypothesis	Influence	T-Statistics	p-values	Information
H1	Brand Image -> Purchase Decision	8.657	0.000	Hypothesis Accepted
H2	Price -> Brand Image	8.425	0.000	Hypothesis Accepted
H3	Price -> Purchase Decision	0.913	0.362	Hypothesis Rejected
H4	Promotion -> Purchase Decision	3.314	0.001	Hypothesis Accepted
H5	Price -> Brand Image -> Purchase Decision	5.236	0.000	Hypothesis Accepted

Table 8 shows that several hypothetical results are not accepted. This hypothesis includes the second hypothesis, namely that ease of access has no effect on purchase decisions. The fifth hypothesis is that ease of access has no effect on buying interest, and the eighth hypothesis is that ease of access has no effect on purchasing decisions through buying interest as an *intervening variable.* The results of the other hypothesis were declared accepted because they met the requirements with *p-values < 0.05.*

4. Conclusion

Based on the discussion, analysis and testing, the conclusions drawn are as follows: The results of this study state that brand image variables affect purchase decisions on Shopee, price variables affect the brand image of Shopee, price variables have no effect on purchase decisions on Shopee e-commerce, promotion has an effect on purchasing decisions, the price variable affects the purchase decision through brand image as an intervening variable.

Abstract

Sports play a crucial role in promoting a healthy and balanced lifestyle, particularly among university students navigating academic challenges. This study explores the participation levels and attitudes toward sports among Foundation Studies students at Universiti Utara Malaysia. Using an exploratory approach, primary data were collected via a structured Google Forms survey involving 171 respondents. The study examined students' demographic profiles, past and current participation in sports, types of sports engaged in, and the reasons influencing both participation and non-participation. Findings revealed that while the majority had prior involvement in sports during school years, current participation dropped significantly, with only 26% actively engaging in any sport. Badminton emerged as the most popular sport, while lack of time, motivation, and perceived priority were cited as key barriers. Despite recognizing the physical and mental health benefits of sports, students demonstrated a gap between awareness and action. The results underscore the need for institutional initiatives to promote sports participation as part of students' daily routines. This study provides valuable insights for university administrators and educators to develop strategies that integrate sports into the broader agenda of student well-being, productivity, and holistic development, aligning with the goals of Technical and Vocational Education and Training (TVET) and higher education institutions.

Keywords: Sports participation; Student attitude; Foundation studies.

1. Introduction

Sports play a crucial role in promoting health, productivity, and overall well-being across all stages of life (Jariono & Subekti, 2020; Wibowo, 2019). Individuals can engage in various types of sports activities depending on their interests, skills, and motivation. The importance of physical activity becomes even more apparent when considering the health challenges faced by populations today. According to the World Health Organization (WHO), coronary heart disease remains one of the leading causes of death in Malaysia, accounting for approximately 29,363 fatalities annually (WHO, 2019; Khaw & Yong, 2024). This condition is primarily caused by plaque build-up along the arterial walls, which restricts blood flow to the heart (Thakur *et al.*, 2018). Unhealthy dietary habits, particularly the consumption of foods high in cholesterol and saturated fats, contribute significantly to this problem (Al-Jawaldeh & Abbass, 2022; Gomez *et al.*, 2021). Other major health issues in Malaysia include stroke, influenza and pneumonia, chronic lung diseases, and diabetes, all of which rank among the country's top medical concerns (WHO, 2019). In addition, the prevalence of obesity and overweight individuals in Malaysia has been steadily rising. A 2020 study by the Ministry of Health (MOH) revealed that more than half of the adult population is affected by these

conditions (Yong *et al*., 2020). These trends highlight the pressing need for preventive measures, among which regular engagement in sports and physical activity is a critical component.

Among the key factors contributing to these health concerns is the general lack of involvement in physical activities. A sedentary lifestyle significantly increases the risk of developing chronic diseases, while active participation in sports contributes to improved physical and mental health. Sports engagement occurs across all segments of society, including youth, working adults, and students in higher education. University and college students, as a vital subset of the population, engage in sports for various reasons—ranging from personal interest and skill development to utilizing available campus facilities. Additionally, sports serve as a recreational outlet that allows students to spend their leisure time in a meaningful way, promoting enjoyment, stress relief, and social interaction. Given this context, the present study seeks to examine the patterns of sports participation and attitudes among Foundation Studies students. The findings aim to inform institutional strategies to enhance student engagement in physical activities, thereby contributing to healthier lifestyle habits within the university community.

2. Methodology

This study employed an exploratory research design to investigate the levels of participation and attitudes toward sports among students in Foundation Studies. The objective was to gain insights into students' personal opinions, behavioral motivations, and the social or institutional factors influencing their engagement with sports, as perceived both individually and through peer interactions. Primary data were collected through a self-administered online survey distributed via Google Forms to students enrolled in the Foundation Studies programme. The data are classified as primary because they were collected firsthand by the researchers using a systematic approach targeted specifically at the study's population of interest. All respondents were Foundation Studies students at Universiti Utara Malaysia. Before distribution, the survey instrument underwent pilot testing to ensure the clarity, reliability, and relevance of the items. Feedback from the pilot phase was used to refine the questionnaire, enhancing its validity and improving respondent comprehension. Once finalized, the questionnaire was disseminated online, allowing for efficient and broad data collection.

The data collection process followed several key stages: (1) development of the questionnaire, (2) pilot testing and refinement, (3) official distribution of the survey, (4) response monitoring, and (5) data cleaning and preparation for analysis. These steps were crucial in ensuring the overall quality and integrity of the data. The questionnaire included a combination of question types. Students were asked to provide basic demographic information, including their full name, matriculation number, and gender. The survey also featured binary questions (e.g., 'yes' or 'no'), with the addition of a 'sometimes' option to capture more nuanced responses and reduce bias. This design was intended to offer respondents the flexibility to select the most accurate options that reflected their personal experiences. In addition, Likert-scale items were included to assess students' attitudes toward sports participation, ranging from 1 (strongly disagree) to 5 (strongly agree). All responses were treated with strict confidentiality and used solely for research purposes. Participation was voluntary, and no personal identifiable information was disclosed in the presentation of findings.

3. Results and Discussion

Figure 1 presents the gender distribution of respondents in the survey on sports participation and attitudes among Foundation Studies students. The data indicate that the majority of respondents were female, comprising 141 out of 171 participants, which represents approximately 82% of the total sample. In contrast, only 30 male students responded, accounting for 18% of the sample. Thus, the mode of the gender distribution is female.

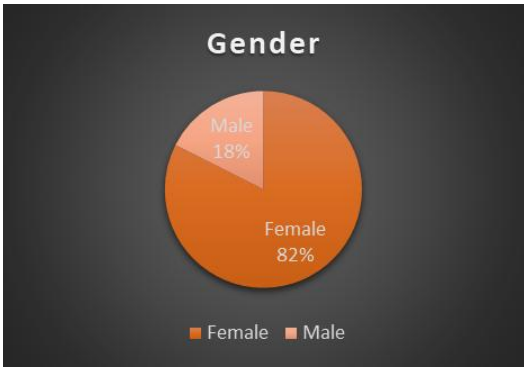

Fig. 1. Students Gender in Foundation Programme

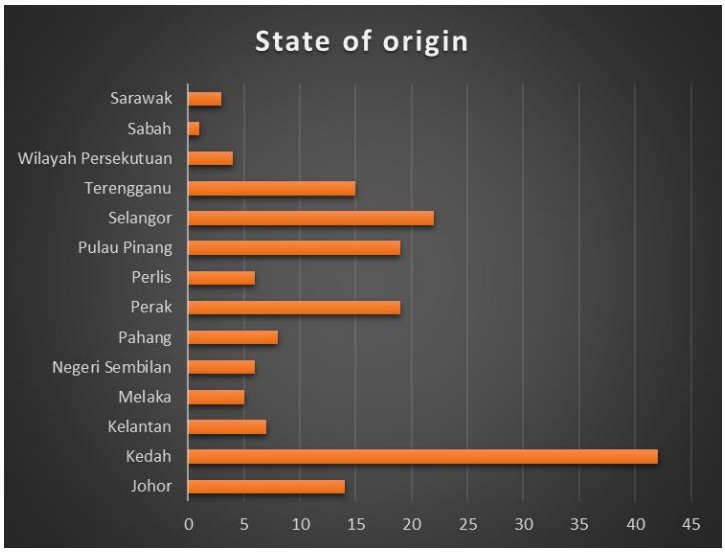

Fig. 2. Number of Students from Each State

Figure 2 illustrates the state of origin of the Foundation Studies students. The horizontal bar chart indicates that the most common state of origin is Kedah, with 42 out of 171 respondents (24.56%). This is followed by Selangor, accounting for 12.87% of the students. Both Pulau Pinang and Pahang have the same number of respondents, with 19 students each. The smallest representation is from Sabah, with only one student (0.585%) participating in the survey.

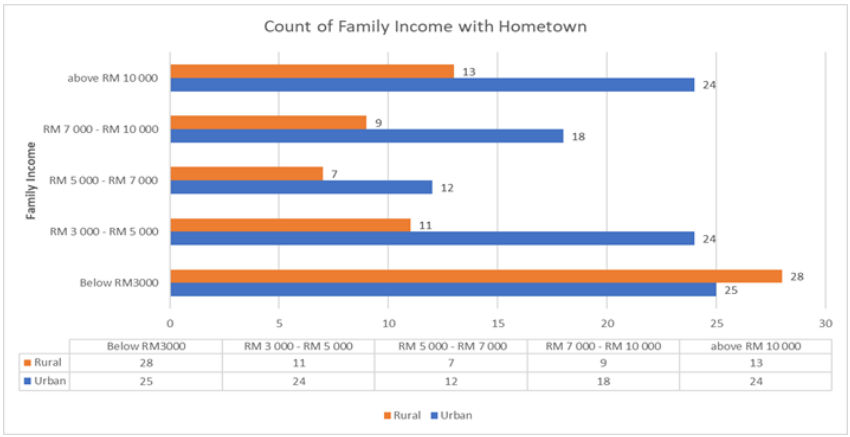

Fig. 3. Number of Students from Each State

Figure 3 compares the income distribution between students residing in urban and rural areas. The data show that students from urban areas have a higher median income of 81.6, compared to 53.9 for those from rural areas. The median is used as the preferred measure of

central tendency due to its robustness against outliers. In terms of variability, the interquartile range (IQR) for urban respondents is 42.8, while the rural group has a lower IQR of 28.2. These findings suggest that students from urban backgrounds generally report higher income levels than their rural counterparts.

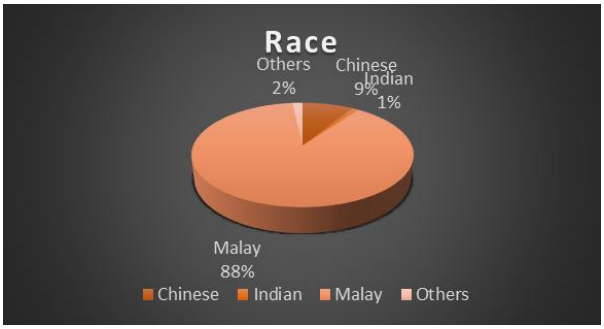

Fig. 4. Pie Students' Races

Figure 4 presents the racial composition of Foundation Studies students. The majority of respondents are Malay, comprising 151 students, which represents 88% of the total. Chinese students make up 9%, with 15 respondents, while students of other races account for 2%, represented by 3 students. The Indian student group is the smallest, with only 2 students, making up 1% of the overall population. Figure 5 indicates that the majority of students had participated in sports during their school years. A total of 133 respondents, or 72% of the sample, reported previous involvement in sports. In contrast, 38 students (28%) stated that they had not engaged in any sports activities during their time in school.

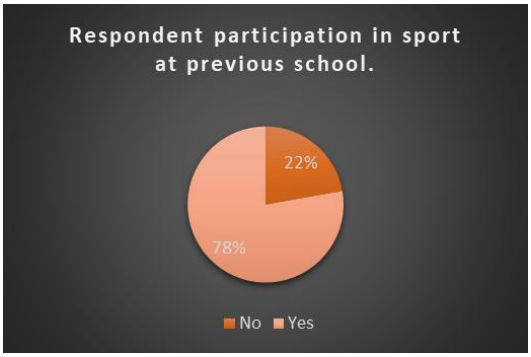

Fig. 5 Respondent participation in sport at previous school

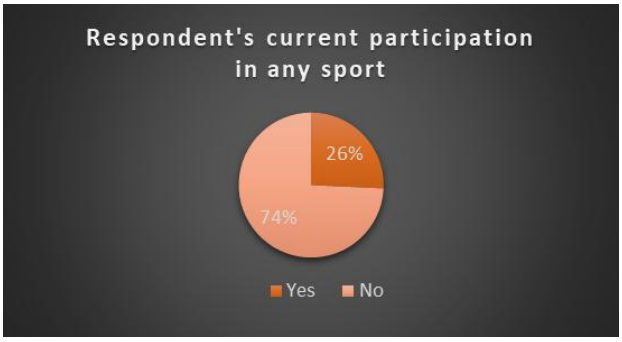

Fig. 6. Respondent current participation in any sport

Figure 6 shows the current level of sports participation among Foundation Studies students. Only 44 respondents (26%) reported that they are currently engaged in sports activities, while the majority—127 students (74%)—indicated that they are not participating in any sports.

These findings suggest that interest in sports has declined among university students, with only a small proportion actively participating in physical activities.
The pie chart in Figure 7 illustrates the types of sports currently played by Foundation Studies students. The most popular sport is badminton, with 40% of students indicating they play it regularly during their spare time, making it the mode of the dataset. Other sports reported include volleyball, basketball, netball, football, futsal, tennis, and golf. Among these, golf has the lowest participation rate, with only 1% of students engaging in it. This low participation may be attributed to the relatively high cost and limited accessibility associated with the sport.

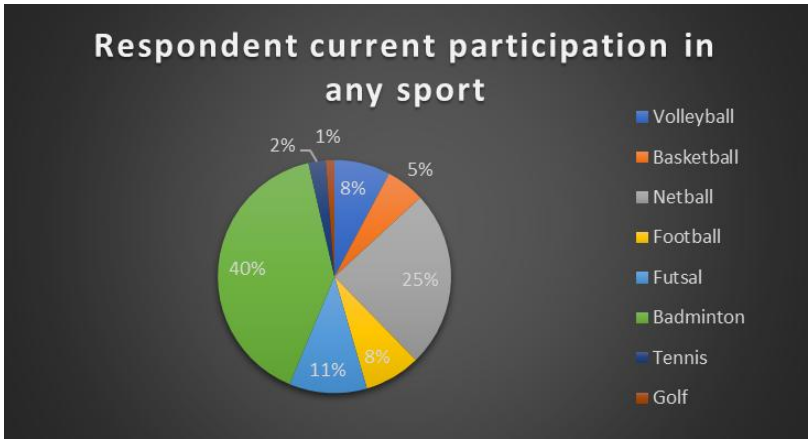

Fig. 7. Respondent current participation in any sport

Table 1. Range of Mean Score based on the Agreement of Statement About Reasons for Participating in Sport

Question	1	2	3	4	5	6	Mean
1	1	2	14	44	60	50	4.8129
2	0	3	14	30	57	67	5.0000
3	0	1	3	23	58	86	5.3158
4	0	1	4	26	55	85	5.2807

14	33	34	51	35	12	6	2.8655
15	6	13	41	60	31	20	3.9181
16	10	14	37	43	35	32	4.0234

Table 1 and Figure 8 illustrate the level of agreement among Foundation Studies students regarding the reasons for participating in sports. The Likert scale used ranged from 1 (strongly disagree) to 6 (strongly agree). Students were asked to rate 14 statements related to their motivations for participating in sports. The analysis shows a mean score of 4.590, indicating that most students expressed high levels of agreement with the positive reasons provided. This reflects a generally favorable attitude toward engaging in sports activities. Conversely, Table 2 and Figure 8 present the level of agreement for the reason's students choose not to participate in sports, based on statements numbered 15 to 30. The overall mean score for these statements is 2.7248, suggesting that most respondents leaned toward disagreement with the listed negative reasons. This implies that, while barriers to participation exist, they may not be strongly endorsed by most of the students. Notably, the mean for reasons supporting participation is considerably higher than that for non-participation, reinforcing the conclusion that students recognize the benefits of sports even if participation rates remain low.

4. Conclusion

This study examined the participation and attitudes toward sports among Foundation Studies students at Universiti Utara Malaysia. While a majority of students reported engaging in sports

during their school years, the level of current participation at the university is considerably lower. Although students generally expressed strong agreement with statements affirming the benefits of sports, such as enhancing physical health, reducing stress, and promoting social interaction, this positive perception has not fully translated into consistent engagement in sports activities. Badminton emerged as the most popular sport, while participation in sports like golf was minimal, largely due to accessibility and cost constraints. Barriers such as academic workload, limited time, and low personal motivation were among the key factors hindering participation. However, relatively low agreement with these negative factors suggests that many students remain open to participating in sports, provided that the right conditions and support systems are in place.

The findings have important implications for student development. Engaging in sports can significantly contribute to students' physical well-being, emotional resilience, and social connectedness—factors that are essential in fostering a holistic university experience. For Foundation Studies students in particular, who are at a transitional stage in both academic and personal development, active participation in sports can promote discipline, teamwork, time management, and coping skills that support long-term success in higher education and beyond. From a practical institutional perspective, universities play a critical role in shaping a culture that values and supports physical activity. Institutions should consider integrating sports more intentionally into student development programmes, including merit-based systems and co-curricular requirements. Improving access to facilities, offering diverse and inclusive sports options, and addressing logistical and motivational barriers can encourage more students to adopt active lifestyles. Awareness campaigns and peer-driven initiatives may also enhance participation by normalizing sports as a beneficial and routine part of campus life. In line with the broader goals of higher education and Technical and Vocational Education and Training (TVET), these efforts can foster a more balanced, health-conscious, and productive student population. Ultimately, this study highlights the importance of a proactive, student-centered approach to promoting sports engagement as a vital component of comprehensive education.

Abstrak

Industri kreatif di Malaysia, khususnya dalam bidang video dan filem, semakin berkembang pesat selari dengan pertumbuhan permintaan terhadap kandungan digital. Kerajaan telah menyediakan pelbagai program sokongan untuk graduan seni kreatif khususnya program Diploma Pengajian Video dan Filem yang ditawarkan di Politeknik METrO Tasek Gelugor (PMTG), namun masih berdepan cabaran seperti ketidakpadanan kemahiran, kekurangan peluang pekerjaan stabil, dan persaingan tinggi dalam pasaran kerja. Kajian ini bertujuan meninjau pasaran pekerjaan bagi graduan dalam bidang ini, dengan fokus kepada jenis pekerjaan, keperluan industri, dan keberkesanan kurikulum semasa. Seramai 45 orang responden, graduan daripada Politeknik METrO Tasek Gelugor telah terlibat melalui soal selidik yang dilaksanakan secara dalam talian bagi tiga (3) sesi pengajian. Hasil kajian menunjukkan graduan memiliki potensi tinggi dalam jawatan seperti editor, pereka grafik, jurugambar dan videografer, dan peningkatan minat terhadap pekerjaan bebas. Kajian mencadangkan penambahbaikan kurikulum, penyediaan kursus digital tambahan serta penubuhan *platform freelancer* untuk meningkatkan kebolehpasaran graduan dalam industri kreatif.
Kata kunci: Industri kreatif; Pasaran pekerjaan; Kebolehpasaran graduan.

1. Pengenalan

Industri kreatif di Malaysia, terutamanya dalam bidang pengajian video dan filem, semakin berkembang pesat seiring dengan peningkatan permintaan terhadap kandungan digital, animasi, dan produksi filem. Kerajaan Malaysia, melalui program seperti Rangka Tindakan Ekosistem Kandungan Digital (DICE) dan inisiatif oleh *Malaysia Digital Economy Corporation* (MDEC), telah memberikan sokongan yang signifikan kepada sektor ini (Gobind Singh Deo, 2024). Walaupun industri ini menawarkan peluang yang banyak, terdapat cabaran besar bagi graduan Diploma Pengajian Video dan Filem dalam memperoleh pekerjaan yang stabil dan relevan dengan kemahiran yang mereka pelajari. Kajian ini bertujuan untuk meninjau pasaran pekerjaan bagi pemegang Diploma Pengajian Video dan Filem di Malaysia, serta untuk mengenal pasti peluang kerjaya yang wujud selepas graduasi. Dengan perkembangan teknologi dan media digital yang semakin pesat, terdapat perubahan dinamik dalam keperluan tenaga kerja, dengan syarikat-syarikat mencari bakat yang bukan sahaja memiliki kemahiran teknikal yang kukuh, tetapi juga kebolehan kreatif dan adaptif dalam industri yang sangat kompetitif.

Menurut Zainol (2017), isu kebolehpasaran graduan dalam bidang filem masih menjadi cabaran utama, terutamanya apabila graduan sukar mendapatkan pekerjaan yang bersesuaian dengan kelayakan mereka selepas tamat pengajian di institusi pengajian tinggi awam (IPTA). Kajian tersebut menekankan keperluan bagi penyelarasan antara kurikulum

akademik dan keperluan sebenar industri bagi memastikan graduan lebih bersedia untuk menghadapi pasaran kerja yang kompetitif. Menurut kajian oleh Jabatan Perangkaan Malaysia (2022), industri kreatif di negara ini dijangka terus berkembang, tetapi graduan dalam bidang ini perlu menghadapi realiti pasaran yang mencabar, termasuk keperluan untuk bekerja dalam pelbagai bentuk pekerjaan—termasuk sebagai pekerja bebas/*freelancer*, berbanding jawatan tetap. Melalui kajian ini, penulis bertujuan untuk mendapatkan gambaran yang lebih jelas mengenai cabaran dan peluang yang dihadapi oleh graduan dalam mencari pekerjaan, serta sejauh mana penyediaan pendidikan dalam pengajian video dan filem bersedia untuk memenuhi kehendak industri.

Dengan mengenal pasti aspek-aspek penting dalam perjalanan kerjaya mereka, kajian ini diharapkan dapat memberikan saranan yang berharga untuk meningkatkan lagi persediaan akademik dan latihan praktikal untuk graduan dalam bidang ini, sekaligus memperbaiki hubungan antara pendidikan dan industri kreatif. Kajian mengenai pasaran pekerjaan bagi pemegang Diploma Pengajian Video dan Filem di PMTG berfokus kepada beberapa masalah utama: Ketidakpadanan Kemahiran dengan Keperluan Industri: Graduan sering kali menghadapi kesukaran kerana kemahiran mereka tidak sepenuhnya memenuhi kehendak industri kreatif yang lebih mengutamakan kemahiran praktikal dan adaptasi dalam persekitaran yang berubah-ubah (Jabatan Perangkaan Malaysia, 2022). Kekurangan Peluang Pekerjaan Stabil: Banyak graduan mendapati peluang pekerjaan lebih bersifat kontrak atau freelance, yang menyukarkan mereka merancang kerjaya jangka panjang dan kestabilan kewangan (Goh & Tan, 2023). Persaingan Tinggi dalam Industri: Pertumbuhan pesat industri kreatif menyebabkan graduan bersaing dengan pekerja berpengalaman untuk jawatan yang terhad, menjadikan pasaran kerja lebih kompetitif (Gobind Singh Deo, 2024). Keterbatasan Pengalaman Industri: Keterbatasan pengalaman industri semasa pengajian menyebabkan graduan kurang berdaya saing dan kurang bersedia menghadapi tuntutan pasaran (MDEC, 2022).

Hesmondhalgh dan Baker (2020) menegaskan bahawa pekerjaan dalam industri kreatif sering dicirikan oleh ketidakstabilan, ketidakpastian, dan struktur kerja yang fleksibel, termasuk kerja kontrak dan bebas (*freelance*). Dalam konteks graduan bidang video dan filem, situasi ini mewujudkan cabaran dalam mendapatkan pekerjaan tetap dan merancang kerjaya jangka panjang, walaupun wujud permintaan tinggi terhadap kandungan media. Mereka juga menekankan bahawa kejayaan dalam industri ini sering bergantung kepada rangkaian sosial, pengalaman praktikal, dan keupayaan untuk menyesuaikan diri dengan kehendak industri yang sentiasa berubah.

Menurut Watson dan Ward (2021), peralihan daripada alam pengajian ke dunia kerja dalam industri kreatif merupakan satu proses yang mencabar bagi graduan media. Mereka mendapati bahawa ramai graduan menghadapi ketidakpastian berkaitan kerjaya, kekurangan bimbingan profesional, dan tekanan untuk membina rangkaian industri sejak awal. Kajian ini turut menunjukkan bahawa kejayaan awal kerjaya sering kali lebih dipengaruhi oleh pengalaman praktikal dan hubungan industri berbanding pencapaian akademik semata-mata. Oleh itu, penyedia pendidikan perlu memainkan peranan penting dalam memperkukuh hubungan industri dan menyediakan pendedahan dunia sebenar kepada pelajar. Kajian ini bertujuan untuk menilai pasaran pekerjaan bagi pemegang Diploma Pengajian Video dan Filem di PMTG dengan fokus kepada beberapa objektif utama:

a) Mengenal pasti jenis pekerjaan yang disandang oleh graduan dalam bidang video dan filem selepas menamatkan pengajian di peringkat diploma.
b) Mengenal pasti kemahiran yang diperlukan oleh industri yang mungkin tidak dipenuhi oleh kurikulum semasa bagi program Diploma pengajian Video dan Filem.
c) Menyediakan Cadangan Penambahbaikan: Memberikan cadangan yang konstruktif bagi meningkatkan hubungan antara pendidikan dan industri kreatif, termasuk penambahbaikan dalam program latihan industri dan kurikulum bagi meningkatkan kebolehpasaran graduan.

Responden kajian ini adalah seramai orang 45 pelajar yang telah bergraduat daripada program Diploma Pengajian Video dan Filem, di Jabatan Rekabentuk dan Komunikasi Visual, Politeknik METrO Tasek Gelugor. Graduan yang telah tamat belajar pada Sesi II 2021/2022 Sesi 1 2022/2023 dan Sesi II 2023/2024. Jadual di bawah menunjukkan maklumat demografi responden kajian ini yang terdiri 51 orang graduan atau alumni daripada program Diploma Pengajian Video dan Filem (DDV), di Jabatan Rekabentuk dan Komunikasi Visual 9JRKV), Politeknik METrO Tasek Gelugor (PMTG). Graduan yang telah tamat belajar pada Sesi 1 2021/2022, Sesi 2 2021/2022 Sesi 1 2022/2023, Sesi 2 2023/2024 dan Sesi 1 2024/2025.

Jadual 1. Maklumat demo grafik responden

Jantina	Frekuensi (f)	Peratusan (%)
Lelaki	30	66.7
Perempuan	15	33.3

Kelantan	1	2.2
Pulau Pinang	10	22.2
Sabah	1	2.2
WP KL	1	2.2
Kedah	4	8.9

HPNM	Frekuensi (f)	Peratusan (%)
>3.67	22	48.9
<3.67	17	37.8
>3.00	6	13.3

2. Metodologi

Kajian yang dijalankan adalah secara kuantitatif iaitu menggunakan borang soal selidik secara atas talian sebagai kaedah pengumpulan data. Soal Selidik (*Survey Questionnaire*). Objektif: Untuk mengumpul data daripada graduan yang telah menamatkan pengajian dalam bidang Video dan Filem mengenai pengalaman mereka dalam mencari pekerjaan dan persepsi mereka terhadap pasaran pekerjaan. Soalan: Soalan boleh meliputi topik seperti jenis pekerjaan yang dimasuki selepas graduasi dan pendapat mengenai kesiapsiagaan latihan yang diterima di institusi yang menawarkan latihan secara *Work Based Learning* (WBL).

Borang soal selidik dengan skala likert “Sangat Tidak Setuju” (1) hingga “Sangat Setuju” (5) diedarkan kepada pelajar bagi mendapatkan maklumat berkaitan kajian. Soal selidik yang diedarkan terdiri daripada 2 konstruk iaitu penilaian program dan penilaian keberkesanan program. Respon yang diambil digabungkan bagi memudahkan analisis data dimana jawapan bagi penyataan “Sangat Setuju” digabungkan dengan “Setuju” bagi mendapatkan satu respon positif iaitu setuju, manakala skala likert respon “Sangat Tidak Setuju” dan “Tidak Setuju” menunjukkan pendapat yang negatif dan tidak berkesan terhadap item kajian.

Rujukan Pengalaman Kerja Praktikal WBL turut digunakan di dalam penulisan kajian ini tujuannya adalah untuk mengkaji keberkesanan program latihan WBL dan pengaruhnya terhadap kebolehan graduan mendapatkan pekerjaan. Sebelum menjalankan kajian utama,

penulis telah menjalankan kajian rintis dengan menggunakan sampel kecil untuk menguji kesesuaian instrumen yang digunakan. Ini memberi peluang untuk mengubah suai soal selidik, memastikan soalan yang diajukan jelas, serta menilai masa yang diperlukan untuk melengkapkan kajian. Instrumen ini akan memberi gambaran menyeluruh mengenai pilihan kerjaya graduan dalam industri video dan filem selepas tamat pengajian. Ia membantu untuk merangka cadangan yang lebih tepat untuk memperbaiki sistem pendidikan dan sokongan pasaran kerja bagi pelajar lepasan diploma pengajian video dan filem di Politeknik Malaysia. Hasil dapatan kajian akan diterangkan menggunakan statistik deskriptif (peratusan) dan carta/graf.

3. Dapatan dan Perbincangan

Hasil analisis soal selidik responden bagi konstruksi jawatan responden seperti di Jadual 2. Maklumat jawatan responden:

Jadual 2. Maklumat jawatan responden

Kategori	Jawatan/ Fungsi	Bilangan	Peratusan (%)
Production	*Photographer*	5	11.1
	Videographer	5	11.1
	Crew Production, Operator Switcher, Technical Production	5	11.1
	Editor	4	8.9
	Freelance Photographer	2	4.4
	Cinematographer, Operator Camera, Operator Drone,	2	4.4
	Graphic Designer	1	2.2
Social media practitioner	*Creative Management*	4	8.9
	Social Media Manager + Videographer + Host Live	3	6.6
	Kerani/ *Clerk/ Administrative officer/ Management Staff*	3	6.6
	Intern Degree	2	4.4
Administration	*Health & Wealth Advisor*	1	2.2
	Purchasing Department	1	2.2
	Customer Assistant	1	2.2
	Pekerja Biasa	1	2.2
	Pembantu Penyelia UIDM	1	2.2
	HR dan *Production Manager*	1	2.2
	Rintis *Project* (TNB)	1	2.2
Entrepreneur	CEO, Produksi Sendiri (Noite Elevé)	2	4.4
	Jumlah	45	100

Berikut adalah analisis data pekerjaan berdasarkan jumlah peratusan yang diberikan:

Photographer dan Videographer (22%) merupakan peranan dengan keutamaan tertinggi, menggambarkan permintaan yang tinggi untuk kemahiran video dan fotografi memandangkan peningkatan kandungan digital, media sosial, dan siaran langsung. *Editor, Graphic Designer, Cinematographer* (15.5%) menunjukkan keperluan besar untuk bakat kreatif visual. *Crew Production, Operator Switcher, Technical Production (11%)* menunjukkan keperluan terhadap kemahiran teknikal dan operasi di produksi.

Pengurusan kreatif dan social media menunjukkan frekuensi (15.5%), ini mengindikasikan peranan yang semakin meluas tetapi bersifat umum, di mana wujudnya pelbagai platform pengurusan kandungan dan alat automasi yang memudahkan tugas tanpa memerlukan kepakaran mendalam. Graduan turut memilih kerjaya di bidang pentadbiran pejabat atau pengkeranian (6.6%). Ada graduan yang menyambung pengajian di peringkat ijazah (4.4%). Sebahagian besar pekerjaan yang disenaraikan (9 jenis) berada pada 2.2%, menunjukkan pembahagian yang sama rata antara pelbagai bidang kerja.

Graduan PMTG turut menjadi usahawan dalam bidang penerbitan visual kreatif (4.4%), jumlah ini agak kecil kerana bidang ini memerlukan modal permulaan yang agak tinggi untuk peralatan seperti kamera profesional, komputer berkuasa tinggi, dan perisian penyuntingan, selain kemahiran teknikal dan pengalaman yang mantap. Tambahan pula, persaingan dalam industri ini sangat sengit dan bergantung kuat kepada rangkaian pelanggan, kredibiliti jenama, serta pemasaran yang konsisten.

Jadual 3. Maklumat Kerjaya Responden

Gaji	Frekuensi (f)	Peratusan (%)
RM		
3500 dan ke atas	5	11.1
3500.00-2500.00	9	20
2500.00-1500.00	15	33.3
900.00-1500.00	16	35.6

5	25	55.6
4	13	28.9
3	7	15.6
Menghargai perubahan persekitaran dan sosial, teknologi, legenda tempatan dan warisan budaya yang memberi inspirasi kepada pembangunan produksi video	Frekuensi (f)	Peratusan (%)
5	16	35.6
4	19	42.2
3	8	17.8
2	1	2.2
Menambah baik kemahiran pembelajaran sepanjang hayat dan kemahiran pengurusan maklumat	Frekuensi (f)	Peratusan (%)
5	23	51.1
4	14	31.1
3	7	15.6
2	1	2.2

4. Kesimpulan

Berdasarkan kepada hasil dapatan kajian, jelas menunjukkan bahawa program Diploma Pengajian Video dan Filem yang dijalankan di PMTG menghasilkan graduan yang yang mahir di industri media kreatif. Jawatan seperti *Editor, Graphic Designer, Photographer*, dan peranan videografi mendominasi senarai, menonjolkan permintaan tinggi dalam sektor ini. "*Freelance*" dan variasinya mencerminkan minat terhadap pekerjaan yang tidak terikat dengan institusi secara rasmi, masa dan lokasi yang terhad. Pelbagai jawatan pada tahap 2.2% menunjukkan permintaan untuk kemahiran berkaitan industri kreatif, seperti teknikal, pemasaran, dan pengurusan. Industri kreatif dan media seperti *Editor, Graphic Designer, Photographer*, dan *Videographer* menunjukkan permintaan yang signifikan. Ia didorong oleh latihan industri berformatkan *Work-Based Learning* (WBL) yang telah dipraktiskan di PMTG. Pekerjaan bebas dan variasinya seperti *Freelance Photographer* serta peranan kreatif lain menunjukkan minat terhadap fleksibiliti pekerjaan. Cadangan penulis agar diadakan satu *Platform* khas untuk Pekerja Bebas Tempatan graduan TVET POLYCC dalam bidang kreatif untuk menghubungkan pekerja bebas *(freelancer)* dengan majikan tempatan. Bagi meningkatkan lagi kualiti dan kemahiran media sosial dan digital berikutan peningkatan minat dan keperluan bagi kerjaya ini, silibus di politeknik perlu dimurnikan dengan memberi latihan dan kemahiran berasaskan latihan media sosial dengan menyediakan kursus pendek tentang strategi pemasaran digital, penghasilan kandungan, dan analitik media sosial. Bantuan Perniagaan dan sokongan seperti bantuan cukai, pembiayaan mikro, atau panduan perniagaan kepada *freelancer* atau pekerja bebas amat diperlukan terutamanya bagi memulakan kerjaya mereka.

Abstrak

Kemudahan dan perkhidmatan yang berkualiti dalam sesebuah organisasi pendidikan adalah penting bagi memenuhi keperluan dan memberi kepuasan kepada setiap pengguna. Kajian ini dijalankan untuk mengkaji tahap kepuasan pelajar terhadap kemudahan perkhidmatan sukan & rekreasi, kantin/kafeteria dan perpustakaan yang disediakan di Politeknik Tuanku Sultanah Bahiyah (PTSB) bagi sesi sesi 1:2024/2025. Kajian ini melibatkan seramai 1624 responden yang terdiri dari empat jabatan utama iaitu Jabatan Awam, Jabatan Elektrik, Jabatan Mekanikal dan Jabatan Perdagangan. Borang soal selidik digunakan sebagai instrumen utama dan diedarkan kepada semua responden dalam kajian ini. Data dianalisis dengan menggunakan perisian *Statistical Packages for Social Sciences Version* 20.0 (SPSS). Hasil dari analisis data yang diperolehi menunjukkan tahap kepuasan pelajar PTSB terhadap kemudahan perkhidmatan sukan & rekreasi dan perpustakaan yang disediakan di PTSB pada sesi 1:2024/2025 adalah tinggi. Walau bagaimanapun dapatan bagi perkhidmatan kantin/ kafeteria menunjukkan tahap yang sederhana iaitu 83.84%. Penambahbaikan perlu dilaksanakan bagi menjamin kualiti perkhidmatan terutama di kantin/ kafeteria PTSB terutama dari segi pemilihan pengusaha kantin/ kafeteria .
Kata kunci: Kepuasan; Kemudahan; Perkhidmatan.

1. Pengenalan

Kemudahan ditakrifkan sebagai elemen yang disediakan untuk menyokong keselesaan dan kemudahan oleh setiap pengguna. Dalam konteks Pelan Pembangunan Pendidikan 2001–2010, Kementerian Pelajaran Malaysia menekankan bahawa setiap institusi pendidikan perlu dilengkapi dengan kemudahan infrastruktur yang mencukupi, berkualiti dan berkesan bagi menyokong pelaksanaan kurikulum secara optimum. Menurut kenyataan Timbalan Perdana Menteri ketika itu, Tan Sri Muhyiddin Yassin (Berita Harian, 2007), kerajaan telah memperuntukkan pelbagai kelengkapan dan kemudahan bagi menjayakan inisiatif Satu Murid, Satu Kerusi, Satu Meja dan Satu Set Buku Teks demi memastikan keselesaan murid di sekolah terjamin dan memuaskan. Sesebuah institusi pendidikan akan menyediakan pelbagai kemudahan sepert bilik kuliah, perpustakaan, kafeteria, asrama pelajar, sukan & rekreasi, internet dan sebagainya bagi memastikan keselesaan pelajar.

Kajian yang dilaksanakan oleh Nurulhuda, Chai dan Fazli (2009), perpustakaan memainkan peranan yang amat penting sebagai pusat inovasi, pengetahuan dan kebudayaan dalam sesebuah institusi pendidikan. Perpustakaan menjadi medium utama untuk memupuk keterampilan kendiri pelajar dalam mengakses maklumat secara berkesan dan berdikari. Perpustakaan juga berfungsi mengumpul, memilih, menyusun dan menyebarkan bahan

pengajaran dan pembelajaran dalam pelbagai format, termasuk bahan bercetak seperti buku, jurnal dan laporan; serta bahan bukan bercetak seperti sumber digital, cakera padat, video pendidikan, dan pangkalan data dalam talian (Ismail & Zawiyah, 2011). Suasana ruang yang tenang, tersusun dan dilengkapi kemudahan asas seperti meja belajar, sokongan internet, pencahayaan yang baik serta perkhidmatan kakitangan mesra pelanggan merupakan antara faktor yang meningkatkan kepuasan pengguna (Kassim, 2010). Kajian ini perlu untuk memastikan tahap kemudahan perkhidmatan perpustakaan moden juga semakin bergerak ke arah digitalisasi, sekali gus memberi kemudahan kepada pelajar untuk mengakses maklumat di luar waktu operasi fizikal.

Keperluan terhadap makanan merupakan suatu aspek asas dalam kehidupan manusia yang tidak boleh dinafikan. Pengambilan makanan yang tidak mencukupi dan seimbang, akan mengakibatkan fungsi tubuh badan akan terjejas, seterusnya mengganggu keupayaan individu untuk menjalani kehidupan harian dengan efektif. Menurut Abdul Wahid dan Mazilah (2011), cara pemakanan yang baik dan teratur diperlukan bagi memastikan pertumbuhan yang normal serta sokongan kepada aktiviti harian yang mencabar dalam kehidupan moden masa kini. Justeru, isu pemakanan perlu diberi perhatian serius dalam setiap lapisan masyarakat, terutamanya dalam kalangan institusi pendidikan dan organisasi yang menjaga kebajikan warganya.

Menurut Kamus Pelajar Edisi Kedua (2007), kafeteria didefinisikan sebagai sejenis restoran di mana pelanggan perlu mengambil sendiri makanan atau minuman yang diingini dan membuat pembayaran sebelum makan. Kemudahan kafeteria yang lengkap dan menarik memainkan peranan penting dalam menyokong keperluan harian pelajar, terutamanya dari segi pemakanan yang seimbang. Sebuah kafeteria perlu dilengkapi dengan keperluan asas seperti meja, kerusi, kipas atau sistem pengudaraan yang baik. Tahap kebersihan perlu diutamakan bagi menjamin keselesaan dan kesihatan pelanggan. Oleh itu, pengurusan institusi perlu bertanggungjawab bagi memastikan kualiti makanan yang disediakan serta penyelenggaraan kemudahan fizikal di kafeteria berada pada tahap yang memuaskan.

Penyediaan kemudahan sukan di setiap institusi pendidikan adalah penting bagi menggalakkan pelajar bergiat aktif dalam aktiviti fizikal. Akses kepada kemudahan sukan yang berkualiti boleh menjadi faktor utama dalam keupayaan untuk memenuhi permintaan semasa dan melahirkan pelajar-pelajar yang berpotensi dalam sukan. Sukan biasakan akan merujuk kepada aktiviti fizikal yang dilakukan samada untuk pertandingan atau aktiviti harian. Oqundairo (2010), telah mengenal pasti peralatan adalah salah satu perkara yang penting dalam meningkatkan kemahiran sukan atau permainan. Dengan peralatan yang lengkap akan dapat merangsang minat pengguna dan dapat meningkatkan lagi kemahiran. Kekurangan peralatan atau kemudahan sukan & rekreasi akan mengurangkan minat pelajar sekaligus mengurangkan penyertaan pelajar dalam satu-satu pertandingan.

Menurut Maquire & Pearton (2000), penyediaan kemudahan dan perkhidmatan sukan & rekreasi akan meningkatkan lagi motivasi pelajar bagi penyertaan dalam pertandingan/permainan. Dalam kajian Conant (2017) menyatakan bahawa pengurusan dan penyenggaraan yang sistematik bagi setiap kemudahan dan perkhidmatan sukan & rekreasi akan dapat memanjangkan jangka ayat peralatan. Ini perlu bagi memastikan peralatan sentiasa berfungsi setiap kali pelajar ingin menggunakan kemudahan tersebut. Rintaugu (2013) dalam kajian beliau telah mendapati bahawa kemudahan peralatan sukan adalah satu fasiliti yang paling penting dalam sesebuah institusi pendidikan bagi memastikan pelajar-pelajar dapat menjalankan aktiviti fizikal dan bersukan dengan baik mengikut kemampuan mereka dan sekaligus dapat menyertai berbagai pertandingan yang dianjurkan. Pelajar yang bergiat aktif dalam sukan dan aktiviti fizikal akan dapat membantu pelajar dari segi aspek pembelajaran yang berkesan dan sekaligus akan meningkatkan prestasi pengajaran guru terutama dalam pelaksanaan kerja kursus dan aktiviti pengajaran yang lebih berkualiti,

(Lockwood & Wohl, 2012; Ding & Sugiyama, 2017; Bazelais & Doleck, 2018; Barney & Leavitt, 2021).

Kajian ini juga turut menyokong tahap kepuasan atau ketidakpuasan seseorang pekerja yang mempunyai kaitan dengan penilaian tentang kualiti sesuatu perkhidmatan (Parasuranam et al., 1988). Alias dan Nasurdin (2011) mendapati bahawa kemudahan tempat kerja yang lengkap dan perkhidmatan sokongan yang efisien menyumbang kepada tahap kepuasan kerja yang tinggi di kalangan pekerja. Manakala, kajian oleh Azman et al. (2019) ke atas institusi pendidikan mendapati bahawa faktor seperti kebersihan, capaian internet, keselamatan, dan layanan pentadbiran memainkan peranan penting dalam persepsi staf terhadap persekitaran kerja mereka. Kajian ini dijalankan bagi menilai tahap kepuasan pelajar terhadap kemudahan dan perkhidmatan sukan & rekreasi, perpustakaan dan kantin/ kafeteria di Politeknik Tuanku Sultanah Bahiyah disamping megenalpasti aspek-aspek yang tidak mencapai aras Petunjuk Prestasi Utama (KPI) 85%.

2. Metodologi

Kajian ini menggunakan pendekatan kuantitatif dengan reka bentuk tinjauan yang melibatkan 1,624 orang pelajar PTSB daripada empat jabatan iaitu Awam, Elektrik, Mekanikal dan Perdagangan. Instrumen kajian adalah borang soal selidik yang dibina khusus untuk menilai tahap kepuasan pelajar terhadap kemudahan dan perkhidmatan di PTSB. Dengan merujuk Jadual 1, carta menunjukkan saiz sampel minimum yang diperlukan bagi mewakili populasi pelajar semasa PTSB berjumlah 3027 pelajar. Jumlah pelajar yang telah menjawab soal selidik adalah 1624 pelajar dan telah melebihi bilangan sampel minimum yang diperlukan.

Jadual 1. Jadual Saiz Sampel (Krejcia & Morgan, 1970)

N	*S*	*N*	*S*	*N*	*S*
10	10	220	140	1200	291
15	14	230	144	1300	297
20	19	240	148	1400	302
25	24	250	152	1500	306
30	28	260	155	1600	310
35	32	270	159	1700	313
40	36	280	162	1800	317
45	40	290	165	1900	320
50	44	300	169	2000	322
55	48	320	175	2200	327
60	52	340	181	2400	331
65	56	360	186	2600	335
70	59	380	191	2800	338
75	63	400	196	3000	341
80	66	420	201	3500	346
85	70	440	205	4000	351
90	73	460	210	4500	354

200	132	1000	278	75000	382
210	136	1100	285	1000000	384

Note.—*N* is population size. *S* is sample size.

Kajian dijalankan secara deskriptif, dan soal selidik tersebut terbahagi kepada empat bahagian iaitu Bahagian A merangkumi maklumat demografi (umur, jantina, kaum, jabatan dan program), manakala Bahagian B, C dan D menilai tahap kepuasan terhadap kemudahan sukan/ rekreasi, kantin/ kafeteria dan perpustakaan. Skala pengukuran yang digunakan ialah skala Likert bagi membolehkan responden menyatakan tahap persetujuan terhadap setiap item. Pecahan bahagian soal selidik diringkaskan dalam Jadual 2.

Jadual 2. Bilangan Item Soal Selidik

Bahagian		Item
B	B1	Kemudahan asas sukan dan rekreasi mencukupi
	B2	Kemudahan asas sukan dan rekreasi mudah diperolehi
	B3	Kemudahan asas sukan dan rekreasi berfungsi dengan baik
	B4	Tempat dan persekitaran sesuai untuk aktiviti sukan
	B5	Layanan pegawai adalah baik dan mesra
C	C1	Kemudahan asas di kantin/kafeteria mencukupi
	C2	Tahap kebersihan di kantin/kafetria adalah baik
	C3	Kualiti makanan dan minuman adalah memuaskan
	C4	Harga makanan/minuman/adalah berpatutan
	C5	Layanan kaunter adalah baik dan mesra
D	D1	Persekitaran dan ruang belajar perpustakaan adalah kondusif
	D2	Sumber/bahan rujukan terkini
	D3	Sumber/bahan rujukan mencukupi
	D4	Perkhidmatan wifi adalah memuaskan
	D5	Layanan pegawai perpustakaan adalah baik

Nilai Alpha Cronbach digunakan bagi menguji tahap kebolehpercayaan dalam kajian ini yang mempunyai julat antara 0.00 – 1.00. Tahap kebolehpercayaan akan berada pada tahap yang baik dan berkesan apabila nilai julat menghampiri 1.0. Sekiranya nilai julat menghampiri 0.00, ia menunjukkan tahap kebolehpercayaan yang rendah dan kurang berkesan (Yusof, 2004). Jadual 3 menunjukkan panduan dalam menganalisis data kajian.

Jadual 3. Jadual Interprestasi Skor Alpha Cronbach (Bond & Fox, 2015)

Skor Alpha Cronbach	Tahap Kebolehpercayaan
0.8 hingga 1.0	Sangat baik dan efektif dan tahap konsistensi yang tinggi
0.7 hingga 0.8	Baik dan boleh diterima
0.6 hingga 0.7	Boleh diterima
< 0.6	Item perlu dibaiki
< 0.5	Item perlu digugurkan

3. Keputusan dan Perbincangan

a. Analisis Latar Belakang Responden

Berdasarkan Jadual 4, analisis taburan jantina menunjukkan bahawa seramai 53.39% daripada jumlah keseluruhan responden adalah terdiri daripada pelajar perempuan, manakala baki 46.61% pula merupakan pelajar lelaki. Secara lebih terperinci, jumlah pelajar perempuan adalah seramai 867 orang, manakala pelajar lelaki pula berjumlah 757 orang. Perbezaan ini menunjukkan bahawa terdapat sedikit kelebihan dalam penyertaan responden perempuan berbanding lelaki dalam kajian ini. Walaupun jurang peratusan antara kedua-dua kumpulan tidak terlalu besar, namun ia memberikan gambaran bahawa pelajar perempuan lebih ramai atau lebih cenderung untuk terlibat dalam kajian soal selidik ini. Taburan ini juga penting bagi memastikan bahawa analisis data kajian dapat mewakili kedua-dua perspektif jantina secara seimbang, sekaligus meningkatkan kebolehpercayaan dapatan kajian yang melibatkan kepuasan pelajar terhadap kemudahan dan perkhidmatan yang disediakan.

Jadual 4. Taburan responden mengikut jantina

Jantina	Kekerapan	Peratusan
Lelaki	757	46.61
Perempuan	867	53.39
Jumlah	1624	100

b. Analisis Kebolehpercayaan

Jadual 5 menunjukkan kesemua nilai pekali Cronbach's Alpha yang diperoleh bagi setiap pembolehubah dalam kajian ini melebihi nilai minimum 0.7, iaitu tahap yang lazimnya diterima sebagai penunjuk kebolehpercayaan yang baik dalam kajian sosial dan pendidikan. Keputusan ini secara langsung menunjukkan bahawa instrumen soal selidik yang digunakan mempunyai tahap konsistensi dalaman yang tinggi serta mampu mengukur konstruk yang dikaji secara tepat dan menyeluruh. Menurut Hair, Black, Babin dan Anderson (2010), nilai Cronbach's Alpha yang melebihi 0.7 menandakan bahawa item-item dalam satu dimensi atau pembolehubah adalah seragam dan saling berkaitan, sekali gus menunjukkan kestabilan dalam respons responden terhadap soalan-soalan yang dikemukakan. Dalam konteks kajian ini, keputusan tersebut memberi keyakinan bahawa setiap konstruk yang diuji sama ada berkaitan kemudahan fizikal, perkhidmatan sokongan atau aspek persekitaran adalah sah dan boleh dipercayai. Keutuhan kebolehpercayaan ini penting kerana ia menjadi asas kepada kesahan inferens yang dibuat daripada data yang dikumpulkan.

Jadual 5. Jadual Interprestasi Skor Alpha Cronbach (Bond & Fox, 2015)

Perkhidmatan dan Kemudahan	Bilangan Item	Cronbach alpha
Sukan/Rekreasi	5	0.911
Kantin & Kafeteria	5	0.896
Perpustakaan	5	0.901

3.3 Keputusan dan Perbincangan

Bahagian B: Sukan/Rekreasi

BHGN	PERKARA		SKOR (%) PELAJAR
B1	Kemudahan asas sukan dan rekreasi mencukupi		86.08
B2	Kemudahan asas sukan dan rekreasi mudah diperolehi		85.16
B3	Kemudahan asas sukan dan rekreasi berfungsi dengan baik		89.35
B4	Tempat dan persekitaran sesuai untuk aktiviti sukan		93.41
B5	Layanan pegawai adalah baik dan mesra		92.05
		PURATA	89.21

Dapatan menunjukkan bahawa kesemua lima item yang dinilai dalam Bahagian B telah berjaya melepasi penanda aras Petunjuk Prestasi Utama (KPI) iaitu 85% yang telah ditetapkan oleh pihak institusi. Ini memberi gambaran bahawa tahap kepuasan pelajar terhadap kemudahan sukan dan rekreasi di PTSB berada pada tahap yang sangat memuaskan. Secara keseluruhan, skor purata yang dicapai adalah 89.21%, ini menunjukkan majoriti pelajar PTSB mempunyai persepsi positif terhadap kemudahan yang disediakan seperti padang bola, gelanggang sukan, gimnasium, serta ruang riadah yang kondusif dan mudah diakses oleh pelajar.

Bahagian C: Kantin/ Kafeteria

BHGN	PERKARA	SKOR (%) PELAJAR
C1	Kemudahan asas di kantin/ kafeteria mencukupi	86.88
C2	Tahap kebersihan di kantin/ kafeteria adalah baik	80.67
C3	Kualiti makanan dan minuman adalah memuaskan	79.93

C4	Harga makanan/minuman/adalah berpatutan		79.93
C5	Layanan kaunter adalah baik dan mesra		91.81
		PURATA	83.84

Berdasarkan maklum balas pelajar, didapati hanya dua item yang melepasi aras Petunjuk Prestasi Utama (KPI) iaitu 85%. Ini menunjukkan kebanyakan responden kurang berpuas hati dengan aspek kebersihan, makanan dan harga makanan di kafeteria PTSB. Perkhidmatan yang tidak memuaskan ini sekaligus akan menjejaskan tahap kesihatan, emosi dan tumpuan pelajar dalam pembelajaran. Zamri (2000), menyatakan bahawa kafeteria merupakan satu tempat yang penting bagi pelajar mendapatkan makanan yang baik dan rehat yang berkualiti bersama teman-teman. Menurut Abu Bakar dan Noraini Azuani (2010), pemakanan yang seimbang bukan sahaja penting untuk kesihatan fizikal, malah turut mempengaruhi sahsiah dan prestasi pelajar.

Bahagian D: Perpustakaan

BHGN	PERKARA	SKOR (%) PELAJAR
D1	Persekitaran dan ruang belajar perpustakaan adalah kondusif	96.55
D2	Sumber/bahan rujukan terkini	94.09
D3	Sumber/bahan rujukan mencukupi	94.95
D4	Perkhidmatan wifi adalah memuaskan	94.95
D5	Layanan pegawai perpustakaan adalah baik	77.03
	PURATA	91.51

Keputusan analisis data bagi item D1, D2, D3 dan D4 berjaya melepasi Petunjuk Prestasi Utama (KPI**)** iaitu 85% yang telah ditetapkan. Dengan skor purata keseluruhan adalah 91.51%, menunjukkan bahawa responden memberikan maklum balas yang positif, sekaligus menunjukkan tahap persetujuan yang tinggi terhadap item yang dikemukakan dalam soal selidik. Item D5 hanya mencapai 77.03% dan tidak mencapai KPI yang telah ditetapkan.Item ini memerlukan perhatian dan penambahbaikan dari pihak pengurusan. Secara keselurugan bagi item D dapat membuktikan bahawa kemudahan perpustakaan di PTSB diterima baik oleh pelajar, meskipun masih terdapat ruang untuk penambahbaikan dalam aspek tertentu. Dapatan ini menyokong kajian oleh Nurulhuda, Chai dan Fazli (2009) yang mendapati bahawa keselesaan ruang, ketersediaan tempat duduk, dan kemudahan wifi memberi kesan kepada pengalaman pelajar di perpustakaan. Shafee et al. (1995), juga menegaskan bahawa perpustakaan merupakan prasarana penting dalam meningkatkan budaya membaca dan akses kepada ilmu pengetahuan. Oleh yang demikian, tahap kepuasan pelajar terhadap kemudahan perpustakaan bukan sahaja menjadi indikator kepada keberkesanan fungsi perpustakaan sebagai pusat sokongan akademik, malah mencerminkan komitmen institusi dalam menyediakan persekitaran pembelajaran yang menyeluruh dan berkualiti.

4. Kesimpulan

Secara keseluruhannya, dapatan menunjukkan bahawa ketiga-tiga pembolehubah yang dikaji iaitu kepuasan pelajar terhadap kemudahan dan perkhidmatan sukan/ rekreasi, perpustakaan serta kantin/ kafeteria amat mempengaruhi tahap kepuasan keseluruhan pelajar di Politeknik Tuanku Sultanah Bahiyah. Kajian mendapati bahawa tahap kepuasan pelajar PTSB terhadap kemudahan perkhidmatan sukan/ rekreasi dan perpustakaan amat memuaskan dimana peralatan dan kemudahan yang disediakan adalah mencukupi. Ini menunjukkan bahawa PTSB dapat menyediakan fasiliti sukan dan perpustakaan yang mencukupi untuk kegunaan

setiap pelajar. Tahap kepuasan pelajar PTSB terhadap kemudahan dan perkhidmatan kantin/ kafeteria adalah ditahap sederhana.

Bagi sasaran Petunjuk Prestasi Utama (KPI), pelajar 100% berpuashati dengan kemudahan dan perkhidmatan sukan & rekreasi yang disediakan di PTSB berdasarkan kepada kelima-lima item melebihi KPI yang ditetapkan 85%. Bagi kemudahan dan perkhidmatan perpustakaan, hanya satu item yang tidak mencapai KPI 85% dan selebihnya melebihi sasaran yang ditetapkan. Pelajar tidak berpuas hati dengan kemudahan dan perkhidmatan kantin/ kafeteria terutamanya bagi kualiti makanan dan minuman, harga makanan dan minuman dan tahap kebersihan. Bagi meningkatkan tahap kepuasan pelajar terhadap perkhidmatan makanan di kantin/ kafeteria PTSB, pihak pengurusan PTSB perlu mengkaji terlebih dahulu rekod pengusaha kantin/ kafeteria sebelum kontrak diberikan kepada mereka. Pemantauan yang berterusan perlu dilakukan bagi memastikan harga makanan di kantin/ kafeteria adalah pada kadar yang munasabah. Pihak PTSB juga boleh berkolaborasi dengan pihak Kementerian Kesihatan Malaysia (KKM) bagi menjamin tahap kebersihan yang memuaskan.

A CDIO-BASED APPROACH TO DEVELOPING A CREATIVE MARKETING PLAN FOR STUDENT INNOVATION PRODUCTS

Damaisari Mohd Nawi*

Commerce Department, Politeknik Port Dickson, 71050 Si Rusa, Negeri Sembilan, Malaysia

*Corresponding author e-mail address: damaisari@polipd.com.my

Abstract

This study aims to explore the effectiveness of the CDIO (Conceive, Design, Implement, Operate) approach in developing creative marketing plans by polytechnic students to promote their innovative products. The identified issue is the lack of creativity, originality, and structured marketing elements in the promotional materials produced by students. This action research involved 42 students as primary respondents through questionnaire distribution and document review of the marketing materials produced. The findings show that the CDIO approach enhances students' understanding of the planning, design, implementation, and operation processes in marketing material development. Assessment results indicate improvements in creativity, message clarity, and promotional effectiveness. This study recommends broader integration of the CDIO approach into the marketing curriculum to enhance students' competitiveness and practical skills holistically.
Keywords: CDIO; Creative marketing plan; Product innovation.

1. Introduction

In the era of modern marketing driven by digital and creative platforms, the ability to produce appealing and effective marketing materials is a vital skill for students in the field of marketing. However, it has been found that many students still lack exposure and training in developing innovative and impactful marketing content. The CDIO (Conceive, Design, Implement, Operate) approach, which emphasizes real-world project-based learning, can help students develop practical skills in real-world contexts. This action research focuses on the development of creative marketing materials by students to promote their innovative products using the CDIO approach.

The objectives of this study are:

a) To evaluate students' understanding of the CDIO approach in developing creative marketing plans.
b) To identify the impact of the CDIO approach on the quality of marketing materials produced by students.

The CDIO approach has been widely used in engineering education and is now being applied in various fields including marketing and technical education. According to Crawley et al. (2011), CDIO supports problem-based and outcome-oriented learning. In the context of polytechnic education, this approach provides opportunities for students to actively engage in the entire project development process from conceptual planning to implementation and evaluation. A study by Nordin et al. (2018) indicated that the use of CDIO in teaching helps enhance creative thinking and problem-solving skills among students.

Kotler & Keller (2016) emphasize the importance of experiential learning in marketing, aligning with CDIO's hands-on approach. Laurillard (2012) argues that iterative project-based learning (as in CDIO) enhances students' ability to develop customer-centric marketing strategies.

Gremler et al. (2000) found that simulated and real-world marketing projects improve students' ability to apply theoretical knowledge practically, a core principle of CDIO.

Innovation products developed by students require creative and adaptive marketing strategies due to their novel nature. CDIO provides a systematic way to:

i. Conceive – Conduct market research and identify unique value propositions (Ries & Trout, 2001).
ii. Design – Develop branding, positioning, and promotional strategies (Aaker, 1996).
iii. Implement – Test marketing tactics through digital campaigns, guerrilla marketing, or crowdfunding (Hollensen, 2020).
iv. Operate – Use analytics and feedback to refine the marketing approach (Chaffey & Ellis-Chadwick, 2022).

The CDIO approach is praised for making marketing education more practical and industry relevant. By engaging students in product development, branding, and market testing, the curriculum closely mirrors real business challenges (Malmqvist et al., 2015). Malmqvist, Hugo, and Kjellberg (2015) conducted a global survey of 47 CDIO institutions in 2014 to explore implementation effects, including perceived benefits, barriers, and future development needs.

Creativity is an essential competency in the fields of marketing and innovation. According to Hassan and Othman (2020), marketing education should incorporate structured creativity training to ensure alignment with evolving industry demands. The integration of the CDIO (Conceive-Design-Implement-Operate) framework facilitates this by promoting iterative design thinking, reflective implementation processes, and user-centric product development strategies.

Further supporting this perspective, Tan and Sim (2023) examined the impact of CDIO-driven interdisciplinary collaborations between engineering and business students, revealing that such partnerships enhance creative outcomes in marketing. Their findings underscore the model's efficacy in fostering innovation by bridging disciplinary divides within academic settings. However, there is a significant research gap in the application of CDIO specifically in the development of creative marketing materials by TVET institution students. This study aims to fill the gap by focusing on the practical application of CDIO in the context of student innovation product promotion.

2. Methodology

This study adopted an action research design, integrating both qualitative and quantitative methods to comprehensively assess the effectiveness of the CDIO approach in developing creative marketing plans for student innovation products. The research employed a mixed-methods data collection strategy, utilizing structured questionnaires and systematic document analysis to evaluate student performance before and after the CDIO intervention.

A total of 42 students participated as respondents, selected through purposive sampling to ensure relevance to the study's objectives. The questionnaire was divided into two key sections:

a) Demographic Information – Capturing participants' academic background, prior experience in marketing, and familiarity with innovation-driven projects.
b) Evaluation of the CDIO Approach – Assessing students' perceptions of the framework's effectiveness in enhancing creativity, strategic thinking, and practical application in marketing.

In addition, a document review was conducted on students' marketing materials, including campaign proposals, branding strategies, and promotional content. A standardized evaluation form and rubric were applied to ensure consistency in assessing the quality, originality, and feasibility of the outputs.

3. Results and Discussion

Findings from the questionnaire showed that the majority of students had a good understanding of the CDIO concept and agreed that the approach helped improve creativity and effectiveness in producing marketing materials. Moreover, document reviews revealed quality improvements in aspects such as design, promotional messaging, and delivery strategy. Students demonstrated a higher capability in producing engaging, professional, and audience-appropriate marketing content.

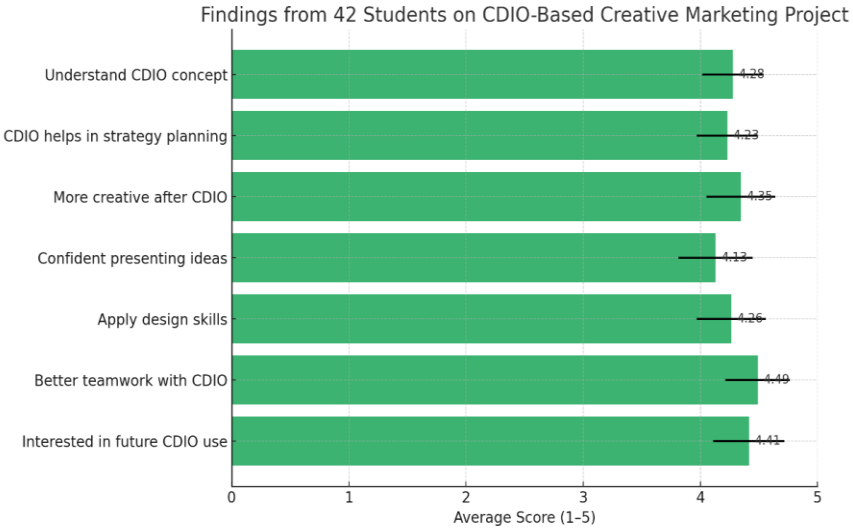

Fig. 1. CDIO-based creative marketing project

Table 1. Findings

No.	Statement	Mean Score	Standard Deviation
1	Understand CDIO concept	4.28	0.26
2	CDIO helps in strategy planning	4.23	0.26
3	More creative after CDIO	4.35	0.29
4	Confident presenting ideas	4.13	0.32
5	Apply design skills	4.26	0.29
6	Better teamwork with CDIO	4.49	0.28
7	Interested in future CDIO use	4.41	0.30

The highest mean score (4.49) was recorded for "Better teamwork with CDIO", indicating strong student agreement that CDIO promotes effective collaboration. Students also strongly agreed that CDIO increased their interest in future project-based learning (M = 4.41) and helped boost creativity (M = 4.35). The lowest score was still positive: "Confident presenting ideas" (M = 4.13), which may suggest a need for additional support in presentation or communication skills. All items scored above 4.1, reflecting consistently positive perceptions of CDIO in supporting learning and innovation in marketing education.

i. Understanding of the CDIO Concept
Students reported a strong grasp of the CDIO framework (Mean = 4.28, SD = 0.26), indicating that the conceptual foundation was effectively communicated through course instruction. This understanding is fundamental as it supports students in applying the

model to real-world marketing problems, aligning with findings from Malmqvist et al. (2015) on the pedagogical benefits of CDIO in higher education.

ii. Strategic Planning Skills
The statement *"CDIO helps in strategy planning"* recorded a mean score of 4.23. This suggests that students were able to utilize the structured phases of CDIO to better organize their marketing strategies—from idea conception to campaign execution. The low standard deviation (0.26) further indicates consistency in this perception across the cohort.

iii. Enhancement of Creativity
A mean score of 4.35 was reported for *"More creative after CDIO"*, reflecting students' belief that the CDIO approach encouraged out-of-the-box thinking, particularly during the "Design" and "Implement" phases. This supports research by Ali & Zainal (2022), who found that the CDIO framework nurtures creativity in technical and marketing education.

iv. Presentation Confidence
Although slightly lower than other items, the mean score of 4.13 for *"Confident presenting ideas"* still reflects overall agreement. This suggests that while CDIO provides opportunities for public speaking and pitching (e.g., during the "Operate" phase), some students may still require further support or practice to boost their presentation confidence.

v. Application of Design Skills
With a mean of 4.26, the statement *"Apply design skills"* indicates that students felt capable of incorporating graphic design, branding, and multimedia elements into their projects. These skills were further observed in the document analysis, which highlighted improved visual quality and persuasive messaging in student marketing materials.

vi. Teamwork and Collaboration
The highest-rated item was *"Better teamwork with CDIO"* (Mean = 4.49, SD = 0.28), underscoring the effectiveness of CDIO in promoting collaborative learning. Through project-based work, students engaged in team-based decision-making, role allocation, and problem-solving—critical competencies in both marketing and engineering contexts.

vii. Future Interest in CDIO
Students expressed a strong interest in continuing with the CDIO approach in future courses (Mean = 4.41), indicating that they found it not only effective but also engaging. This sentiment supports the long-term sustainability and scalability of CDIO-based curricula in applied education settings.

4. Conclusion

Based on the research findings, several recommendations are proposed:

i. The CDIO approach should be fully integrated into the marketing curriculum in polytechnics.
ii. Workshops or specialized training on creative marketing material design should be organized regularly.
iii. Ongoing assessment of student outputs using a CDIO rubric can help lecturers monitor students' development and achievements more systematically.

In conclusion, the CDIO approach has proven to have a positive impact on the development of creative marketing materials by students. It not only enhances students' creativity and technical competence but also strengthens critical thinking, teamwork, and practical problem-solving skills. This study supports the adoption of CDIO as a relevant and effective teaching approach in current TVET education.

Abstrak

Kajian ini bertujuan untuk mengenalpasti hubungan antara penyertaan Bengkel penasihatan matematik dan motivasi pelajar terhadap pencapaian dalam kursus Matematik Kejuruteraan 1 di kalangan pelajar lepasan Kolej Komuniti di Politeknik Tuanku Sultanah Bahiyah (PTSB). Kajian ini melibatkan 63 orang pelajar dari sesi I dan II Tahun Akademik 2024/2025. Pendekatan kuantitatif digunakan dengan instrumen soal selidik sebagai alat pengumpulan data. Data dianalisis menggunakan aplikasi *SPSS for windows* versi 27 bagi statistik deskriptif dan inferensi iaitu analisis Korelasi Pearson. Hasil analisis menunjukkan bahawa tahap penyertaan pelajar dalam Bengkel penasihatan matematik adalah pada tahap yang baik iaitu sebanyak 50.8%. Hanya segelintir pelajar sahaja mempunyai kehadiran yang rendah iaitu sebanyak 4.8%. Terdapat hubungan positif yang lemah di antara kehadiran Bengkel penasihatan matematik dan pencapaian dalam Matematik Kejuruteraan 1 dengan nilai korelasi, r=0.226, namun hubungan ini tidak signifikan secara statistik, p=0.075 . Sementara itu, terdapat hubungan negatif yang sangat lemah di antara faktor motivasi dan pencapaian pelajar, dengan nilai korelasi r=-0.182, p=0.273. Hubungan ini juga tidak signifikan secara statistik. Kajian ini diharap dapat memberikan gambaran yang lebih jelas tentang keberkesanan program sokongan seperti Bengkel penasihatan matematik dalam meningkatkan motivasi dan pencapaian pelajar. Hasil kajian ini juga akan menjadi rujukan penting untuk pensyarah dan pihak pengurusan dalam merangka strategi pengajaran yang lebih berfokus kepada keperluan pelajar lepasan Kolej Komuniti yang melanjutkan pelajaran di politeknik.

Kata kunci: Bengkel penasihatan matematik; Motivasi; Pencapaian.

1. Pengenalan

Matematik merupakan salah satu kursus teras yang wajib diambil oleh pelajar bidang kejuruteraan di politeknik Malaysia. Syarat kemasukan ke program kejuruteraan telah menetapkan keperluan memperoleh sekurang-kurangnya tiga kepujian dalam peperiksaan Sijil Pelajaran Malaysia (SPM), termasuk mata pelajaran Matematik. Menurut Er Xiao Hui dan Roslinda (2021), individu yang pintar matematik diperlukan dalam menghadapi perkembangan teknologi dan persaingan dunia pendidikan serta pekerjaan. Oleh kerana Politeknik menyediakan pelbagai program teknikal, pelajar TVET seharusnya memiliki asas matematik yang kukuh. Ini kerana keperluan penguasaan terhadap asas matematik adalah penting bagi kursus teknikal yang sebahagiannya terdiri daripada konsep pengiraan. Mohd Zulfabli dan Siti Salwa (2014) dalam kajiannya telah menyatakan pencapaian cemerlang dalam Matematik di peringkat SPM mempunyai hubungan dengan kebolehan pelajar menguasai kursus kejuruteraan di politeknik.

Kursus Matematik Kejuruteraan 1 merupakan kursus teras bagi semua pelajar semester pertama dalam program Diploma Kejuruteraan. Kursus ini adalah prasyarat kepada Matematik Kejuruteraan 2. Kandungan kursus ini terdiri daripada lima topik utama iaitu Asas Algebra, Trigonometri, Nombor Kompleks, Matriks serta Vektor dan Skalar. Topik-topik ini merangkumi silibus Matematik di peringkat sekolah menengah. Oleh itu, prestasi pelajar dalam Matematik semasa peringkat SPM memberi kesan langsung terhadap pencapaian mereka dalam kursus ini.

Bagi memperluas akses pendidikan teknikal dan vokasional (TVET), Kementerian Pendidikan Tinggi telah memperkenalkan pengajian di peringkat sijil di Kolej Komuniti iaitu sebagai laluan alternatif kepada pelajar lepasan SPM yang tidak memenuhi syarat kelayakan ke program diploma di politeknik. Program ini dijalankan secara sepenuh masa selama dua tahun, merangkumi 25% pembelajaran teori dan 75% latihan amali, selari dengan misi Kolej Komuniti sebagai 'Peneraju Komuniti Berilmu dan Berkemahiran' (JPPKK, 2013). Namun begitu, syarat kemasukan yang sangat rendah iaitu lulus Bahasa Melayu dan Sejarah, mengakibatkan ramai pelajar lemah subjek matematik turut diterima masuk ke Kolej Komuniti.

Kesannya, apabila pelajar lepasan Kolej Komuniti ini melanjutkan pengajian ke politeknik, bermula dengan kursus Matematik Kejuruteraan 1 pada semester pertama. Pelajar akan menghadapi kesukaran untuk mengikuti pengajaran akibat daripada asas matematik yang sangat lemah. Berdasarkan pemerhatian pensyarah di Jabatan Matematik, Sains dan Komputer (JMSK), Politeknik Tuanku Sultanah Bahiyah (PTSB), kursus Matematik Kejuruteraan 1 sering dianggap sukar dan mencabar oleh pelajar, terutamanya yang mempunyai keputusan matematik yang rendah semasa di peringkat sekolah menengah. Isu ini bukan sahaja mengganggu proses pengajaran dan pembelajaran, malah turut menjejaskan motivasi pelajar berkenaan. Tempoh pengajaran yang ditetapkan bagi sesuatu topik juga perlu dipanjangkan bagi kelas yang mempunyai bilangan pelajar lemah yang tinggi.

Pelbagai inisiatif telah diperkenalkan untuk membantu pelajar meningkatkan pencapaian, termasuk mengadakan Bengkel Pengukuhan Peperiksaan Akhir, Bengkel Bijak Algebra dan Bengkel Skor Ujian. Namun begitu, kadar kegagalan bagi kursus DBM10013 masih di tahap membimbangkan. Statistik Penilaian Akhir Semester Sesi II: 2023/2024 di PTSB menunjukkan 16.5% pelajar gagal dalam kursus ini dan peratus kegagalan ini disumbangkan oleh pelajar lepasan Kolej Komuniti. Kegagalan ini bukan sahaja memberi kesan terhadap motivasi pelajar, malah menambah beban akademik pelajar kerana terpaksa mengulang kursus. Oleh itu, bagi meningkatkan pencapaian pelajar lepasan Kolej Komuniti terhadap kursus Matematik Kejuruteraan 1, pihak pengurusan telah memohon JMSK untuk melaksanakan program intervensi dengan mengadakan Bengkel penasihatan matematik. Bengkel ini memfokuskan kepada konsep algebra yang merupakan asas kepada matematik (Simposium PTSB, 2024). Bengkel ini dijalankan secara berkala pada setiap minggu dengan penglibatan pelajar lepasan Kolej Komuniti dan pensyarah sebagai fasilitator.

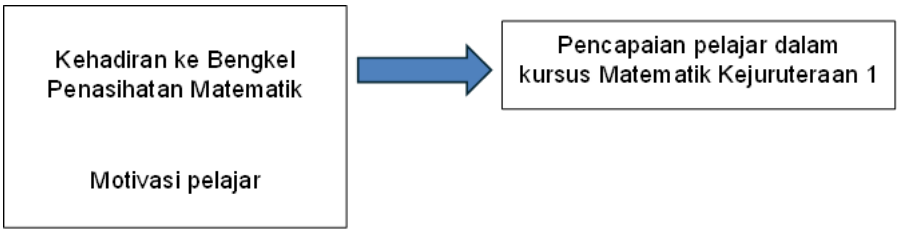
Justeru itu, kajian ini bertujuan mengenal pasti hubungan antara penyertaan Bengkel penasihatan matematik dan motivasi pelajar terhadap pencapaian dalam kursus Matematik Kejuruteraan 1 di kalangan pelajar lepasan Kolej Komuniti di Politeknik Tuanku Sultanah Bahiyah (PTSB). Objektif kajian ini adalah untuk mengenal pasti tahap penyertaan pelajar dalam Bengkel penasihatan matematik, mengenalpasti hubungan antara penyertaan Bengkel penasihatan matematik dengan pencapaian Matematik Kejuruteraan 1 dan mengenalpasti hubungan antara faktor motivasi dengan pencapaian Matematik Kejuruteraan 1. Fokus kajian adalah pada kehadiran pelajar ke bengkel yang disediakan dan motivasi kumpulan pelajar ini. Berdasarkan objektif kajian yang telah dinyatakan, kajian ini mencadangkan dua hipotesis iaitu yang pertama, wujudnya hubungan yang signifikan antara penyertaan bengkel dengan pencapaian Matematik Kejuruteraan 1. Hipotesis kedua pula sama ada terdapat hubungan yang signifikan antara faktor motivasi pelajar dengan pencapaian Matematik Kejuruteraan 1.

Kajian terdahulu menunjukkan bahawa tindakan pencegahan seperti bengkel pengukuhan atau kelas bimbingan mampu memberi impak positif terhadap pemahaman dan pencapaian pelajar dalam subjek Matematik, terutamanya dalam kalangan pelajar yang lemah. Kajian oleh Mohamad Nor dan Ruzlina (2020), mendapati bahawa pelajar yang menyertai bengkel pengayaan matematik menunjukkan peningkatan prestasi yang ketara berbanding pelajar yang tidak menyertainya. Dapatan Melati dan Nor Fadzlina (2022), menunjukkan terdapat hubungan yang positif bagi pencapaian pelajar dalam Peperiksaan Akhir setelah menghadiri

Bengkel Pengukuhan Matematik. Ini menunjukkan bahawa kehadiran ke Bengkel Pengukuhan Matematik membantu pelajar meningkatkan pencapaian mereka.

Selain itu, pencapaian akademik turut dipengaruhi oleh faktor motivasi. Kamus Dewan Edisi Keempat, mentakrifkan motivasi sebagai kehendak yang keras atau semangat yang kuat pada diri seseorang. Semangat ini akan mendorong seseorang itu untuk berusaha atau melakukan sesuatu untuk mencapai kejayaan. Motivasi menurut kajian ini terbahagi kepada dua jenis kategori iaitu motivasi dalaman dan motivasi luaran. Noraini (2005), menyatakan pelajar yang cemerlang dalam Matematik biasanya digerakkan oleh motivasi dalaman sementara motivasi luaran berkait rapat dengan konsep pengukuhan. Ini merujuk kepada sokongan moral dari luar seperti ibubapa, guru dan rakan sebaya. Manakala, Ainul Mardhiah dan Kamarulzaman (2018) pula menegaskan bahawa motivasi dalaman seperti minat, kepercayaan diri dan sikap positif terhadap subjek matematik memainkan peranan penting dalam menentukan tahap pencapaian pelajar. Dapatan oleh Wan Nazliza dan Siti Mistima (2020) menunjukkan bahawa tahap motivasi terhadap matematik mempengaruhi tahap pencapaian matematik murid secara sederhana. Norlia et al. (2006) yang menggunakan Model Inventori Pembelajaran di Sekolah oleh Selmes, mendapati pencapaian Matematik Tambahan berkait dengan gaya pembelajaran mendalam, usaha gigih, dan pendekatan terancang. Terdapat hubungan signifikan antara gaya pembelajaran mendalam dan motivasi dalaman. Namun, tiada perbezaan signifikan dari segi jantina, etnik, dan pencapaian awal. Secara keseluruhan, motivasi dikenal pasti sebagai faktor penting dalam pemilihan gaya pembelajaran pelajar.

Oleh itu, dengan menggabungkan penyertaan bengkel dan faktor motivasi, kajian ini berharap dapat memberikan gambaran yang lebih menyeluruh tentang faktor-faktor yang menyumbang kepada kejayaan pelajar dalam kursus Matematik Kejuruteraan 1, khususnya dalam kalangan pelajar lepasan Kolej Komuniti di politeknik seperti kerangka teori yang dibangunkan dalam Rajah 1.



Rajah 1. Kerangka teori kajian

2. Metodologi

Bab ini membincangkan sampel kajian, instrumen kajian dan kajian rintis yang dijalankan. Sampel kajian terdiri daripada 63 orang pelajar lepasan Kolej Komuniti yang melanjutkan pelajaran di peringkat diploma di Politeknik Tuanku Sultanah Bahiyah bagi sesi I dan II Tahun Akademik 2024/2025. Pelajar-pelajar ini terdiri daripada pelajar semester 1 di Jabatan Kejuruteraan iaitu Jabatan Kejuruteraan Awam, Jabatan Kejuruteraan Elektrik dan Jabatan Kejuruteraan Mekanikal yang mengambil kursus Matematik Kejuruteraan 1. Kajian ini berbentuk kuantitatif dengan instrumen soal selidik sebagai alat pengumpulan data. Soal selidik tersebut dibahagikan kepada dua (2) bahagian iaitu bahagian demografi dan faktor motivasi. Soal selidik yang dibangunkan adalah adaptasi daripada Inventori Pembelajaran di Sekolah oleh Selmes, dalam Norlia et al, (2006). Soalan soal selidik yang digunakan diubahsuai mengikut kesesuaian bagi mencapai objektif kajian. Soalan faktor motivasi mengandungi lapan (8) soalan yang terdiri daripada motivasi dalaman dan luaran. Manakala bagi pencapaian akademik, pembolehubah yang digunakan ialah nilai mata berdasarkan gred.

Jadual 1. Nilai mata dan gred

Markah	Nilai mata	Gred	Markah	Nilai mata	Gred
90 - 100	4.00	A+	50 - 54	2.00	C
80 - 89	4.00	A	47 - 49	1.67	C-
75 - 79	3.67	A-	44 - 46	1.33	D+
70 - 74	3.33	B+	40 - 43	1.00	D
65 - 69	3.00	B	30 - 39	0.67	E
60 - 64	2.67	B-	20 - 29	0.33	E-
55 - 59	2.33	C+	0 - 19	0.00	F

Sumber : Arahan Peperiksaan dan Kaedah Penilaian Politeknik dan Kolej Komuniti (2025).

Skala likert 5 nilai skor digunakan dalam soal selidik bagi kajian ini pada faktor motivasi. Nilai skor bagi skala likert adalah seperti berikut:

Jadual 2. Skala likert

Peringkat	Skor
Sangat tidak setuju	1
Tidak setuju	2
Tidak pasti	3
Setuju	4
Sangat setuju	5

Data yang diperoleh telah dianalisis menggunakan SPSS. Nilai min yang diperolehi bagi setiap faktor akan ditafsirkan mengikut skala yang ditetapkan seperti berikut:

Jadual 3. Tahap julat skor min

Skor Min	Tahap
Kurang 2.33	Rendah
2.33 hingga 3.67	Sederhana
Lebih 3.67	Tinggi

Soal selidik ini telah diuji kesahan dan kebolehpercayaannya melalui kajian rintis. Seramai 14 orang pelajar telah terlibat dengan kajian rintis ini. Nilai kebolehpercayaan diukur menggunakan nilai pekali Alpha Cronbach dengan menggunakan perisian SPSS. Mohd Najib (1999), menyatakan bahawa Alpha Cronbach merupakan pekali kebolehpercayaan yang menunjukkan item-item kajian berhubung antara satu sama lain. Sekiranya nilai Alpha Cronbach tersebut menghampiri 1, maka kebolehpercayaannya adalah tinggi, baik dan berkesan. Nilai di antara 0.6 dan 0.7 pula bermaksud nilai tersebut boleh diterima. Manakala nilai yang melebihi 0.8 bermaksud sangat baik. Berikut adalah cronbach alpha bagi setiap soalan:

Jadual 4. Cronbach alpha

Item	N	Cronbach alpha
Motivasi	8	0.803

Data dianalisis menggunakan aplikasi *SPSS for windows* versi 27 bagi statistik deskriptif dan inferensi iaitu analisis korelasi Pearson. Analisis korelasi Pearson digunakan bagi menentukan hubungan di antara dua pemboleh ubah. Pekali korelasi Pearson, *r* dapat menentukan kekuatan hubungan dan arah hubungan linear antara 2 pembolehubah. Julat nilai *r* adalah di antara -1 hingga +1. Jadual 1 menunjukkan skala kekuatan hubungan oleh Cohen et al (2011). Dalam kajian ini, korelasi Pearson digunakan untuk menentukan samada

terdapat hubungan yang signifikan antara kehadiran terhadap Bengkel penasihatan matematik dengan pencapaian pelajar dalam kursus Matematik Kejuruteraan 1 dan faktor motivasi dengan pencapaian pelajar dalam kursus Matematik Kejuruteraan 1.

Jadual 5. Aras kekuatan hubungan mengikut nilai pekali korelasi

Pekali Korelasi (r)	Kekuatan korelasi
±.81 hingga 1.00	Sangat kuat
±.51 hingga .80	Kuat
±.31 hingga .50	Sederhana
±.21 hingga .30	Lemah
±.01 hingga .20	Sangat lemah

3. Dapatan dan Perbincangan

Bahagian ini membincangkan latar belakang responden yang terlibat, merangkumi aspek jantina, program pengajian serta pencapaian dalam subjek Matematik Kejuruteraan 1. Seramai 63 orang pelajar telah terlibat sebagai responden dalam kajian ini.
Jadual 6 menunjukkan bahawa majoriti responden terdiri daripada pelajar lelaki, iaitu seramai 55 orang atau 87.3%, manakala pelajar perempuan hanya seramai 8 orang atau 12.7%. Ini menunjukkan bahawa terdapat ketidakseimbangan dari segi agihan jantina dalam kalangan responden yang merupakan ambilan pelajar lepasan Kolej Komuniti, dengan pelajar lelaki mendominasi kajian ini. Responden kajian terdiri daripada pelajar pelbagai program pengajian di peringkat diploma di PTSB. Program yang mempunyai bilangan responden yang tertinggi ialah Diploma Kejuruteraan Elektrik (DET), dengan responden seramai 31 orang atau 49.2%. Manakala, program Diploma Kejuruteraan Awam (DKA) dan Diploma Kejuruteraan Mekanikal (DKM) masing-masing mencatatkan seramai 10 orang responden atau 15.9%. Program-program lain seperti Diploma Kejuruteraan Mekanikal (Pembuatan) (DTP) dan Diploma Kejuruteraan Elektrik Elektronik (DEE) mencatatkan 4 orang responden (6.3%), manakala program Diploma Kejuruteraan Elektrik (Komputer) (DTK) mempunyai 2 orang responden (3.2%) dan program Diploma Geomatik (DGU) serta Diploma Kejuruteraan Elektrik (Perhubungan) (DEP) masing-masing hanya mempunyai seorang responden (1.6%).

Jadual 6. Latar belakang responden

Item		N	%
Jantina	Lelaki	55	87.3
	Perempuan	8	12.7
Program	DKA	10	15.9
	DGU	1	1.6
	DET	31	49.2
	DEP	1	1.6
	DTK	2	3.2
	DEE	4	6.3
	DKM	10	15.9
	DTP	4	6.3
Pencapaian mengikut gred	A- hingga A+	5	7.9
	B- hingga B+	14	22.2
	C+ hingga C-	27	42.9
	D hingga D+	7	11.1
	E dan ke bawah	10	15.9

Seterusnya, dari segi pencapaian akademik dalam subjek Matematik Kejuruteraan 1, didapati bahawa majoriti responden memperoleh gred pada tahap sederhana iaitu C+ hingga C, iaitu seramai 27 orang atau 42.9%. Seramai 14 orang responden pula (22.2%) memperoleh gred B- hingga B+. Manakala 10 orang responden (15.9%) memperoleh gred E dan ke bawah. Seramai 7 orang responden (11.1%) memperoleh gred D hingga D+, dan hanya 5 orang responden (7.9%) yang mencapai gred cemerlang iaitu A- hingga A+. Dapatan ini menunjukkan bahawa majoriti daripada pelajar berada pada tahap pencapaian sederhana, dengan hanya sebilangan kecil sahaja yang memperoleh keputusan cemerlang.

Jadual 7. Kehadiran pelajar ke Bengkel penasihatan matematik

	Item	N	%
Kehadiran pelajar dalam Bengkel penasihatan matematik	80 % hingga 100%	32	50.8
	60% hingga 79%	10	15.9
	40% hingga 59%	11	17.5
	20 % hingga 39%	7	11.1
	Bawah 19%	3	4.8

Jadual 7 menunjukkan kehadiran pelajar dalam Bengkel penasihatan matematik Kejuruteraan 1. Data menunjukkan bahawa sebahagian besar responden mempunyai tahap penyertaan yang tinggi. Seramai 32 orang pelajar (50.8%) mencatatkan kehadiran di antara 80% hingga 100%. Ini menunjukkan bahawa pelajar sedar akan kepentingan Bengkel penasihatan matematik yang dijalankan dengan memberikan komitmen yang baik. Namun begitu, seramai 11 orang pelajar (17.5%) hadir pada tahap 40% hingga 59%, dan 10 orang (15.9%) hadir pada tahap 60% hingga 79%. Terdapat juga pelajar yang hadir kurang daripada 19% iaitu seramai 3 orang (4.8%). Ini menunjukkan, wujudnya jurang penyertaan yang ketara dalam kalangan pelajar yang mungkin dipengaruhi oleh faktor-faktor lain seperti motivasi, terlibat dengan program politeknik, urusan peribadi, atau kekangan lain. Dapatan ini selari dengan kajian oleh Mustafa dan Mohd Rashid (2021), iaitu pelajar yang hadir secara konsisten dalam sesi bimbingan lebih cenderung untuk menunjukkan peningkatan prestasi dalam subjek Matematik. Tambahan pula, Norazila dan Halim (2019) menegaskan bahawa tahap kehadiran yang rendah sering dikaitkan dengan kurangnya keyakinan dan motivasi pelajar terhadap subjek yang diambil. Dalam konteks kajian ini, penglibatan yang rendah dalam bengkel mungkin menjadi antara faktor penyumbang kepada pencapaian yang kurang memuaskan. Kenyataan ini dibuktikan dalam latar belakang responden yang memperoleh gred rendah. Oleh itu, adalah penting untuk merangka strategi yang lebih berkesan untuk meningkatkan kehadiran, termasuk pendekatan pembelajaran yang lebih menarik, fleksibel serta berpusatkan pelajar.

Jadual 8. Hubungan antara kehadiran ke Bengkel penasihatan matematik dengan pencapaian

		Kehadiran	Pencapaian
Kehadiran	Pearson Correlation	1	0.226
	Sig. (2-tailed)		0.075
Pencapaian	Pearson Correlation	0.226	1
	Sig. (2-tailed)	0.075	

Analisis korelasi Pearson dijalankan bagi menentukan hubungan antara kehadiran ke Bengkel penasihatan matematik dengan pencapaian pelajar. Jadual 8 menunjukkan bahawa terdapat hubungan positif yang lemah antara kehadiran Bengkel penasihatan matematik dan pencapaian dalam Matematik Kejuruteraan 1 dengan nilai $r(63) = .23$. Namun, hubungan ini tidak signifikan secara statistik, dengan $p = .075$. Ini menunjukkan bahawa peningkatan kehadiran pelajar ke bengkel tidak berkait secara langsung dengan peningkatan pencapaian

akademik. Penemuan ini sejajar dengan kajian Crede et al (2010) yang mendapati kehadiran semata-mata tidak menjamin peningkatan pencapaian akademik sekiranya tiada motivasi dalaman dan penglibatan aktif daripada pelajar. Aspek kehadiran yang dilihat tidak memberikan impak yang signifikan terhadap pencapaian turut berkait dengan kenyataan Faizi dan Alvi (2023) bahawa walaupun kehadiran penting sebagai indikator komitmen pelajar, ia bukan satu-satunya faktor yang mempengaruhi pencapaian pelajar.
Berdasarkan kajian-kajian lepas, dapat disimpulkan bahawa kehadiran ke Bengkel penasihatan matematik semata-mata tidak mencukupi untuk menjamin peningkatan prestasi akademik. Ini kerana peningkatan pencapaian pelajar perlu juga mengambil kira faktor-faktor lain seperti keberkesanan penyampaian, penglibatan pelajar dalam aktiviti pengajaran dan pembelajaran, faktor sikap, dan motivasi pelajar itu sendiri. Pelajar juga perlu diberi galakan dan dorongan bagi memastikan mereka turut serta secara aktif dalam program yang dirancang. Penambahbaikan dari segi pelaksanaan bengkel dan kaedah pemantauan juga menjadi penyumbang kepada peningkatan pencapaian pelajar dalam Matematik Kejuruteraan 1.

Jadual 9. Hubungan antara faktor motivasi dan pencapaian

		Pencapaian	Motivasi
Pencapaian	Pearson Correlation	1	-0.182
	Sig. (2-tailed)		0.273
Motivasi	Pearson Correlation	-0.182	1

Dapatan analisis pada Jadual 9 menunjukkan bahawa terdapat hubungan negatif yang sangat lemah di antara motivasi dan pencapaian pelajar, dengan nilai korelasi Pearson r = -0.182. Selari dengan dapatan Saemah dan John (2006), faktor motivasi mempunyai hubungan langsung negatif yang ke atas pencapaian akademik. Namun begitu, hubungan ini tidak signifikan secara statistik kerana nilai p adalah lebih besar daripada aras signifikan 0.05 (p = 0.273). Ini menunjukkan bahawa motivasi pelajar dalam konteks kajian ini tidak mempunyai hubungan yang bermakna secara statistik terhadap pencapaian mereka dalam subjek tersebut. Dapatan ini mungkin disebabkan oleh faktor lain yang lebih dominan mempengaruhi pencapaian pelajar seperti kebolehan asas matematik, teknik pengajaran, atau kehadiran ke kelas.

Hasil analisis ini disokong oleh kajian lepas yang dijalankan oleh pengkaji terhadap pelajar yang mengulang kursus Matematik Kejuruteraan 2, dapatan menunjukkan tiada hubungan di antara motivasi dan pencapaian pelajar (Masniza dan Maziah, 2019). Namun demikian, sebaliknya hasil dapatan menunjukkan terdapat hubungan antara motivasi dalaman dan luaran adalah signifikan *(p = 0.871, t=0.000*). Ini menunjukkan bahawa motivasi dalaman akan mendorong motivasi luaran pelajar dalam memastikan lulus dalam peperiksaan. Norlia et al (2006) berpendapat bahawa faktor motivasi memainkan peranan penting dalam menentukan pemilihan gaya pembelajaran yang diamalkan oleh pelajar seterusnya secara tidak langsung dapat meningkatkan pencapaian mereka. Manakala, penemuan ini berbeza dengan kajian oleh Faizi dan Alvi (2023), yang menunjukkan motivasi mempunyai peranan penting dalam menentukan pencapaian akademik pelajar.

4. Kesimpulan

Secara keseluruhannya, dapatlah disimpulkan bahawa kehadiran pelajar ke Bengkel penasihatan matematik adalah pada tahap yang baik. Hanya segelintir sahaja pelajar mempunyai kehadiran yang rendah. Kehadiran pelajar yang rendah dalam Bengkel penasihatan matematik mungkin menjadi faktor penyumbang kepada pencapaian yang kurang memuaskan. Analisis Korelasi Pearson dijalankan bagi menentukan hubungan antara

kehadiran ke Bengkel penasihatan matematik dengan pencapaian pelajar. Terdapat hubungan positif yang lemah di antara kehadiran Bengkel penasihatan matematik dan pencapaian dalam Matematik Kejuruteraan 1, namun hubungan ini tidak signifikan secara statistik. Manakala, terdapat hubungan negatif yang lemah di antara faktor motivasi dan pencapaian pelajar. Hubungan ini juga tidak signifikan secara statistik. Walaupun dapatan ini menunjukkan keputusan yang sebaliknya, tetapi Bengkel penasihatan matematik masih relevan untuk diteruskan.

Diharapkan maklumat ini dapat menjadi rujukan pensyarah untuk memperkasakan program intervensi bagi pelajar lepasan Kolej Komuniti. Selain itu, pengkaji mengemukakan beberapa cadangan untuk kajian di masa hadapan. Faktor motivasi yang dikaji perlu lebih menyeluruh dengan bilangan sampel yang lebih besar daripada beberapa politeknik di Malaysia. Selain itu, disarankan agar kajian lanjutan menggunakan pendekatan kualitatif seperti temubual untuk memahami dengan lebih mendalam jenis motivasi yang mendorong pelajar serta cabaran yang mereka hadapi dalam subjek Matematik Kejuruteraan 1.

RELATIONSHIP BETWEEN TEST AND FINAL EXAM ASSESSMENT FOR ENGINEERING MATHEMATICS COURSE: A CASE STUDY

Hasliza Halim*, Faridah Hj. Ismail

Mathematics, Science, and Computer Department, Politeknik Tuanku Sultanah Bahiyah, 09000 Kulim, Kedah, Malaysia

*Corresponding author e-mail address: hasliza_halim@ptsb.edu.my

Abstract

This study involves all Engineering Mathematics courses offered by the Department of Mathematics, Science, and Computing at Politeknik Tuanku Sultanah Bahiyah. The respondents who participated in this study were 349 from the course DBM10013, 340 from DBM20023, 120 from DBM30033, and 150 from DBM30043. The aims are to explore students' perceptions and to identify the relationship between test scores and final examination scores. The study utilizes the Pearson correlation coefficient and a two-tailed hypothesis test. The research instruments used were questionnaires, tests, and final examination papers. Findings from the questionnaire revealed that between 50% and 70% of students were uncertain about their ability to perform well in the final examination if their test scores were poor. The analysis results showed that the correlation coefficients for all courses exceeded 0.5. The scatter plot graphs also indicated a positive correlation, where an increase in one variable corresponded with an increase in the other. In addition, the p-value obtained (< .001) from the two-tailed hypothesis test supports the hypothesis that test scores can serve as early indicators of students' academic performance. This can assist lecturers in planning appropriate interventions before the final examinations. The large sample size also contributes to the reliability of the study's findings. Overall, the results of this study are expected to serve as a guide for lecturers in identifying students who require early assistance and in focusing on topics that need greater emphasis in preparation for the final examination.
Keywords: Correlation; Test; Final exam.

1. Introduction

One of the core subjects in the Malaysian education system is Mathematics, and it is an important field of knowledge not only in schools but also at institutional levels such as polytechnics and universities. Mathematics is defined as the study of numbers and diagrams where the study or learning revolves around structural patterns, quantities, changes, and spaces (Ahmad Shahrulazahar, 2011). Mathematics is seen as a simple extension of writing and conversational language with very clear grammar and vocabulary to delve into and explain conceptual and physical relationships.

Since the quality of education is closely related to the curriculum of the course being conducted, this is where the role of the curriculum evaluator lies in ensuring that the curriculum being conducted complies with the quality and meets the objectives that have been set. Overall, assessment in education plays an important role in ensuring that the teaching and learning process in the classroom runs smoothly and effectively. Without an assessment carried out by educators, it is certain that the educators will not be able to detect students' weaknesses in the learning process. In technical education settings such as polytechnics, Engineering Mathematics is a foundational subject that demands both conceptual understanding and procedural fluency. Engineering Mathematics is a challenging course and is mandatory for all engineering students at polytechnics. There are four Engineering Mathematics courses offered, namely DBM10013 Engineering Mathematics 1, DBM20023

Engineering Mathematics 2, DBM30033 Engineering Mathematics 3 and DBM30043 Electrical Engineering Mathematics.

Each Engineering Mathematics course has individual assessments, namely tests and final exams. Tests are one of the assessment instruments to identify student achievement after studying certain topics in the syllabus, while the final exam is an assessment of the entire topic at the end of the semester. Thus, the relationship between test performance (as a form of CA) and final exam results is of particular interest to educators and policymakers seeking to enhance teaching effectiveness and student outcomes.

1.1 Continuous Assessment (CA) and Student Performance

Continuous assessment refers to regular, formative evaluations conducted throughout a course, including quizzes, assignments and tests. Studies have consistently demonstrated that the implementation of continuous assessment has proven to be effective in improving students' academic performance. CA fosters consistent engagement and allows students to receive timely feedback, thus improving their overall academic achievement. Finally, she concluded that there is a strong relationship between the continuous assessment method, the implementation of continuous assessment and its impact on students (Farhana Sabidin, 2002). A moderate positive correlation between the average continuous assessment score and students' class performance. Their findings suggest that when students are evaluated frequently, they are more likely to stay motivated and make consistent efforts to improve (Nurul Husna Hasan et al., 2017). Continuous assessment has a positive effect on student achievement. Lecturers who are skilled in assessment and evaluation techniques should use their expertise for the purpose of improving student performance at the primary level (Melati Sabtu et al., 2022; Mohammad Iqbal et al., 2017).

Assessment plays a significant role in modern education, particularly in evaluating the effectiveness of teaching and the progress of student learning. It serves various purposes, such as improving teaching strategies, guiding curriculum development and providing feedback to both educators and students (Nik Muhammad Anas, 2018; Jill Morrison, 2003). In the context of higher education, continuous assessment and final examinations are commonly used methods to measure student achievement and understanding of course content. In a recent study focusing on Engineering Mathematics, revealed a strong and statistically significant correlation ($r = 0.718$, $p < 0.01$) between CA and FE scores of students for the Engineering Mathematics 1 course at PSMZA..

The study concluded that students who perform well in assessments during the semester are more likely to succeed in final examinations (Ade et al., 2024). Assessment is a continuous process throughout a teacher's teaching session (Fatimah, 2000). Assessment means collecting information (Smith, 1997). Therefore, through assessment, information about knowledge, understanding, ability and attitude can be obtained (Morris, 1991). However, the extent to which this test assessment can predict student achievement in the final examination is still not discussed in depth.

1.2 Final Examination and Academic Achievement

Final examinations are summative assessments that provide a comprehensive evaluation of student learning at the end of a course. They test students' ability to synthesize and apply knowledge acquired throughout the semester (Azlin Norhaini, 2018).cThe impact of a Mathematics Reinforcement Workshop and observed a positive relationship between continuous assessment and final exam performance, indicating that supplementary academic interventions can enhance student outcomes in mathematics (Melati Sabtu et al., 2022). Meanwhile, emphasized the need for assessment-literate instructors who can align formative and summative evaluations to support student success (Mohammad Iqbal et al., 2017). In a

seminar review published in *Assessment in Education: Principles, Policy & Practice*, affirmed that formative assessment has one of the most significant positive impacts on student learning. Their work underlined the importance of frequent feedback and data-driven instruction, especially in technical subjects (Internationally, Black and Wiliam, 1998). A study among 552 pre-university engineering students in Malaysia, demonstrating that quizzes and open-book test scores are significant predictors of final mathematics exam performance, accounting for approximately 46.7% of the variance, adjusted $R^2 = 0.467$ (Bahrom and Hisham, 2024). Analyzed data from 250 pre-university students and found a strong positive correlation between diagnostic assessment scores and final mathematics exam outcomes, substantiating the use of scatterplot visualization and Pearson correlation in predictive analysis (Tan et al., 2017).

1.3 Motivation, Learning Style, and Confidence as Influencing Factors

A significant relationship between intrinsic motivation and extrinsic performance outcomes (p = 0.871, t=0.000), indicating that internally driven students tend to perform better in assessments. Academic success is multifaceted and can be influenced by psychological and behavioural factors. This shows that intrinsic motivation will drive students' extrinsic motivation in ensuring they pass the exam (Masniza et al., 2019). Kinesthetic learners tend to excel in Higher-Order Thinking Skills (HOTS) tasks when teaching methods align with their learning styles. These findings reinforce the importance of differentiated instruction in technical education. The results of Nurin Wajahah's study found that there is a significant relationship between kinesthetic learning styles and students' HOTS (Nurin Wajahah, 2017). The role of student self-confidence and discovered a strong positive correlation (r = 0.74) with academic achievement. Her study emphasized that confident students are more active in class, more resilient in facing challenges and generally perform better academically (Farahiyah, 2013).

2. Methodology

This study employs a quantitative approach, utilizing two research instruments. The first instrument is a questionnaire. This questionnaire was given to respondents after receiving their test scores to find out students' perceptions about test evaluations and final exams. Ethical approval was obtained from the institution, and participants were informed that their responses would be kept anonymous and confidential. The second instrument was data from test and final exam paper. A comparison of correlation coefficient values was done to see the actual relationship between test scores and final exam scores.

The study data was analyzed using SPSS version 27.0 software with the Pearson Correlation Coefficient method, two-tailed hypothesis. This two-tailed hypothesis was used because this study only wanted to find out if there was a significant relationship, without making any initial assumptions about the direction of the relationship.
H_0 (nul): There is no significant relationship between test scores and final exam scores.
H_1 (alternative): There is a significant relationship between test scores and final exams.
This analysis is used to determine the level of strength and correlation value between two sets of data and then assess the reliability of the test as a tool for predicting final exam achievement.

Data was taken from two sessions where for Session I: 2023/2024, the courses involved were DBM10013 Engineering Mathematics 1, DBM30033 Engineering Mathematics 3 and DBM30043 Electrical Engineering Mathematics. While for Session II: 2023/2024, the course involved was DBM20023 Engineering Mathematics 2. Respondents consisted of Civil Engineering (JKA) students, Electrical Engineering Department (JKE) students and Mechanical Engineering Department (JKM) students representing their respective courses. For JKM, respondents were taken from the Diploma in Mechatronics Engineering (DEM), Diploma in Mechanical Engineering (DKM) and Diploma in Manufacturing Mechanical

Engineering (DTP) programmes. For JKA, respondents were taken from the Diploma in Geomatics (DGU) and Diploma in Civil Engineering (DKA) programmes. For JKE, respondents were taken from the Diploma in Electrical and Electronics Engineering (DEE), Diploma in Electronic and Communication Engineering (DEP), Diploma in Electrical Engineering (DET) and Diploma in Computer Electronics Engineering (DTK) programmes.

This study employed a total population sampling approach, where the entire population of interest was included as the sample. Total population sampling was chosen due to the manageable size of the population and the need to obtain comprehensive and accurate data from all relevant participants. This method also ensures that the findings are representative of the whole group without the need for sampling estimation or generalization. The detailed findings of the number of respondents taken are as shown in Table 1 below, with a breakdown of 349 respondents for the DBM10013 course, 340 respondents for the DBM20023 course, 120 respondents for the DBM30033 course, and 150 respondents for the DBM30043 course.

Table 1. Number of respondents

	Session I:2023/2024						Session II:2023/2024	
	DBM10013		DBM30033		DBM30043		DBM20023	
JKM	DKM1A,B,C	70	DKM3A,B,C	60			DKM2A,B,C	70
	DTP1A	25	DTP3A	16			DTP2A	20
	DEM1A	19	DEM3A,B	44			DEM2A	18

	DEE1A,B	47			DEE3A,B	38	DEE2A,B	47
	DET1A,B,C	76			DET3A,B,C	65	DET2A,B,C	76
JKA	DKA1A,B	48					DKA2A,B	44
	DGU1A,B	25					DGU2A,B	26
	TOTAL	349	TOTAL	120	TOTAL	150	TOTAL	340

3. Results and Discussion

The first objective of this study is to determine students' perceptions of test and final exam evaluations. The findings of the first instrument are data from a questionnaire distributed to respondents. All data presented in this study were collected in accordance with ethical research standards. Respondents gave informed consent, and their anonymity and confidentiality were ensured throughout the data collection and analysis process. There are 5 question items asked to respondents and the findings are as shown in Table 2 below.

Table 2. Student perception questionnaire regarding test and final exam evaluation

	Item soalan	Percentage 'YES'			
		DBM10013	DBM30033	DBM30043	DBM20023
1.	Are you agree that the implementation of test assessments done individually?	86.0%	83.1%	93.1%	88.8%
2.	If my test scores are high, I'm sure my final exam scores will also be high.	75.7%	75.0%	73.3%	72.6%

3.	Good test scores boosted my confidence for the final exam.	97.1%	94.2%	90.0%	97.1%
4.	Even though my test scores are low, I am confident that I can still excel in the final exam.	51.4%	62.5%	66.7%	55.9%
5.	I believe that achievement in tests is closely related to achievement in the final exam.	86.0%	83.1%	93.1%	88.8%

The fact that over 80% of respondents in all courses agreed with the implementation of individual test assessments reflects strong support for individualized evaluation methods. This suggests that students value fair and personal assessment of their knowledge and abilities. It also indicates a high level of readiness among students to be accountable for their own performance, which aligns with the principles of outcome-based education (OBE). Although Item 2 recorded agreement percentages ranging from 70% to 76%, this only indicates a moderate level of confidence among students regarding the consistency between test scores and final exam results.

This may imply some uncertainty regarding their performance stability or perhaps concern about other influencing factors such as differences in test formats, exam pressure, or the perceived difficulty of final exams. Hence, students may not fully view test results as a direct predictor of final exam success. The respondents are not very confident that if their test scores are high, their final exam scores will also be high. Interestingly, Item 3 revealed that over 90% of students felt that good test performance increased their confidence for the final exam. While Item 2 showed that students were not fully convinced that test performance guaranteed final results, this finding highlights the motivational and psychological benefits of doing well in continuous assessments.

It suggests that formative assessments can play a crucial role in building students' self-efficacy and reducing exam anxiety, both of which are important for academic success. This supports Masniza & Maziah (2019) and Farahiyah (2013), who argue that psychological factors like motivation and self-confidence significantly affect academic outcomes. In essence, even if students are uncertain of a direct outcome, the psychological reinforcement from doing well in tests contributes to better performance. Only 50% to 70% of students believed they could still perform well in the final exam despite having low test scores for Item 4. This indicates a lack of confidence in their ability to recover or improve over time, suggesting that students may place significant weight on early test performance.

It also raises concerns about the level of academic resilience among students and whether they are equipped with the skills or mindset to improve through continued effort. The high percentage (above 80%) of agreement for Item 5 shows that most students believe there is a strong correlation between test performance and final exam results. This perception reinforces the idea that students view continuous assessment not only as a learning tool but also as a predictor of final outcomes. It supports findings from Items 1 and 3, highlighting students' recognition of the role of tests in shaping both their academic development and confidence. This also aligns with prior research emphasizing the value of formative assessments in promoting sustained learning and achievement.

Furthermore, the results align with the theoretical framework presented by Black and Wiliam (1998), who emphasized that formative assessments, when integrated purposefully, significantly enhance student learning and long-term retention. In this study, tests appear to serve not only as evaluative tools but also as learning checkpoints that prepare students for the cognitive demands of the final exam. The second objective is to identify whether there is a significant relationship between test and final exam evaluations. The third objective is to assess the reliability of tests as a predictive tool for final exam achievement.

Next, the findings of the second instrument are data from the test scores and final exam scores of the respondents. The correlation coefficient value studied is the relationship between the test scores and the overall final exam score. The correlation value is used to find the relationship between two or more variables whether they influence each other or not. The interpretation of the strength of correlation in this study is based on the interpretation of the strength of correlation from the Davies (1971) study as shown in Table 3.

Table 3. Interpretation of correlation strength

Mean score	Scale
0.70 – 1.00	Very High
0.50 – 0.69	High
0.30 – 0.49	Medium
0.10 – 0.29	Low
0.00 – 0.09	Ignore

Table 4 shows the details of the correlation coefficient analysis and interpretation for each course. The results of the correlation coefficient values show a VERY HIGH level of correlation for the DBM10013, DBM20023 and DBM30033 courses. Meanwhile, the correlation coefficient values show a HIGH level of correlation for the DBM30043 course. The correlation coefficient values exceeding 0.5 for all these courses indicate that there is a strong positive relationship between test scores and final examination scores. However, while the results are consistent and statistically significant within the Engineering Mathematics context, they may not be generalizable to other disciplines or institutions with different teaching methods, assessment formats, or student demographics.

akhirDBM30043	Pearson Correlation	.630**	1
	Sig. (2-tailed)	<.001	
	N	150	150

**. Correlation is significant at the 0.01 level (2-tailed).

Interpretation DBM30043

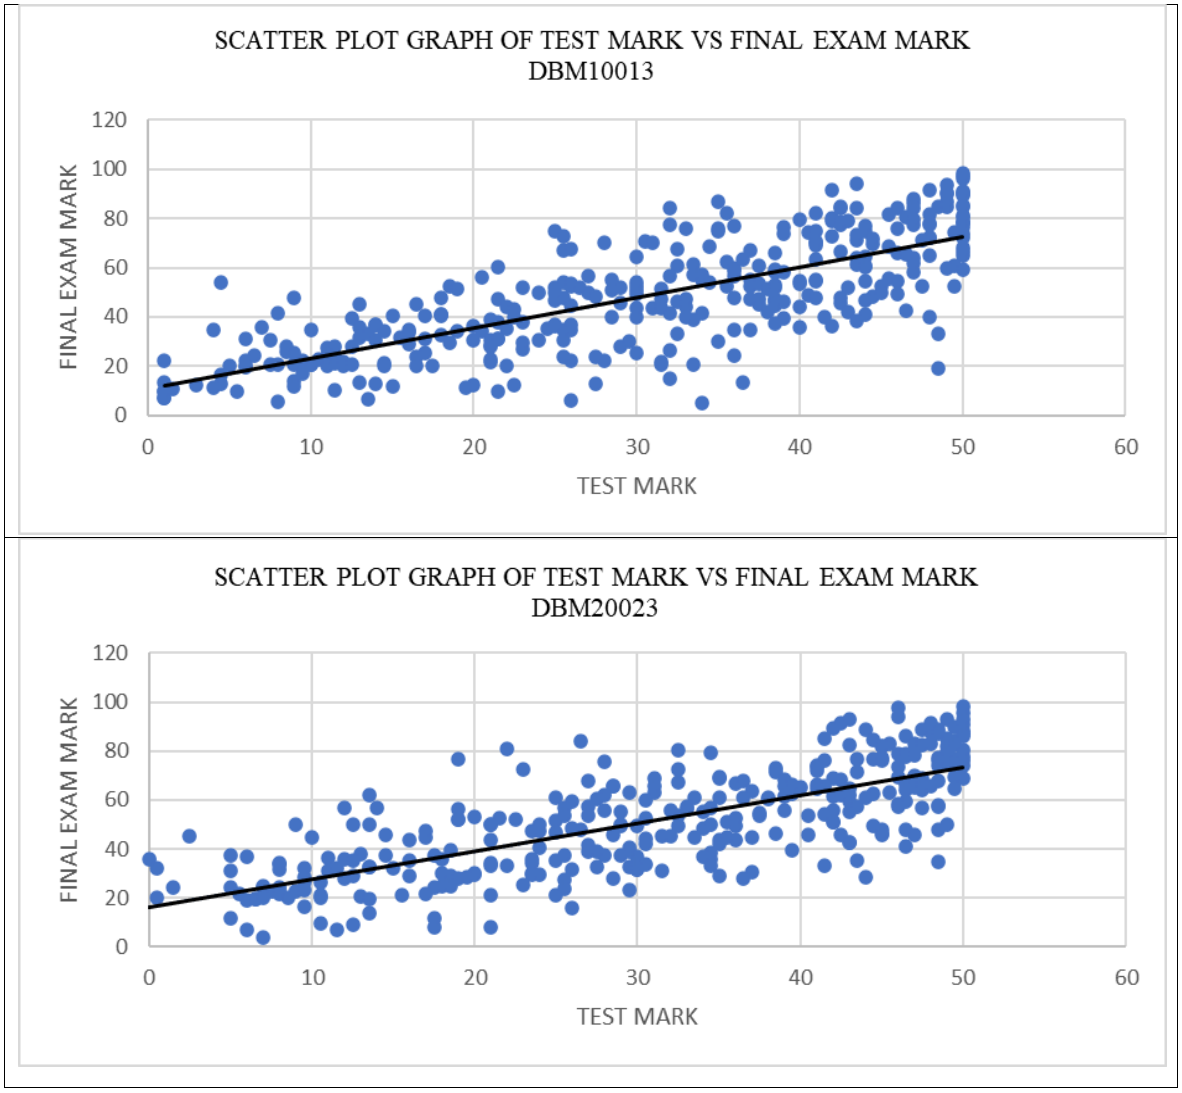
There is a HIGH and statistically significant positive relationship between student achievement in tests and final exams.
(r = 0.630, p < .001, *two-tailed*).

These findings clearly indicate a statistically significant and strong positive relationship between students' test scores and their final examination results across all Engineering Mathematics courses surveyed. The strength of correlation values, particularly those exceeding r = 0.74 for DBM10013, DBM20023 and DBM30033, suggest that formative assessments play a substantial role in predicting and potentially influencing summative performance. This is in line with the findings of Ade et al. (2024), who reported a similar very strong correlation in the Engineering Mathematics 1 course at PSMZA. The present study, however, expands on that evidence by including multiple courses and different levels (introductory and advanced) within the Engineering Mathematics curriculum, reinforcing the consistency of this relationship across course structures.

This result supports the hypothesis that tests can be used as an early indicator of student performance and can help lecturers to plan interventions ahead of the final exams. The large number of respondents also gave confidence in the reliability of these findings. The implication for educators is that test performance can be a reliable early indicator of final achievement.

Lecturers can use this information to identify at-risk students earlier and implement targeted remedial interventions before the final exam. Figure 1 presents a scatter plot illustrating the correlation between test scores and final examination results across all Engineering Mathematics courses. This scatter plot graph uses dots to represent the values of two different numerical variables. The position of each dot on the horizontal and vertical axes indicates the value for an individual data point. Each dot represents an individual student's performance, with the horizontal axis showing test scores and the vertical axis representing final exam scores.

This scatter plot graph is used to see the relationship between variables. When the dots in the graph increase, moving from left to right, then the scatter plot shows a positive correlation. The overall upward trend of the data points from left to right indicates a positive correlation. This means that the value of one variable is increasing in relation to the other. This shows the relationship of test scores to final exam scores. These findings clearly indicate a statistically significant and strong positive relationship between students' test scores and their final examination results. This suggests that students who perform well in tests are more likely to achieve higher scores in their final examinations, reinforcing the value of continuous assessment as a predictor of academic performance.



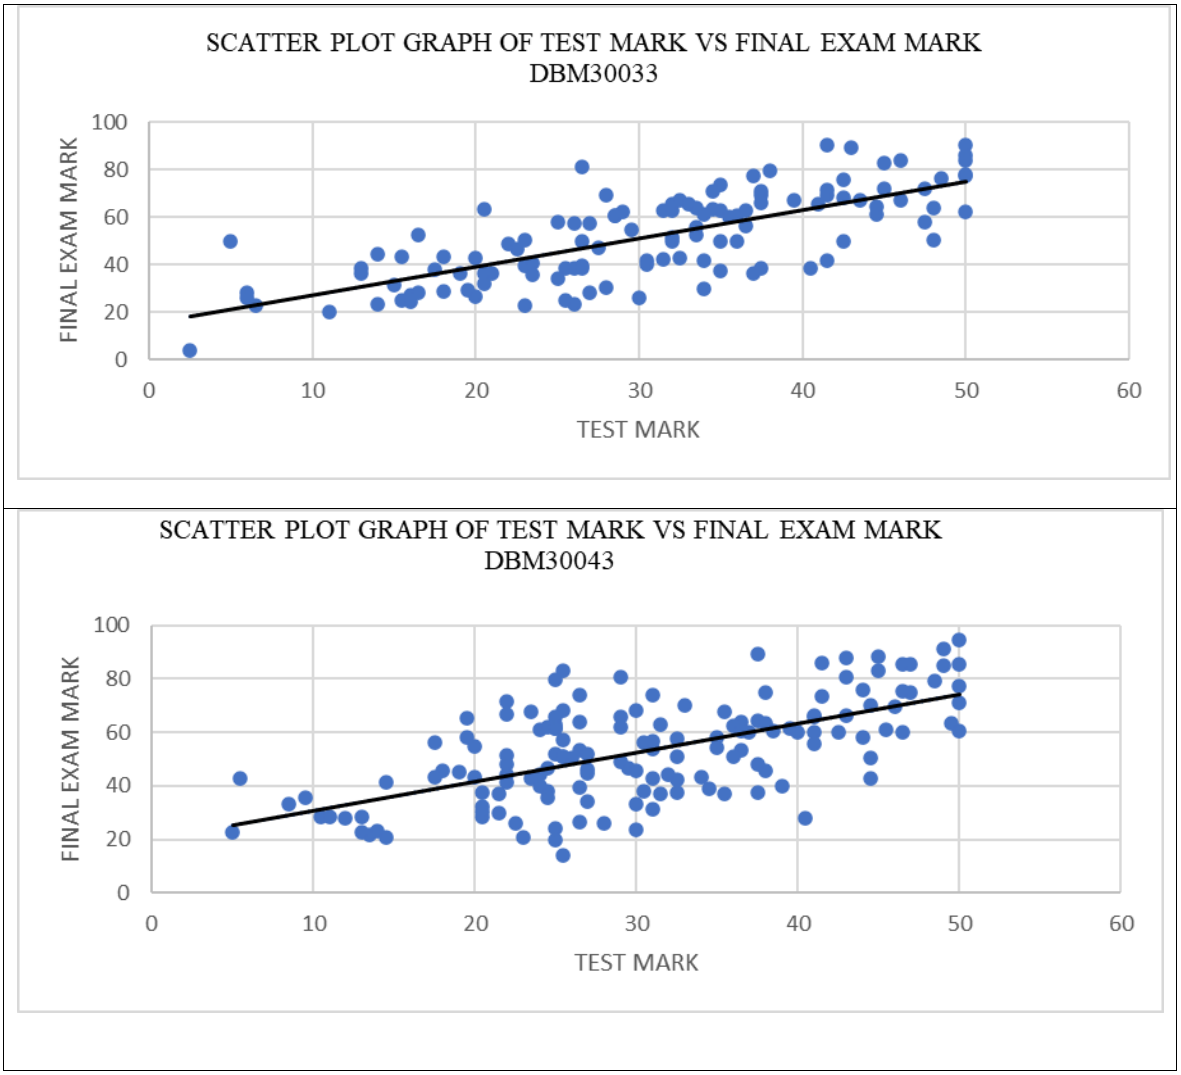


Fig. 1. Scatter plot graph of correlation coefficient values for each course

4. Conclusion

Overall, it can be concluded that there is a significant relationship between achievement in the test and the final examination. The correlation values that are on the VERY HIGH and HIGH scale indicate that for each course studied, students will show the same performance even though they involve different assessment items. The test not only functions as a continuous assessment tool but can also be used to predict the final performance of students. Therefore, through this study, it is hoped that it can help lecturers to identify weak students at the initial stage (test) to ensure that student achievement can be improved through the final examination. Lecturers are advised to pay more serious attention to the analysis of test results and use the data to identify students at risk.

It is a CQI (Continuous Quality Improvement) approach to improve CLO achievement for courses and subsequently help in improving PLO, PEO for the study programs offered. Among other things, as a result of this study, lecturers can identify topics that need to be emphasized to ensure that students can master the topic well. In this regard, lecturers indirectly have the opportunity to produce teaching materials, innovations and appropriate teaching and learning methods or techniques to improve students' understanding of the relevant topics. In addition, the motivation aspect also needs to be given attention so that weak students can be helped progressively.

The role of lecturers as facilitators needs to be more proactive so that students can improve their weaknesses and deficiencies through a more effective and meaningful approach. As a result, students and lecturers receive positive benefits collectively in addition to being able to improve the quality and achievement of courses in particular (CLO) and programs (PLO) in general. Future research may consider comparing Engineering Mathematics courses with other technical or non-technical subjects like Programming or Communication Skills to explore whether the strength of this correlation is unique to mathematical disciplines. It would also be beneficial to investigate how different assessment formats impact student outcomes and confidence levels.

SENSE3 SQUARE: A SIMPLE APPROACH TO SOLVE DOOLITTLE AND CROUT METHOD

Fazaliana Zamzuri*, Zuraini Ibrahim, Noor Azilla Md Radzi

Mathematics, Science, and Computer Department, Politeknik Tuanku Sultanah Bahiyah, 09000 Kulim, Kedah, Malaysia

*Corresponding author e-mail address: fazaliana205@gmail.com

Abstract

Sense3 Square is an innovative learning kit designed to improve students' understanding of the Crout and Doolittle Methods in the Numerical Method topic of Engineering Mathematics 3. Many third-semester polytechnic students struggle to understand the Crout and Doolittle methods in Engineering Mathematics 3, leading to a failure rate of over 50% in written tests. Many third-semester polytechnic students struggled with linear equations, as shown by a 46% failure rate in the Session II 2023/2024 test. Additionally, 38% of 83 surveyed students reported difficulty with 3x3 matrix multiplication. These findings served as a guide for developing Sense3 Square as a step to enhance skills in solving linear equations using the Crout and Doolittle Methods. Using the ADDIE model (Analysis, Design, Development, Implementation, Evaluation), Sense3 Square integrates sight, touch, and hearing to support kinesthetic learning. This multi-sensory approach aims to reduce common calculation errors and enhance conceptual understanding, ultimately boosting students' performance in solving systems of linear equations.
Keywords: ADDIE; Crout method; Doolittle method.

1. Introduction

Teaching aids enhance student engagement and understanding, moving beyond traditional chalk-and-talk methods. The use of teaching aids during Teaching and Learning (TnL) sessions greatly helps teachers enhance students' understanding of a particular topic This learning aid can help students improve their academic performance as well as enhance their higher-order thinking skills which were progressing from knowing and understanding to solving problems involving the levels of application, analysis, evaluation, and eventually creation (Ghazali & Setambah, 2024). These tools, which range from non-electronic models and charts to modern digital applications, are essential for improving academic performance and developing higher-order thinking skills, as students' progress from simple knowledge to complex problem-solving and creation (Wang & Abdullah, 2024). In mathematics education, particularly at the tertiary level, these aids capture student interest and foster conceptual mastery, especially in challenging subjects like numerical methods. Numerical methods, a foundational topic in engineering mathematics, are often difficult for students, leading to high failure rates (Voon et al., 2024). While historically dominant, traditional teaching methods are less effective in addressing these topics' abstract and complex nature, often failing to provide the interactive and visual support many students need to succeed (Meylani, 2024). This has spurred a growing body of research advocating integrating technology-enabled learning tools to improve student outcomes in STEM disciplines.

A significant number of studies have highlighted the benefits of technology-enabled learning over traditional approaches. For instance, research by Luo & Zhou (2024) found that students using interactive digital tools in a blended learning environment demonstrated a 25% higher pass rate in numerical methods compared to their peers in traditional classrooms. Similarly, Sun et al.'s (2024) meta-analysis concluded that technology-enhanced instruction significantly improves student motivation, engagement, and conceptual understanding in mathematics.

These findings underscore the need for innovative instructional aids that can bridge the gap left by traditional methods.
In response to this pedagogical challenge, Sense3 Square is an innovative teaching aid specifically developed for engineering mathematics students. It is designed to support lecturers and learners in grasping complex numerical methods, such as LU decomposition using the Crout and Doolittle approaches. This study aims to enhance the development of Sense3 Square using the ADDIE instructional design model, which consists of five phases: Analysis, Design, Development, Implementation, and Evaluation. By following a structured design process, we can ensure the teaching aid is relevant, adaptable, and effective across various educational levels—from secondary schools to higher education institutions, especially in STEM-related disciplines. The objectives of this study are:

1. To determine the percentage of students who face difficulties in understanding the Doolittle and Crout methods through a structured questionnaire survey.
2. To design and develop the Sense3 Square teaching aid using the ADDIE instructional design models to support learning in Numerical Methods.

According to statistics from the Test of Engineering Mathematics 3 in Session II 2022/2023, 53% and 46% of students failed the exam in DBM30033 (Mechanical Engineering) and DBM30043 (Electrical Engineering), respectively. An analysis of the test questions revealed that most students consistently struggled with Question 3, which pertains to Numerical Method, due to the complexity of long and structured calculations. Learning difficulties and inactivity in the classroom also contribute to this issue. Traditional learning methods, such as chalk and talk, can cause disorientation and lead to a weak understanding. Meghana et al. (2022) investigated the perception of traditional learning as either active or not. In response to these challenges, the Sense3 Square teaching aid was developed to integrate three sensory elements, sight, touch, and hearing, into a single learning kit with the potential to enhance learning patterns and academic outcomes.

2. Methodology

This study employed a quantitative approach using a structured questionnaire as the main data collection tool. Descriptive statistics were used to analyse students' understanding and identify learning difficulties prior to the development of the teaching aid. A survey method was adopted, aligning with the research objective of assessing practical classroom challenges based on real responses rather than assumptions. According to Taherdoost (2021), research questions in practical studies help address uncertainties through empirical evidence.

The population for this study consisted of all students enrolled in the Engineering Mathematics 3 course at Politeknik Tuanku Sultanah Bahiyah. To ensure the sample size was statistically sufficient and representative of this population, the study used a random sampling technique and determined the required sample size using a widely accepted formula for finite populations (Krejcie & Morgan, 1970).

The calculated minimum required sample size was 80 based on a total population (N) of 100 Engineering Mathematics 3 students enrolled in the course. The number of respondents, 83, met this minimum requirement, confirming the statistical sufficiency and reliability of the sample for this study.

The data were analysed using descriptive statistics, focusing on frequency and percentage distribution across five Likert scale levels: Strongly Agree (5), Agree (4), Not Sure (3), Disagree (2), and Strongly Disagree (1). The results reflect students' understanding of the Crout and Doolittle methods, particularly in 3x3 matrix multiplication.

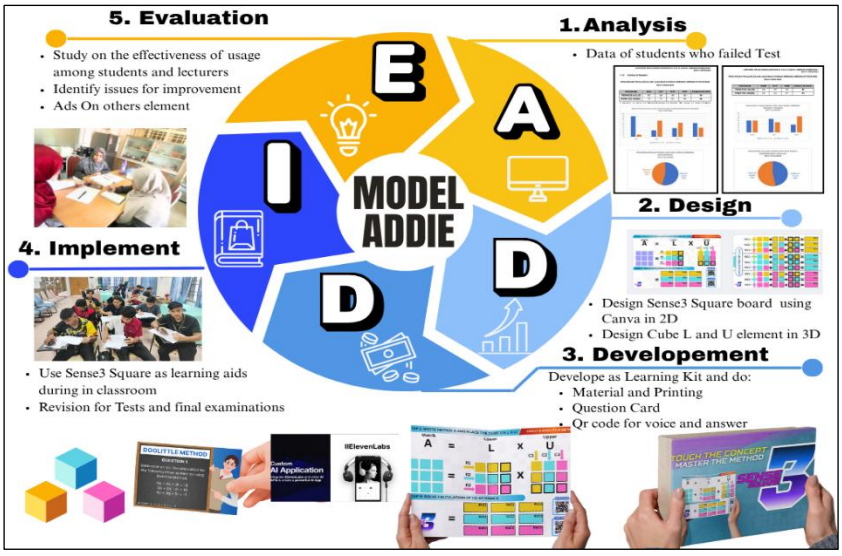

Fig. 1. Five phases of ADDIE (Development process of Sense3 Square)

The method for creating Sense3 Square was developed by exploring creative ideas using the ADDIE model as a structured framework. As shown in Figure 1, the five phases: Analysis, Design, Development, Implementation, and Evaluation represent a dynamic and flexible guideline that enhances the effectiveness of this teaching aid. According to Adeoye et al. (2024), the ADDIE model is a trusted instructional design framework that is widely used in research and proven effective in education. The process began with analysing results from a Theory Test on the Numerical Method topic and a questionnaire study on students' understanding of LU Matrix Multiplication in the Doolittle and Crout Methods. The analysis identified a key issue: students' weakness in matrix multiplication, often due to poor focus. A sensory-based approach was adopted, as the students' demonstrated difficulty concentrating.

As illustrated in Figure 2, the design integrates the five primary senses: sight, hearing, touch, taste, and smell that converge toward the brain, symbolising how sensory inputs can enhance learning. Fan et al. (2024) highlighted that the core principle is simple and powerful. When learners engage with content through multiple senses, they form stronger neural connections, leading to deeper understanding and longer retention. Next, 2D and 3D designs were created for the matrix multiplication board and cube elements. These designs incorporated vibrant colours to increase user engagement. Once the designs were finalised, the Sense3 Square prototype was developed and tested with two sensory elements: sight and touch. A QR code was also integrated to allow students access to questions and instructions via AI-generated voice, addressing the hearing element. Finally, the Sense3 Square was implemented with users and evaluated to identify areas for improvement.

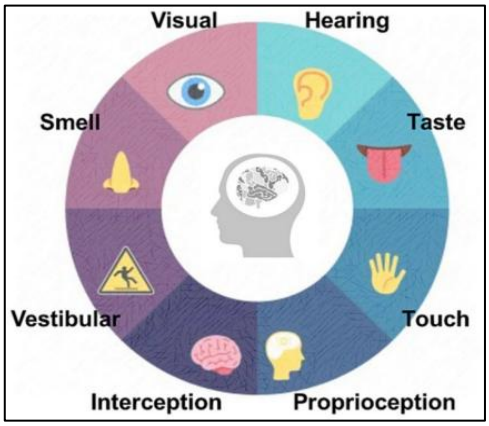

Fig. 2. Fan et al. (2024) highlight the five primary senses (Smell, Visual, Hearing, Taste and Touch)

3. Results and Discussion

The data from the student questionnaire were analysed using simple descriptive statistics. The analysis provides insights into the students' understanding and perceptions of the Crout and Doolittle methods, particularly in 3x3 matrix multiplication in traditional learning and before using any innovation of teaching aid. A total of 83 students who participated in the intervention responded to the questionnaire distributed after implementing both intervention phases. The questionnaire employed a five-point Likert scale (1 = Strongly Disagree, 5 = Strongly Agree). The instrument's reliability was tested and analysed using SPSS version 27, which produced Cronbach's alpha value of 0.898. According to Chua (2020), a Cronbach's alpha value of ≥ 0.7 indicates that the constructed items have good validity and are acceptable. Table 4 presents a summary of the students' questionnaire findings.

Table 1. Analysis of students' understanding and perceptions of the Crout and Doolittle Methods

No.	Item	Strongly Disagree 1	Disagree 2	Not Sure 3	Agree 4	Strongly Agree 5	Mean
1.	I can use the Matrix system (3 x 3).	0%	1%	11%	31%	51%	4.31
2.	I understand the 3x3 Matrix Multiplication technique in the Crout and Doolittle methods.	5%	15%	23%	22%	35%	4.19
3.	I am able to solve LU Multiplication to obtain the value of each element.	6%	14%	22%	29%	29%	4.19
4.	I am able to solve the next step, which is LY = B.	0%	5%	16%	37%	42%	4.17
5.	I am able to complete the next step, which is UX = Y, to obtain the values of X, Y, and Z	0%	5%	23%	29%	43%	4.10
6.	The lecturer makes full use of the whiteboard in teaching the Crout and Doolittle methods	0%	1%	10%	17%	72%	4.61
7.	The lecturer uses teaching aids in teaching the Crout and Doolittle methods	4%	11%	19%	18%	48%	3.93
8.	I understand the 3x3 Matrix Multiplication technique for the Crout and Doolittle methods as explained by the lecturer using whiteboard and book.	2%	14%	17%	27%	40%	4.33

The data in Table 1 provides critical insights into students' understanding of 3×3 matrix multiplication and their experiences with traditional teaching approaches before introducing the Sense3 Square. Most students demonstrated confidence in basic matrix operations, as shown by Item 1 with a mean score of 4.31. However, their understanding was weakened when they faced the more complex LU decomposition stages. Yap et al. (2021) found that students often fail to grasp complex linear algebra techniques without visual and interactive representations, especially when only traditional methods are used. Specifically, 38% of students were unsure or disagreed about their ability to solve LU element values in Item 2, which had a mean of 4.19. Similar uncertainty appeared in the subsequent steps involving solving LY equals B in Item 4, with a mean of 4.17, and UX equals Y in Item 5, with a mean of 4.10. These declining mean scores highlight a growing conceptual gap as tasks become more abstract and computationally demanding. Rahma et al. (2025) reported that abstract mathematical procedures, such as LU decomposition, require more than verbal instruction as students benefit significantly from guided visualisation and repeated practice.

Although lecturers relied heavily on the whiteboard, as reflected by Item 6 with a mean of 4.61, the use of interactive teaching aids was inconsistent and received a lower mean of 3.93 in Item 7, with nearly a third of students expressing uncertainty or disagreement about their effectiveness. Subramaniam & Rosli (2024) emphasised that teaching aids must be contextually appropriate and adapted to the content level, or they risk becoming distractions rather than support tools While some understanding was achieved through whiteboard and book explanations, as shown in Item 8 with a mean of 4.33, about 33 % of students still lacked confidence, which reflects the limitations of passive teaching methods. Direnga (2021) suggested that static materials alone are ineffective unless paired with active questioning, peer interaction, or hands-on demonstration.

These findings confirm that traditional instruction alone does not fully address diverse learning needs. This underscores the necessity of an innovative multi-sensory approach like the Sense3 Square to actively engage students and strengthen their comprehension of the Doolittle and Crout methods. The development and implementation of the Sense3 Square learning kit were guided by the ADDIE instructional design model that comprises five phases: Analysis, Design, Development, Implementation, and Evaluation. Its instructional philosophy is grounded in sense elements: sight, touch, and hearing. The combined model addresses challenges students face in understanding 3x3 matrix multiplication and LU decomposition. Sense3 Square was developed through brainstorming sessions and the exploration of creative ideas. The ADDIE design technique was also applied to create this innovative learning kit. Several testing phases were conducted to determine the specifications and functional design of Sense3 Square until it was successfully implemented.

Based on students' weaknesses in test failure data, it guided the need for a structured, step-by-step solution approach. Sridhar & Balamurugan (2025) emphasised that logical structure and cognitive scaffolding improve comprehension in mathematics. The design phase focuses on the sight element, which involves putting the colour codes on the pattern board and the 3D cube for the touch element, which allows hands-on manipulation of the L and U matrices. Development is a crucial phase in producing a complete learning kit. To incorporate sound as a hearing element, an AI-generated voice is the best approach to assist students, along with question and answer cards that can be accessed via QR code. Gatchalian & Leon (2023) found that combining audio and visuals boosts engagement and long-term recall. A prototype of Sense3 Square will be used during classroom teaching, exam revision, and group activities for Numerical Methods. This implementation phase evaluates whether students can successfully solve problems and demonstrate understanding using the learning kit. Garner & Gabitova (2022) highlighted that tactile learning tools reduce stress and promote positive emotional learning in the STEM classroom.

Based on student feedback and classroom observation, the evaluation phase surveys the kit's effectiveness after implementation. Post-use evaluation is conducted through student questionnaires and performance comparisons. Wang (2021) emphasised that continuous feedback is essential for iterative design improvements in educational kits, particularly when addressing conceptual learning. Sense3 Square has significantly impacted classroom teaching time, addressing difficulties in matrix multiplication and enhancing performance in the Theory Test, which previously had a less than 50% pass rate.

4. Conclusion

The development of the Sense3 Square learning kit, guided by the ADDIE model and enhanced through multi-sensory SENSE elements, has proven to be a valuable innovation in supporting students' understanding and applying the Crout and Doolittle methods in numerical methods. Data from the structured questionnaire confirmed that traditional teaching strategies relying solely on chalk and talk were insufficient, with 38% of students lacking confidence in mastering matrix multiplication steps. Even when some teaching aids were used, they were

often static, passive, or misaligned with students' needs, leading to disengagement and persistent knowledge gaps. In direct response to these issues, the Sense3 Square was successfully designed, developed, and implemented using the ADDIE instructional design model. Integrating the sensory elements of sight, touch, and hearing into a cohesive, interactive learning kit allowed students to engage with abstract concepts in a concrete, hands-on way. Introducing colour-coded 3D cubes for tactile learning and AI-generated voice instructions addressed diverse learning preferences, fostering active participation and deeper conceptual understanding.

The development process of the Sense3 Square proved that a multi-sensory approach significantly enhances comprehension and retention in challenging STEM topics. Its lightweight, interactive, and user-friendly design allows lecturers and students to engage more effectively in teaching and learning. Moving forward, iterative refinements should continue based on ongoing feedback. Nevertheless, wider implementation of the Sense3 Square should be explored within polytechnics and other institutions teaching numerical methods. Moreover, expanding this sensory-based approach to other complex engineering topics could further reduce failure rates, improve engagement, and transform learning outcomes in STEM education.

Abstract

This study aims to analyse the influence of financial literacy and lifestyle on the consumer behaviour of those who use the Dana application in the Siti Rejo I sub-district of Jalan Sakti Lubis Gang Karyawan Medan. The research method used is quantitative with a survey approach. The research sample was taken using a purposive sampling technique, with 50 respondents from residents or students who use the Dana application. Data were collected through questionnaires and analysed using multiple linear regression. The results showed that financial literacy had a negative and significant effect on consumer behaviour, while lifestyle had a positive and significant effect. These findings indicate that increasing financial understanding can reduce consumer behaviour, while a consumer's lifestyle strengthens it. Therefore, students need to improve their financial literacy as an effort to control spending, especially in the use of digital wallets.
Keywords: Financial literacy, Lifestyle, Consumer behaviour, Fund applications.

1. Introduction

The development of digital technology has significantly changed various aspects of life, including payment systems and personal financial management. One widely used innovation today is digital wallets (e-wallets), such as the Dana app. The convenience, speed, and various attractive features offered by these apps have made them popular, especially among younger generations such as students. However, behind this convenience is the potential for uncontrolled consumer behaviour, especially if users lack adequate financial literacy.

According to Wiyanto, Putri, and Budiono (2019), personal financial planning is crucial because it is a self-learning process where each individual must be able to manage their finances. Good financial behaviour can improve living standards, minimise the risk of financial disaster, make optimal investments, and accumulate wealth over a short period. Good financial behaviour can be seen from the habit of recording monthly expenditures, determining and setting goals and tasks for each financial item, carrying out financial activities according to income, and being able to separate needs from wants (Husni Mubarok, 2017). This research was conducted on residents or students in the Siti Rejo I sub-district, Jalan Sakti Lubis Gang Karyawan Medan, as one of the active users of financial technology in everyday life. By understanding the relationship between financial literacy, lifestyle, and consumer behaviour, it is hoped that it can become a basis for developing financial education strategies and developing wiser consumption habits among the residents of the Siti Rejo I sub-district, Jalan Sakti Lubis Gang Karyawan Medan.

2. Methodology

This study uses a quantitative approach. Primary data were collected through questionnaires from 50 respondents who use the DANA application. The variables used are financial literacy (X1), Lifestyle (X2), and Consumptive behaviour (Y). This study was conducted in the Siti Rejo I sub-district among Jalan Sakti Lubis Gang Karyawan Medan residents in April 2025. The population in this study were students and residents. The population used in the study was a portion of residents who use the Dana application, totalling 150 people. This number became the basis for determining the population in this study. The sample in this study used the Slovin formula, which is as follows:

$$n = \frac{N}{1+N\ e^2} \quad (1)$$

Information:
n: Number of samples
N: Population size
margin of error (0.10 for 10%)

This study employed a quantitative data collection method with a survey approach, using an online questionnaire based on a 1-5-point Likert scale as the primary instrument. This method was chosen because it aligns with the research objective of measuring and testing the relationship between financial literacy, lifestyle, and consumer behaviour variables. The analysis will calculate the coefficient of agreement between the numbers and the total value of the existing question numbers. Validity testing will be conducted using SPSS version 22. If the calculated r value > r table (at a significance level of 0.05) and the sig. Value (p-value) < 0.05, then the statement item is declared valid. If the calculated r value < r table (at a significance level of 0.05) and the sig. Value (p-value) > 0.05, then it is declared invalid and can be considered for disposal or correction.

Reliability tests measure an instrument's consistency (reliability).(Sugiyono, 2019)This test was conducted using Cronbach's Alpha technique. If the Cronbach's Alpha value ≥ 0.60, then the instrument is declared reliable or consistent. If the Cronbach's Alpha value is < 0.60, then the instrument is declared less reliable. Multiple linear regression tests determine the effect of more than one independent variable (X) on one dependent variable (Y) simultaneously or partially. The variables are financial literacy, lifestyle, and consumer behaviour. The general regression equation used is:

$$Y = \alpha + \beta 1X1 + \beta 2X2 + e \quad (2)$$

Information:
Y = Consumer Behaviour
α = Constant
β1, β2 = Regression coefficients
X1 = Financial Literacy
X2 = Lifestyle
e = Error

3. Results and Discussion

In this study, validity testing was conducted using correlation techniques, namely by measuring the relationship between each question item's score and the relevant variable's total score. The instrument is declared valid if the calculated r-value is greater than the table r-value and the significance value is <0.05, indicating that the item is suitable for measuring the construct in the study. All items (X1.1 to X1.10) have a calculated r value greater than the r-table and a significance value <0.05, so it can be concluded that all items are valid to

measure the Digital marketing construct at a significance level of 0.05. This means that each item in the questionnaire has a significant and strong correlation to the total score of each construct, so that all the instruments proposed are declared valid and suitable for use in the data collection process.

Table1. Results of the validity test of the research Instrument X1

No	Item	r Count	r Table (0.05)	Sig. (2-tailed)	Information
1	X1.1	0.630	0.254	0	Valid
2	X1.2	0.698	0.254	0	Valid
3	X1.3	0.761	0.254	0	Valid
4	X1.4	0.805	0.254	0	Valid
5	X1.5	0.728	0.254	0	Valid
6	X1.6	0.848	0.254	0	Valid
7	X1.7	0.820	0.254	0	Valid
8	X1.8	0.683	0.254	0	Valid
9	X1.9	0.820	0.254	0.015	Valid
10	X1.10	0.275	0.254	0.027	Valid

All indicators X1.1 to X1.10 have a calculated r value greater than the table r and a significance value below 0.05, so it can be concluded that all indicators are valid.

Table 2. Results of the validity test of the research instrument X2

No	Item	r Count	r Table	Sig. (2-tailed)	Information
1	X2.1	0.853	0.254	0.011	Valid
2	X2.2	0.665	0.254	0	Valid
3	X2.3	0.907	0.254	0.036	Valid
4	X2.4	0.905	0.254	0	Valid
5	X2.5	0.889	0.254	0.002	Valid
6	X2.6	0.898	0.254	0	Valid
7	X2.7	0.913	0.254	0	Valid
8	X2.8	0.753	0.254	0	Valid
9	X2.9	0.899	0.254	0	Valid
10	X2.10	0.787	0.254	0	Valid

All indicators X2.1 to X2.10 have a calculated r value greater than the table r and a significance value below 0.05, so it can be concluded that all indicators are valid.

Table 3. Results of the validity test of research instrument Y

No	Item	r Count	r Table	Sig. (2-tailed)	Information
1	Y1	0.724	0.254	0	Valid
2	Y2	0.552	0.254	0	Valid
3	Y3	0.825	0.254	0	Valid
4	Y4	0.779	0.254	0	Valid
5	Y5	0.764	0.254	0	Valid
6	Y6	0.787	0.254	0	Valid
7	Y7	0.820	0.254	0	Valid
8	Y8	0.716	0.254	0	Valid
9	Y9	0.832	0.254	0.01	Valid
10	Y10	0.730	0.254	0	Valid

All indicators Y1 to Y10 have r count > r table and sig. < 0.05, so they are declared valid. An instrument is considered reliable if the Cronbach's Alpha value is > 0.60. The closer the value

is to 1, the higher the instrument's reliability. This test is crucial to ensure the questionnaire's stability and reliability in measuring the construct being studied.

Table 4. Results of the reliability test of research variables

Model		Unstandardized Coefficients		Standardized Coefficients	t	Sig.
		B	Std. Error	Beta		
1	(Constant)	1,643	2,659		.618	.540
	Financial Literacy	.204	.131	.210	1,556	.126
	Lifestyle	.698	.135	.699	5,180	.000
a. Dependent Variable: CONSUMER BEHAVIOR						

The reliability test results in the table above show that all statement items in the independent variables, namely financial literacy and lifestyle, and the dependent variable, consumer behaviour, are above 0.60. This indicates that each construct in Financial Literacy used in this study is reliable and has good internal consistency. Multiple linear regression testing determines the effect of more than one independent variable (X) on a single dependent variable (Y) simultaneously or partially. This model is suitable for research involving complex constructs such as the Technology Acceptance Model (TAM).

Table3. Multiple linear regression test

Model		Unstandardized Coefficients		Standardized Coefficients	t	Sig.
		B	Std. Error	Beta		
1	(Constant)	1,643	2,659		.618	.540
	FINANCIAL LITERACY	.204	.131	.210	1,556	.126
	LIFESTYLE	.698	.135	.699	5,180	.000

The multiple linear regression test results indicate that of the two independent variables tested, only Financial Literacy has a positive and partially significant influence on Lifestyle. Meanwhile, Consumption behaviour does not have a significant influence. This means that Financial Literacy plays a greater role in driving Lifestyle.

4. Conclusion

Financial literacy (X1) negatively and significantly influences consumptive behaviour in Generation Z in Siti Rejo 1 Village, Jalan Sakti Lubis Gang Pegawai, Medan City. Thus, with better financial literacy, Generation Z will better understand basic financial concepts such as budgeting, savings, investment, and debt. Therefore, it can help them make wiser financial decisions and avoid consumptive behaviour that can harm long-term finances. Lifestyle (X2) negatively and significantly influences consumptive behaviour in Generation Z in Medan. Thus, good self-control will help Generation Z manage impulsive shopping desires and focus on more important financial priorities. This includes saving for the future, paying off debt, and making profitable investments. Generation Z in Depok City experiences significant negative consumptive behaviour due to financial literacy (X1) and Lifestyle (X2). Therefore, this can be interpreted as an increase in financial literacy and Lifestyle simultaneously/together towards consumptive behaviour.

Abstrak

Mini projek pelajar merupakan aktiviti pembelajaran yang sangat penting kepada pelajar. Ini kerana ia membantu meningkatkan kemahiran praktikal, pemikiran kritis, dan keupayaan menyelesaikan masalah dalam situasi dunia sebenar. Namun begitu, timbul persoalan, sejauh mana aktiviti dalam mini projek dapat memupuk budaya STEM dalam kalangan pelajar. Isu ini timbul kerana apabila mini projek dijalankan secara berkumpulan, terdapat risiko ketidakseimbangan dalam pembahagian tugas, di mana sesetengah ahli kumpulan mungkin kurang menyumbang, menyebabkan beban kerja tidak diagihkan secara adil. Begitu juga boleh berlaku konflik atau perbezaan pendapat antara ahli kumpulan boleh timbul, yang berpotensi mengganggu kelancaran dan keberkesanan pelaksanaan projek. Justeru itu kajian ini dijalankan adalah untuk menilai sendiri dari perspektif pelajar tentang peranan mini projek kursus engineering science dalam memupuk budaya STEM dalam kalangan pelajar. Seramai 74 orang di Politeknik Kuching Sarawak, terlibat dalam kajian ini. Analisis kajian ini menggunakan analisis deskriptif untuk mengukur tahap persetujuan pelajar terhadap item kajian dalam soal selidik berdasarkan nilai min. Hasil kajian mendapati bahawa majoriti pelajar bersetuju bahawa mini projek kursus engineering science dapat memupuk budaya STEM dalam kalangan pelajar. Kajian ini penting kerana ia dapat menilai sejauh mana pendekatan yang dimainkan oleh mini projek yang diperkenalkan oleh institusi atau pensyarah mampu meningkatkan kemahiran teknikal, pemikiran kritis, dan minat pelajar terhadap bidang STEM, sekaligus menyokong pembangunan modal insan yang berdaya saing.
Kata kunci: STEM; Mini projek; Kursus Engineering Science.

1. Pengenalan

STEM ialah program pendidikan yang dibangunkan untuk menyediakan pelajar sama ada di peringkat sekolah rendah dan menengah hinggalah ke kolej, pengajian siswazah dan kerjaya dalam bidang sains, teknologi, kejuruteraan dan matematik (STEM). Sebagai tambahan kepada pembelajaran khusus subjek, STEM bertujuan untuk memupuk minda bertanya, penaakulan logik dan kemahiran kerjasama (Lutkevich, 2025). STEM di institusi pengajian tinggi mengajar pelajar berfikir secara kritis, menyediakan mereka untuk kerjaya, dan melatih mereka menyelesaikan masalah sukar dari pelbagai bidang sains. Dapat penulisan Muniz (2023) menjelaskan bahawa senario hari ini mendapati pekerjaan dalam bidang STEM mendapat permintaan tinggi, dan kebanyakannya permintaan dijangka kekal dan terus meningkat selama beberapa tahun. Sekiranya dilihat situasi di luar negara pada masa ini, seperti kerajaan Amerika, mereka sangat menggalakkan pelajar untuk belajar STEM kerana negara tersebut kekurangan tenaga profesional dalam bidang STEM. Ini dapat dibuktikan apabila pada 2019, pentadbiran Trump melabur $578 juta dalam pendidikan STEM (Muniz, 2023). Bidang STEM sangat penting kerana menurut National Science Foundation pekerja STEM menyumbang kepada taraf hidup dan pertumbuhan ekonomi negara. Tidak menghairankan bahawa Biro Statistik Buruh Amerika mengunjurkan bahawa pekerjaan dalam

bidang STEM dijangka berkembang sebanyak 10.8% hingga 2032, berbanding dengan 2.3% untuk pekerjaan bukan STEM.

Kursus Engineering Science membawa pelajar mengenali dan mengaplikasi konsep fizik dalam topik-topik seperti pergerakan linear, daya, konsep kerja, tenaga dan kuasa. Pelajar diploma politeknik akan mengambil kursus ini pada semester satu peringkat pengajian. Pelajar seharusnya boleh mengaplikasikan konsep matematik, sains, asas kejuruteraan dan kejuruteraan khusus merangkumi semua aspek kejuruteraan dalam peringkat program pengajian mereka. Penghasilan produk dalam mini projek kursus ini menimbulkan minat dan memupuk sifat kreatif pelajar dalam menghasilkan produk atau mesin ringkas yang mengaplikasi konsep sains dan kejuruteraan dalam penciptaan mereka.

Berdasarkan kepada senario ini, budaya STEM perlu dipupuk dalam kalangan pelajar khususnya pelajar dalam institusi TVET. Di Politeknik Kuching Sarawak, dalam membudayakan STEM dalam kalangan pelajar, mini projek telah diperkenalkan dalam kursus kejuruteraan sains sebagai inisiatif awal. Ini kerana kerana melalui mini projek dilihat dapat membekalkan pengalaman pembelajaran praktikal yang menggabungkan semua elemen STEM dalam konteks dunia sebenar. Melalui mini project, pelajar bukan sahaja mempelajari teori tetapi juga mengaplikasikan konsep sains, menggunakan teknologi, mereka bentuk penyelesaian kejuruteraan, dan menggunakan matematik untuk menyelesaikan masalah yang rumit. Mini project juga mewujudkan persekitaran pembelajaran kolaboratif di mana pelajar bekerja dalam pasukan, berkomunikasi secara berkesan, dan belajar daripada kesilapan, di mana inilah kemahiran penting yang diperlukan dalam kerjaya STEM. Namun begitu, walaupun mini projek dalam kursus Engineering Science dilihat berpotensi untuk memupuk budaya STEM dalam kalangan pelajar, tahap persetujuan pelajar terhadap keberkesanan pendekatan ini masih belum dapat dipastikan. Ini kerana pelajar merupakan unit peserta aktif dalam proses pembelajaran ini. Maklum balas pelajar yang mengikuti mini projek adalah penting untuk menjelaskan tahap keberkesanan sebenar mini projek dalam memupuk budaya STEM. Justeru itu berdasarkan kepada isu ini, objektif kajian ini dijalankan adalah untuk mengenal pasti peranan mini projek kursus engineering science dalam memupuk budaya STEM dalam kalangan pelajar.

Banyak kajian membincangkan hubungan antara STEM dan juga mini projek (Ambo, 2022; Nutramara, 2023; Suryonegoro, 2025). Mini projek memainkan peranan penting dalam pendidikan, terutama dalam memperkaya pengalaman pembelajaran pelajar. Melalui pendekatan Pembelajaran Berasaskan Projek (PBP), pelajar tidak hanya memperoleh pengetahuan teori tetapi juga pengalaman praktikal yang diperlukan dalam situasi dunia sebenar. Menurut Sulong dan Sulong (2022), PBP memfokuskan pembelajaran kepada pelajar, memupuk sikap proaktif, kemahiran penyelesaian masalah, serta berfikiran kritis dan kreatif. Ini kerana pendekatan ini memberikan ruang kepada pelajar untuk menghasilkan produk atau inovasi, menyokong teori konstruktivisme yang menekankan pentingnya belajar dengan melakukan secara praktikal. Dengan melaksanakan gabungan aktiviti STEM berasaskan projek dalam pembelajaran teradun mempunyai potensi besar untuk melibatkan pelajar dalam pengalaman pembelajaran tulen dan praktikal yang menghubungkan pengetahuan teori dengan aplikasi praktikal (Kelley & Knowles, 2016). Kaharudin (2023) juga menjelaskan bahawa pelaksanaan projek dalam pembelajaran dapat melibatkan pelajar dalam merancang, melaksanakan, dan membentangkan hasil kerja mereka, sekaligus membina kemahiran kolaboratif dan komunikasi.

Dari aspek peranan mini projek dalam STEM, Mustaza (2021) menjelaskan bahawa projek pementoran dalam STEM dapat membantu meningkatkan kemahiran teknikal pelajar serta menggalakkan mereka untuk bersaing dan belajar dalam persekitaran yang kondusif dan menyokong. Ini selari dengan pandangan Zavalevskyi (2023) di mana STEM, menumpukan pada pembangunan pemikiran kritis, penyelesaian masalah dan kemahiran kerjasama melalui pendekatan bersepadu untuk pembelajaran. Sebelum ini Huang, (2020) juga menyatakan

bahawa pelaksanaan pendidikan STEM telah dibuktikan dapat meningkatkan kebolehan menyelesaikan masalah, kreativiti dan kemahiran inovasi pelajar. Begitu juga dengan kajian Fini (2018) dan Domenici (2022) telah menunjukkan keberkesanan aktiviti STEM berasaskan projek dalam meningkatkan hasil pembelajaran pelajar, meningkatkan motivasi, dan menyediakan pelajar untuk kerjaya masa depan dalam bidang STEM. Antara kejayaan mini projek juga diterangkan oleh Simatupang (2021) di mana beberapa projek berorientasikan STEM dan bahan pengajaran penyelidikan mini yang dicipta oleh pelajar prasiswazah telah digunakan di sekolah sebagai sumbangan kampus kepada sekolah.

2. Metodologi

Kajian ini dijalankan dengan menggunakan pendekatan kaedah kuantitatif. Kaedah kuantitatif yang digunakan dalam kajian ini merujuk kepada pendekatan penyelidikan yang menggunakan data berbentuk angka untuk menganalisis dan memahami fenomena tertentu iaitu sejauh mana peranan mini projek kursus engineering science dalam memupuk budaya STEM dalam kalangan pelajar. Kajian ini melibatkan pengumpulan data melalui kaedah seperti soal selidik, yang kemudiannya dianalisis menggunakan statistik. Seramai 74 orang pelajar di Politeknik Kuching Sarawak, terlibat dalam kajian ini. Instrumen kajian ialah soal selidik Likert 5 skala yang dibina sendiri berdasarkan peranan mini project kursus engineering science dalam memupuk budaya STEM, yang telah dibincangkan secara meluas dalam kajian lepas. Analisis kajian ini menggunakan analisis deskriptif untuk mengukur tahap persetujuan pelajar terhadap item kajian dalam soal selidik berdasarkan nilai min, dengan tafsiran tahap mengikut skala seperti yang digunakan oleh Ngadiman (2019): 1.00–1.99 (Lemah), 2.00–2.99 (Rendah), 3.00–3.99 (Sederhana) dan 4.00–5.00 (Tinggi).

3. Dapatan dan Perbincangan

a) Latar belakang responden

Jadual 1. Latar Belakang Responden

Item		%	n
Jantina	Lelaki	55.4	41
	Perempuan	44.6	33
Jabatan	JKE	14.9	11
	JKM	38.5	28
	JKA	47.3	35
Semester	1	50	37
	2	50	37
HPNM	1.01 - 2.00	10.8	8
	2.01 - 3.00	41.9	31
	3.01 - 4.00	47.3	35

Kajian ini melibatkan 74 responden dari Politeknik Kuching Sarawak (lelaki - 55.4%; perempuan - 44.6%). Responden terdiri daripada pelajar Jabatan Kejuruteraan Elektrik (JKE) sebanyak 14.9% (11 orang), Jabatan Kejuruteraan Mekanikal (JKM) sebanyak 38.5% (28 orang), dan Jabatan Kejuruteraan Awam (JKA) sebanyak 47.3% (35 orang). Dari segi pencapaian akademik (HPNM), majoriti pelajar mempunyai HPNM antara 3.01 - 4.00 (47.3%, 35 orang), diikuti oleh HPNM 2.01 - 3.00 (41.9%, 31 orang), dan HPNM 1.01 - 2.00 (10.8%, 8 orang).

b) Peranan Mini Projek Terhadap Budaya STEM

Jadual 2. Analisis Peranan Mini Projek Terhadap Budaya STEM

Bil	Item	S.P	Skor Min
	Tahap Penglibatan Dalam Mini Projek		
1	Terlibat secara aktif dalam semua fasa mini projek	0.683	4.419
2	Menyumbang idea dan pendapat semasa perbincangan	0.681	4.405
3	Mengambil inisiatif untuk mencari maklumat tambahan	0.696	4.378
4	Melaksanakan tugasan dengan penuh komitmen.	0.646	4.486
5	Komunikasi berkesan dengan ahli kumpulan sepanjang projek.	0.687	4.500
	Peranan Mini Projek Dalam STEM		
1	Membolehkan penggunaan teknologi untuk menyelesaikan masalah.	0.743	4.446
2	Meningkatkan kemahiran mereka bentuk kejuruteraan.	0.762	4.459
3	Membantu menggunakan matematik dalam projek kejuruteraan.	0.707	4.473
4	Memperkenalkan penggunaan STEM dalam kehidupan sebenar.	0.778	4.432
5	Menunjukkan hubungan antara sains, teknologi, kejuruteraan, dan matematik.	0.707	4.486
6	Meningkatkan kemahiran berfikir kritis dalam STEM.	0.762	4.459
7	Membolehkan eksperimen untuk menguji idea kejuruteraan.	0.687	4.514
8	Mengaplikasikan kemahiran STEM dalam kejuruteraan.	0.779	4.446
9	Menerangkan kepentingan matematik dalam kejuruteraan.	0.725	4.459
10	Meningkatkan kesedaran tentang kepentingan STEM untuk kelangsungan alam sekitar.	0.775	4.405
11	Membantu meningkatkan kreativiti dalam menyelesaikan masalah STEM.	0.742	4.432
12	Mengajar penggunaan kaedah saintifik dalam kejuruteraan.	0.707	4.473
13	Mendedahkan kepentingan kerja berpasukan dalam projek STEM.	0.726	4.486
14	Meningkatkan minat terhadap kerjaya dalam bidang STEM.	0.707	4.473
15	Meningkatkan kesedaran tentang kepentingan STEM dalam pembangunan teknologi.	0.725	4.459
16	Membantu memahami konsep sains dalam kejuruteraan.	0.707	4.473

Jadual 2 akan menjelaskan peranan mini projek terhadap budaya STEM. Sebelum menarangkan peranan mini projek, perlu juga diterangkan tahap penglibatan pelajar dalam mini projek. Ini kerana pelajar yang terlibat sudah pasti dapat menerangkat kesan sesuatu program. Berdasarkan kepada Jadual 2, tahap penglibatan pelajar dalam pelbagai mini projek adalah tinggi. Ini menunjukkan bahawa pelajar terlibat secara aktif dalam semua fasa projek, termasuk perancangan, pelaksanaan, dan pembentangan (min 4.419). Mereka juga menyumbang idea dan pendapat semasa perbincangan kumpulan (min 4.405) serta mengambil inisiatif mencari maklumat tambahan untuk menyokong projek (min 4.378). Selain itu, pelajar juga menunjukkan komitmen dalam melaksanakan tugasan yang diberikan (4.186) dan berkomunikasi secara berkesan dengan ahli kumpulan sepanjang projek (4.400).

Bagi peranan mini projek dalam memupuk budaya STEM, secara keseluruhannya semua item memperoleh tahap persetujuan yang tinggi daripada responden, di mana semua item memperoleh min melebihi 4.00. Ini menunjukkan bahawa mini projek sangat berkesan dalam membudayakan STEM dalam kalangan pelajar kejuruteraan. Berdasarkan kepada tiga peranan mini projek dalam STEM yang memperoleh skor min tertinggi menunjukkan bahawa mini projek mendedahkan kepada kepentingan kerja berpasukan dalam projek STEM, (min 4.486). Ini menunjukkan bahawa pelajar sangat menghargai kerja berpasukan sebagai elemen penting dalam melaksanakan projek, seperti kolaborasi untuk membantu mereka mencapai matlamat bersama. Selain itu, mini projek juga berjaya menunjukkan hubungan antara sains, teknologi, kejuruteraan, dan matematik (min 4.486). Ini membantu pelajar memahami bagaimana elemen-elemen STEM saling berkait dan diaplikasikan dalam menyelesaikan masalah kejuruteraan. Manakala yang ketiga adalah mini projek

membolehkan pelajar menjalankan eksperimen untuk menguji idea kejuruteraan (min 4.514). Aktiviti ini memberikan pengalaman praktikal yang penting dalam memahami konsep kejuruteraan secara lebih mendalam. Secara keseluruhnya, semua peranan ini membuktikan bahawa mini projek berkesan dalam meningkatkan kemahiran pelajar dan memupuk minat terhadap STEM.

4. Kesimpulan

Mini projek dalam silibus Engineering Science berupaya menimbulkan rasa minat dan menguji kemahiran pelajar dalam menghasilkan produk yang mengikut topik dan memupuk semangat bekerjasama dalam kumpulan di kalangan pelajar. Didapati pelajar mampu menyelesaikan masalah yang timbul dalam penghasilan dan pengujian mini projek mereka. Keadaan ini menimbulkan minat dan keupayaan untuk mencuba dan mengaplikasikan prinsip sains dan matematik dalam menjayakan mini projek mereka. Ini dapat dilihat dalam konteks meningkatkan kreativiti dalam mengaplikasikan konsep sains dalam membina dan menyelesaikan masalah dalam proses penghasilan mini project pelajar di mana skor adalah 4.432 dan 4.472. Skor ini secara tidak langsung menunjukkan pelajar-pelajar berminat dengan aktiviti pembelajaran seperti mini project dalam proses pengajaran dan pembelajaran mereka di politeknik.

Pengenalan kepada STEM dalam membina dan membentuk minat pelajar dalam bidang STEM ini boleh dikembangkan melalui mini project dan sebenarnya pelajar juga didapati mudah menerima unsur-unsur sains dalam mengaplikasikan konsep sains dan matematik dalam menyelesaikan masalah dan menjayakan mini project mereka. Pelajar juga mula menyedari perkembangan kerjaya dalam bidang STEM di negara ini dan kepentingan STEM dalam meneruskan kelangsungan (sustainability) alam sekitar yang menjadi tanggungjawab setiap ahli masyarakat. Perkembangan STEM di kalangan pelajar di peringkat sekolah, politeknik dan institusi pengajian tinggi dilihat dapat menyelesaikan masalah utama dalam bidang kejuruteraan di mana Malaysia kini berada di landasan dalam meuju ke arah negara maju yang bersaing dalam perkembangan sains dan teknologi dunia.

Hasil daripada kajian ini mungkin dapat membuka pandangan dan tanggapan bahawa pelajar adalah amat berminat dengan aktiviti pembelajaran seperti mini projek dalam proses pengajaran dan pembelajaran mereka dan mini project ini membawa pelajar untuk berani merekabentuk sistem, membuat proses ujilari dan kemahiran menyelesaikan masalah selain mengasah kemahiran pelajar dalam mengaplikasi konsep sains dan matematik bagi menghasilkan mini project yang berfungsi dengan baik dengan rekabentuk yang memenuhi konsep terkini. Melalui hasil kajian ini dicadangkan pemerkasaan dan penekanan dalam bidang STEM dalam kandungan kurikulum pengajaran di sekolah, politeknik dan institusi pengajian perlu diperluas dan dikembangkan bagi persediaan pelajar menghadapi bidang sains, teknologi dan kejuruteraan yang semakin maju dan berdaya saing. Pelajar perlu bersedia menghadapi cabaran bidang kerjaya yang sukar dan kemahiran dalam menyelesaikan masalah terutama yang berkaitan dengan kemahiran sains dan matematik bagi menghadapi saingan negara dalam menuju ke arah revolusi 4.0.

*Alamat e-mel penulis: ruslina@pmtg.edu.my

Abstrak

Perkataan *qital* bukanlah sesuatu yang asing bagi masyarakat dunia. Sebelum pengutusan Nabi Muhammad SAW sebagai Rasul, peperangan telah pun berlaku dan berterusan sehingga ke hari ini. Menerusi *Surah al-Baqarah ayat* 190 yang diterjemahkan: "Dan perangilah di jalan Allah orang-orang yang memerangi kamu, tetapi janganlah kamu melampaui batas, kerana sesungguhnya Allah tidak menyukai orang-orang yang melampaui batas." Kajian kualitatif ini menjelaskan bahawa perang bukan semata-mata konflik fizikal. Bahkan, *qital* dalam konteks *fi sabilillah* merujuk secara khusus kepada pertempuran yang merupakan sebahagian kecil daripada konsep *jihad*. Ayat-ayat *qital* dalam penelitian ini melibatkan sebanyak 9 ayat yang secara langsung menggunakan kata *qital* dan 157 ayat lain yang menggunakan bentuk derivasinya. Dari sudut morfologi, derivasi kata *qital* merangkumi *fi'il maḍi* (kata kerja lampau), *fi'il muḍari'* (kata kerja sekarang/akan datang), dan *fi'il amr* (kata perintah). Ayat-ayat *qital* dalam *al-Quran* ditafsirkan oleh para *mufassir* sebagai perintah berperang melawan golongan kafir yang melakukan serangan terhadap umat Islam, iaitu dalam bentuk peperangan defensif (difa'iyyah), dan Islam melarang peperangan yang bersifat menyerang atau ofensif (talabiyyah).
Kata kunci: Qital; Jihad; Derivasi kata.

1. Pendahuluan

Dalam konteks sejarah Islam, peperangan yang dipimpin oleh Rasulullah SAW dicatat ada antara 19 hingga 21 kali *ghazwa* (perang besar) (al-Mubarakfuri, 2002). Seiring dengan itu, *sariyyah* (perang kecil) juga merupakan peperangan yang tidak dipimpin langsung oleh Rasulullah SAW dan terjadi sebanyak 35 hingga 42 kali (Ibn Hisham, 1955). Menurut bahasa, perkataan *qital* merupakan bentuk *masdar* (kata dasar) daripada kata *qatala - yuqatilu* (Ibn Manzur, 1990). Perkataan ini membawa tiga makna utama: pertama, bererti bertarung atau bergaduh dengan seseorang; kedua, bermaksud memusuhi (*'adahu*); dan ketiga, memerangi musuh (*ḥarabahu al-'ada'*) (Al-Fairuzabadi, 1998). Menurut para ahli tafsir, maksud *qital* dalam konteks ini ialah peperangan menentang musuh-musuh Islam daripada kalangan orang kafir (al-Faruqi, 1982).

Menurut Muhammad Abduh, maksud larangan "melampaui batas" dalam surah al-Baqarah, ayat 190 ialah melakukan kekejaman dalam peperangan atau memulakan serangan terhadap pihak yang tidak memerangi umat Islam (Abduh, 1961). Sedangkan *qital* dalam konteks *fi sabilillah* merujuk secara khusus kepada pertempuran yang hanya merupakan sebahagian kecil daripada keseluruhan konsep jihad. Menurut Muhammad Khair Haykal, definisi *syar'i* bagi jihad ialah *al-qital fi sabilillah bi al-shuruṭihi*, yang bermaksud "perang di jalan Allah dengan memenuhi syarat-syaratnya" (Haykal, 2002). Sabda Rasulullah SAW, "Jihad itu akan terus berlangsung sejak Allah mengutusku sehinggalah umatku yang terakhir memerangi Dajjal" (Abu Dawud, n.d.).

Kajian terdahulu termasuk "Deradikalisasi Pemahaman al-Quran (Ayat-ayat Jihad dan Qital)" oleh Husna Amin & Saiful Akmal (2021), "Explaining ISIS: Differences and Misconception of Jihad and Qital" oleh Umi Nur Zahidah (2021), dan "Analisis Pendekatan Interpretasi Syahrur terhadap ayat jihad dan Qital" oleh Ahmad Anas Muhsin (2021). Penegasan Rasulullah SAW bahawa jihad akan berterusan sehingga akhir zaman menunjukkan betapa penting dan relevannya konsep ini dalam konteks syariat Islam (Haykal, 2002).

Istilah qital berasal daripada kata akar Arab "qatala", yang bermaksud membunuh atau berperang. Dalam konteks al-Quran, istilah ini tidak semata-mata membawa makna kekerasan fizikal, tetapi berkait rapat dengan konsep keadilan, pertahanan dan perlindungan terhadap umat Islam (Asad, 2003). Al-Zamakhsyari (n.d.) dan al-Razi (n.d.) menegaskan bahawa ayat-ayat qital mesti difahami berdasarkan konteks sejarahnya, terutamanya asbab al-nuzul. Muhammad Asad (2003) pula menekankan bahawa ayat-ayat perang dalam al-Quran bersifat defensif, bukan agresif. Hal ini turut disokong oleh Fazlur Rahman (1982) yang menegaskan perlunya penafsiran kontekstual.

Kajian oleh Ismail, Arni, Arham, dan Hermanto (2021) mendalami pandangan Sayyid Qutb yang menekankan bahawa qital juga mencakupi aspek ofensif untuk menegakkan kalimat Allah. Kajian oleh Muhsin (2021) meneliti pendekatan hermeneutik moden Muhammad Shahrur yang menolak penafsiran literal dan berusaha memberikan kerangka tafsir yang lebih kontekstual. Kajian oleh Toyib (2022) pula membincangkan bagaimana ayat-ayat qital menekankan prinsip etika dan nilai kemanusiaan yang tinggi, seperti larangan membunuh orang awam.

2. Metodologi

Kajian ini menggunakan pendekatan kualitatif melalui kaedah kajian kepustakaan (library research) (Creswell, 2014). Reka bentuk kajian ini bersifat deskriptif dan analitikal. Kajian ini menggunakan pendekatan tafsir tematik (tafsir mawdu'i). Data utama diperoleh daripada ayat-ayat al-Quran serta kitab-kitab tafsir seperti Tafsir al-Tabari (Al-Tabari, 2001), Tafsir Ibn Kathir (Ibn Kathir, 2000), dan Tafsir al-Qurtubi (Al-Qurtubi, 2006). Kaedah pengumpulan data dilakukan melalui analisis kandungan (content analysis) terhadap teks-teks daripada sumber primer dan sekunder (Creswell, 2014; Wan Daud, 2010). Kaedah analisis data menggunakan pendekatan analisis kandungan untuk meneliti ayat-ayat al-Quran yang mengandungi perkataan qital serta derivatifnya (Krippendorff, 2018).

3. Dapatan dan Perbincangan

Dalam konteks Islam, peperangan yang disyariatkan merangkumi dua kategori utama, iaitu peperangan defensif (jihad difa'i) dan peperangan ofensif (jihad hujumi) (Haykal, 1993). Menurut Abdul Baqi Ramdhun, peperangan secara defensif merujuk kepada perintah berperang yang diturunkan hanya kepada mereka yang secara nyata memerangi umat Islam (Ramdhun, 1995). Peperangan secara ofensif pula merujuk kepada tindakan memerangi golongan kafir melalui serangan langsung, sama ada mereka telah memulakan serangan atau tidak (Ramdhun, 1995). Izin untuk melancarkan peperangan seumpama ini diberikan apabila kezaliman golongan kafir telah melampaui batas, sebagaimana firman Allah SWT dalam Surah al-Hajj, ayat 39 (Al-Razi, n.d.). Allah SWT juga memerintahkan kaum Muslim untuk memerangi orang kafir dalam rangka menghilangkan fitnah (kesyirikan), yang merupakan perintah perang bersifat ofensif (Ramdhun, 1995), seperti dalam Surah Al-Baqarah, ayat 193.

Menurut al-Ṭabari, matlamat utama peperangan ialah untuk menghapuskan segala bentuk kesyirikan (Al-Ṭabari, 2001). Pandangan ini disokong oleh al-Razi yang menyatakan tujuannya adalah memastikan agama Allah sahaja yang ditegakkan (Al-Razi, n.d.). Al-Quran juga menetapkan etika peperangan yang jelas, seperti mematuhi perjanjian damai (Surah al-

Taubah, 9:4), larangan membunuh warga sipil (Surah al-Baqarah, 2:190), dan melayan tawanan perang dengan baik (Surah al-Insan, 76:8).

Terdapat sembilan ayat yang secara langsung menggunakan kata qital dan 157 ayat lain yang menggunakan derivasinya, menjadikan jumlah keseluruhan 166 ayat (Ibn Kathir, 2000; Al-Tabari, 2001). Penggunaan kata qatal dan turunannya muncul sebanyak 170 kali dalam al-Quran. Makna kata qital dan derivasinya bersifat kontekstual; umumnya merujuk kepada "perang," tetapi boleh juga bermakna "membinasakan," "mengutuk" (Surah At-Taubah, 30; Surah al-Munafiqun, 4), "dibunuh" (Surah al-Ahzab, 61), atau "bertengkar" (Surah al-Qashash, 15).

4. Kesimpulan

Dalam konteks geopolitik moden, pemahaman qital perlu dirujuk berdasarkan prinsip maqasid syariah dan bukan dibaca secara literal. Kumpulan ekstremis telah memanipulasi ayat-ayat ini, sedangkan ulama menegaskan bahawa qital terikat dengan syarat seperti wujudnya kezaliman nyata dan perintah pemerintah yang sah. Islam melarang keras pembunuhan orang tidak bersalah (Surah al-Ma'idah, 32) dan cenderung kepada perdamaian (Surah al-Anfal, 61). Hadis Nabi Muhammad SAW juga melarang pembunuhan wanita, kanak-kanak, dan orang tua (Muslim ibn al-Hajjaj, 2007; Abu Dawud, 2008). Ulama kontemporari seperti Dr. Muhammad Tahir-ul-Qadri dan Sheikh Abdulaziz bin Abdullah Al-Ashaykh (Mufti Besar Arab Saudi) telah mengeluarkan fatwa yang menegaskan bahawa keganasan adalah haram dan bertentangan dengan ajaran Islam (Tahir-ul-Qadri, 2010; Al-Ashaykh, 2001).

Kajian ini menunjukkan bahawa konsep qital dalam al-Quran tidak merujuk kepada peperangan konvensional tetapi mempunyai dimensi syariah dan etika yang khusus. Peperangan hanya dibenarkan untuk mempertahankan diri, menentang kezaliman, dan menjaga kebebasan beragama, dengan etika yang menekankan keadilan dan kemanusiaan. Kepelbagaian makna kata qital mencerminkan perbezaan konteks yang memerlukan tafsiran holistik. Justeru, qital adalah instrumen syariah yang berpaksikan prinsip rahmah, keadilan, dan maqasid al-shari'ah.

Abstract

This study aims to analyze the influence of Love of money, Fear of missing out, and Self-Control on Personal financial planning in Generation Z in Medan City. Generation Z is an age group that is very familiar with technology and social media, so it has the potential to face psychological challenges in managing personal finances. This research uses a quantitative approach with a survey method of 150 respondents aged 18-27 years. The data collection instrument was a questionnaire with a Likert scale, and the data were analyzed using multiple linear regression. The results showed that Fear of missing out and Self-Control have a positive and significant effect on Personal financial planning. In contrast, Love of money did not show a significant effect. Simultaneously, the three variables have a significant effect on Personal financial planning. This finding confirms that psychological and social factors play an important role in Generation Z's financial behavior. Improving self-control and managing the influence of social media are crucial in shaping healthy financial habits among the younger generation.
Keywords: Love of money; Fear of missing out; Self-control.

1. Introduction

Amidst the rapid development of information technology and digitalization of the financial system, Personal financial planning is becoming increasingly important, especially for productive age groups such as Generation Z. Born between 1997 and 2012, this generation has grown up in a world full of information, connectivity, and lifestyle expectations from social media. Unfortunately, various research and news show that many of them do not have the ability to manage their finances effectively. According to an OCBC NISP survey cited by (Sidoarjo, 2024) the majority of Gen Z in Indonesia do not have a clear saving habit or a monthly budget.

The impact of this lack of financial planning is very serious (Budiman, 2023) reported that many young people from Gen Z are trapped in the vortex of illegal online loans (pinjol) due to consumptive behavior and lack of financial control. An article from (Awaludin, 2024) even mentions that many Gen Z face financial insolvency from a young age, due to unplanned spending, lifestyle pressures, and lack of investment awareness and financial protection. This shows that the inability to manage finances not only affects their personal economic situation, but also the mental and social stability of this generation in the future. Personal financial planning itself is the process of managing income, expenses, savings, and investments with the aim of achieving financial stability in the present and future (Keuangan, Khoirunnisa, & Purnamasari, 2024). However, success in financial planning is not only determined by financial literacy, but also by various psychological and social factors that influence individual behavior in managing their finances. This research highlights three main factors that are thought to significantly influence Gen Z's financial planning: Love of money, Fear of missing out, and Self-Control. Behavioral finance develops based on the assumption that individuals often act irrationally. Some of the main indicators of this approach include overconfidence bias, loss aversion, mental accounting, herding behavior, and self-control (Ernanto & Hermawan, 2022). In practice, this theory has been adopted by various studies to examine investment,

consumption, and Personal financial planning decisions. One application is in studies that observe the influence of psychological factors such as Love of money, Fear of missing out, and self-control on financial behavior (Przybylski et al., 2020; Milyavskaya et al., 2021; Tang et al., 2020).

Previous studies have explored the relationship between psychological factors and financial behavior, but they are generally limited. For example, (Dilla Agustin, Nersiwad Nersiwad, & Yuliasnita Verlandes, 2023), found that Love of money has a positive effect on Gen Z financial management in Mojokerto. (Keuangan et al., 2024) stated that Fear of missing out has a significant influence on consumptive behavior, but the Love of money and Self-Control variables do not show influence in the K-Pop fan community. Research (Permadani, 2024) shows that Self-Control is positively correlated with financial behavior but has not been tested directly in the context of long-term financial planning.

Love of money describes a person's view of money as a symbol of status, power, and success. Individuals with high Love of money values tend to pursue money aggressively, but do not necessarily have healthy financial planning habits (Przybylski, Murayama, DeHaan, & Gladwell, 2020). In the context of Generation Z, Love of money is becoming increasingly relevant due to exposure to social media, popular culture, and pressure to demonstrate financial status. Research by (Dilla Agustin et al., 2023) proves that Love of money has a significant effect on Gen Z's personal financial management in Mojokerto. Meanwhile, (Keuangan et al., 2024) stated that Love of money does not always have a significant effect, depending on the respondent's community background (e.g. K-Pop fans). Hypothesis developed: H1: Love of money does not have a significant effect on Personal financial planning in Generation Z.

Meanwhile, Fear of missing out is a psychological phenomenon in which a person is afraid of being left behind in trends or social activities seen through social media. Fear of missing out has been shown to encourage consumptive behavior and impulsive spending (Keuangan et al., 2024). In contrast, self-control is an individual's ability to delay gratification and make rational financial decisions. Individuals with a high level of self-control tend to have more mature financial planning (Park, 2021). Research (Keuangan et al., 2024) proves that FoMO has a significant impact on consumptive behavior. This is reinforced by (Mahena, Sofiah, & Arifiana, 2025) which states that FoMO encourages irregularity in personal financial management. These findings strengthen the argument that FoMO can interfere with Personal financial planning, so the hypothesis is formulated: H2: Fear of missing out has a significant effect on Personal financial planning in Generation Z.

Self-control is the ability to resist momentary urges in order to achieve long-term goals. In the financial context, individuals with high self-control tend to be able to manage budgets, delay consumption, and set financial priorities more wisely (Jennifer & Pamungkas, 2021).
Research by (Park, 2021) shows that self-control is positively correlated with saving habits and expense management. (Jennifer & Pamungkas, 2021) also found that self-control plays an important role in financial management, although not many have examined its direct effect on Personal financial planning. Based on this theoretical study, the proposed hypotheses are: H3: Self-control has a significant effect on Personal financial planning in Generation Z.

Based on the three theoretical studies and previous studies above, this study proposes a conceptual model that examines the partial and simultaneous effects of Love of money, Fear of missing out, and self-control on Personal financial planning. Simultaneous hypothesis: H4: Love of money, Fear of missing out, and self-control simultaneously have a significant effect on Personal financial planning in Generation Z. Thus, this study contributes to the development of behavioral finance, especially in the context of the digital generation in Indonesia and encourages the development of financial literacy strategies that consider the psychological aspects of individuals.

Personal financial planning in Indonesia is becoming increasingly important as people realize the importance of good financial management to achieve financial stability and prepare for a better future. Some of the factors that encourage Indonesians to do Personal financial planning include the increasing cost of living, the various types of credit and loans available, and the increasing complexity of investment products. Personal financial planning has an important role as a survival requirement that must be fulfilled by all individuals, including Generation Z. This is because generation Z usually has a high tendency to be consumptive in their daily lives. As a result, generation Z is less accustomed to saving, investing, buying insurance, and budgeting for unexpected expenses beforehand, which makes Personal financial planning very important for generation Z (Bado, Hasan, Tahir, & Hasbiah, 2023).

Previous research has discussed many factors that influence financial behavior, such as financial literacy (Putri, Nurwati, & Mahrita, 2023) materialistic attitudes, or self-control (Wahyuni, 2024) However, most previous studies have only examined one or two factors, for example, the effect of financial literacy on saving behavior. More focused on consumptive or investment behavior, not on comprehensive financial planning (T. S. Anggraini et al., 2025) Found that self-control has a positive relationship with financial behavior but has not been tested directly on long-term financial planning.

2. Methodology

This research was conducted in Medan City, North Sumatra Province, with the object of research being individuals who belong to the Generation Z group (aged 18-27 years).
The research was conducted for four months, from March to June 2025. The type of data used is quantitative data, which is data in the form of numbers and can be measured statistically. This data was obtained through the results of distributing questionnaires to Generation Z respondents. In this study, the data collection techniques used were primary data collection and secondary data. Primary data, namely data obtained directly from respondents through questionnaire instruments and secondary data, is used to support and complement primary data, such as theories from journals, books, and other relevant academic sources. The sampling technique used is purposive sampling, which is a sampling technique based on certain criteria or objectives that are in accordance with the research needs. This technique was chosen so that the data obtained was relevant to the variables studied. The purposive sampling technique was used to obtain 150 respondents. The sample in this study is part of the Generation Z population in Medan City who meet the criteria, namely: Aged between 18-27 years old, domiciled in Medan City and Willing to be a respondent and fill out a questionnaire honestly. The questionnaire consists of 30 statement items related to Love of money (10), Fear of missing out (8), self-control (5), and Personal financial planning (7). The research instrument used a questionnaire with a 5-point Likert scale, namely: 1= Strongly Disagree, 2= Disagree, 3= Neutral, 4= Agree, and 5= Strongly Agree.

In this study, data analysis was carried out quantitatively using multiple linear regression analysis to determine the effect of the variables Love of money, Fear of missing out (FoMO), and Self-Control on Personal financial planning in Generation Z. The stages of data analysis are Descriptive Analysis. The stages of data analysis are Descriptive Analysis, Validity and Reliability Test, Normality Test, Multicollinearity Test, Heteroscedasticity Test, Multiple Linear Regression Analysis, t-test (partial, F test (simultaneous), and Coefficient of Determination (R^2) test.

3. Results and Discussion

In this section, the demographic characteristics of respondents, consisting of gender, age, and employment status, are described. The purpose of presenting this profile is to provide an overview of the background of the respondents involved in the study. Data collection in this study was conducted online using a Google Form questionnaire distributed through the

WhatsApp application to various contacts and groups consisting of students, alumni, and the Generation Z community in Medan city. The distribution was carried out for approximately one month, with a total of around 250 questionnaire links distributed. Of these, 164 responses were collected, but after filtering based on completeness and suitability of criteria, only 150 questionnaires were declared valid and suitable for analysis. The questionnaire included demographic data as well as statements measuring the variables of Love of money, Fear of missing out, Self-Control, and Personal financial planning. The use of online methods proved to be effective and efficient in reaching respondents, so as to produce representative data in accordance with the research objectives.

Table 1. Description of respondents

	Frequency	Percent
Gender		
Male	65	43,4%
Female	85	56,7%
Total	150	100
Respondents' age		
<18 Years	3	2
18 – 22 Years	88	58,7
22 -27 Years	59	39,3
Total	150	100
Employment status		
Student/ College student	101	67,3
Employed	47	31,3
Others	2	1,4
Total	150	100

Based on the results of the study, it is known that out of a total of 150 respondents, 65 people (43.4%) were male and 85 people (56.7%) were female. In terms of age, there were 3 respondents under 18 years old (2%), 86 people (58.7%) aged 18-22 years old, and 57 people (39%) aged 22-27 years old. Meanwhile, based on activity background, the majority of respondents are students or college students, as many as 101 people, followed by respondents who have worked, as many as 47 people, and the remaining 2 people fall into other categories.

According to (Loindong, Tewal, & Sendow, 2023) validity is used to determine whether the questionnaire items are relevant and able to reflect the variable concept as a whole. If the item is invalid, then the interpretation of the research results can be misleading. "The validity test in this study was carried out using Pearson Product Moment correlation, with a significance of <0.05 as explained by (F. D. P. Anggraini, Aprianti, Setyawati, & Hartanto, 2022) If r count> r table and p-value <0.05, then the item is considered valid.
The validity test was carried out using the Pearson Product Moment correlation to assess whether each item of the research instrument accurately measured the intended construct. With a significance level of α = 0.05 and a critical r value of 0.1603 (N = 150), the results are as follows:

Table 2. Love of money validity test results

Variable	Statement Items	Correlation Coefficient (r)	Sig	Description
X1 (Love of money)	1	0,67	0	Valid
	2	0,63	0	Valid
	3	0,60	0	Valid

	4	0,79	0	Valid
	5	0,61	0	Valid
	6	0,69	0	Valid
	7	0,80	0	Valid
	8	0,83	0	Valid
	9	0,84	0	Valid
	10	0,81	0	Valid

Based on the results of the analysis in Table 2, all statement items on the Love of money variable are declared valid because the correlation coefficient value of each item> r-table value (r-table for N = 150 and α = 0.05 (df = 148) ≈ 0.1603) and the significance level is below 0.05. Thus, the ten indicators of Love of money are feasible to use for the next stage of analysis.

Table 3. Fear of missing out validity test results

Variable	Statement Items	Correlation Coefficient (r)	Sig	Description
X2 (Fear of missing out)	1	0,87	0	Valid
	2	0,82	0	Valid
	3	0,88	0	Valid
	4	0,89	0	Valid
	5	0,86	0	Valid
	6	0,78	0	Valid
	7	0,71	0	Valid
	8	0,83	0	Valid

Based on the results of Table 3, all statement items on the Fear of missing out variable are declared valid because the correlation coefficient value of each item> r-table value (r-table for N = 150 and α = 0.05 (df = 148) ≈ 0.1603) and the significance level is below 0.05. Thus, the eight fear-of-missing-out indicators are suitable for the next stage of analysis.

Table 4. Self-control validity test results

Variable	Statement Items	Correlation Coefficient (r)	Sig	Description
X3(Self-control)	1	0,82	0	Valid
	2	0,85	0	Valid
	3	0,65	0	Valid
	4	0,88	0	Valid
	5	0,87	0	Valid

Based on Table 4, all statement items on the self-control variable are declared valid because the correlation coefficient value of each item> r-table value (r-table for N = 150 and α = 0.05 (df = 148) ≈ 0.1603) and the significance level is below 0.05. Thus, the five indicators of self-control are suitable for the next stage of analysis.

Table 5. Personal financial planning validity test results

Statement Items	Correlation Coefficient (r)	Sig	Description
1	0,83	0	Valid
2	0,77	0	Valid
3	0,88	0	Valid
4	0,78	0	Valid
5	0,82	0	Valid
6	0,88	0	Valid
7	0,76	0	Valid

Based on Table 5, all statement items on the Personal financial planning variable are declared valid because the correlation coefficient value of each item> r-table value (r-table for N = 150

and α = 0.05 (df = 148) ≈ 0.1603) and the significance level is below 0.05. Thus, the seven Personal financial planning indicators are suitable for the next stage of analysis.

Reliability testing is conducted to assess how consistently a measurement instrument produces the same results when applied repeatedly to the same subject. An instrument is considered reliable if the Cronbach's Alpha value is equal to or greater than 0.70.

Table 6. Reliability test results

No	Variable	Cronbach's Alpha	Description
1	Love of money (X1)	0,90	Reliable
2	Fear of missing out (X2)	0,93	Reliable
3	Self-control (X3)	0,86	Reliable
4	Personal financial planning	0,91	Reliable

Based on the reliability test results presented in Table 6, all variables in this study have Cronbach's Alpha values of ≥ 0.70, indicating that all measurement instruments are considered reliable. The Cronbach's Alpha values for each variable are as follows: Love of money at 0.90, Fear of missing out at 0.93, Self-Control at 0.86, and Personal financial planning at 0.91. These results show that each instrument has a very high level of internal consistency and is suitable for use in this research.

The normality test is conducted to determine whether the residuals in the regression model follow a normal distribution. Non-normality in the data may result in invalid and inaccurate parametric analysis. In this study, normality testing was carried out using the Kolmogorov-Smirnov and Shapiro-Wilk approaches. The Kolmogorov-Smirnov test measures the difference between the cumulative distribution of the observed data and the theoretical normal distribution, while the Shapiro-Wilk test is more responsive for small to medium-sized samples. According to (Monter-Pozos & González-Estrada, 2024), the data is considered normally distributed if the significance value (p-value) is greater than 0.05, and conversely, considered non-normal if the value is 0.05 or less.(Monter-Pozos & González-Estrada, 2024),

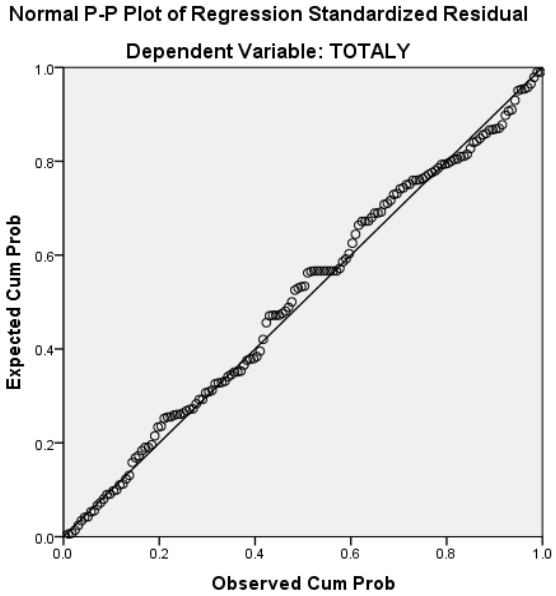

Fig. 1. Q-Q plot results

Because the significance value (0.200) is greater than 0.05, the residual data is normally distributed. A Q-Q Plot, which shows a point distribution pattern that follows the diagonal line. So, it can be concluded that the normality assumption is met, and the data are suitable for further regression analysis. The multicollinearity test aims to determine whether there is a high correlation between the independent variables in the regression model. Testing is done by

looking at the Variance Inflation Factor (VIF) and Tolerance values. If the VIF value < 10 and Tolerance > 0.1, then there is no multicollinearity. This test is important to ensure that the regression model provides valid and reliable results.

Table 7. Multicollinearity test

Model	Tolerance	VIF
Total X1 (Love of money)	.746	1.340
Total X2 (Fear of missing out)	.847	1.181
Total X3 (Self-control)	.857	1.167

The multicollinearity test results show that all independent variables do not experience multicollinearity, because:

- Love of money has a Tolerance of 0.746 > 0.10 and VIF 1.340 < 10.
- Fear of missing out has a Tolerance of 0.847> 0.10 and VIF 1.181 < 10.
- Self-Control has a Tolerance of 0.857 > 0.10 and VIF 1.167 < 10.

All values meet the criteria, so the regression model is free from multicollinearity.

The heteroscedasticity test is one of the tests in regression analysis used to detect whether the variance of the residuals or errors of the regression model is constant (homoscedasticity) or not (heteroscedasticity). The heteroscedasticity test aims to ensure that the variance of the residuals in the regression model is constant (homoscedasticity). One of the ways used is by looking at the pattern on the scatterplot graph. If the points on the graph spread randomly and do not form a certain pattern, it can be concluded that there is no heteroscedasticity.

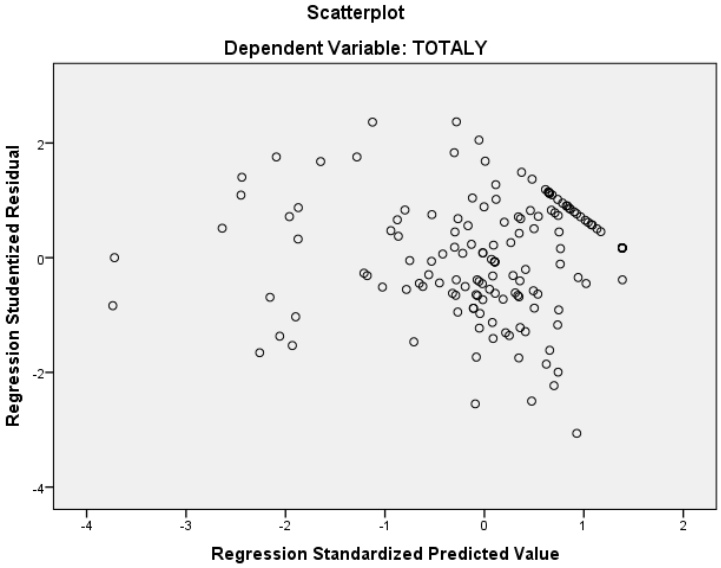

Fig. 2. Scatterplot graph

It can be seen from the scatter plot graph above that the dots appear to spread quite randomly and do not form a special pattern (no clear funnel pattern or conical pattern). Thus, there are no symptoms of heteroscedasticity.

Multiple linear regression analysis is used to test the extent to which Love of money (X_1), Fear of missing out (X_2), and self-control (X_3) affect Personal financial planning (Y).

Table 8. Multiple linear regression analysis

Model	B	Std.Error	Beta	t	Sig
Constant	3.768	1.892		1.992	.048
Love of money	-.010	.047	-.012	-.208	.835
Fear of missing out	.136	.039	.191	3.493	.001
Self-control	1.026	.075	.745	13.711	.000

Based on the results of multiple linear regression analysis, the regression equation is obtained as follows:

$$Y = a + b_1X_1 + b_2X_2 + b_3X_3+e \quad (1)$$

Where:

a = constant
Y = Personal financial planning
X_1 = Love of money
X_2 = Fear of missing out (FOMO)
X_3 = Self-Control
e = error term

By replacing the coefficient values in the model, the regression equation becomes:

$$Y = 3.768 - 0.010X_1 + 0.136X_2 + 1.026X_3+e \quad (2)$$

Interpretation of results:

- The Love of money variable (X_1) has a regression coefficient of -0.010 with a significance value of 0.835 (> 0.05), so it has no significant effect on Personal financial planning (Y).
- The Fear of missing out variable (X_2) has a coefficient of 0.136 with a significance of 0.001 (<0.05), showing a positive and significant effect on Y.
- The Self-Control variable (X_3) shows a coefficient of 1.026 with a significance of 0.000 (<0.05), which means it has a positive and significant influence on Y.

Thus, it can be concluded that in this model, only the variables Fear of missing out and Self-Control significantly influence Personal financial planning, while Love of money does not have a significant effect.

The t (partial) test is one of the statistical methods used in regression analysis to test whether each independent variable (predictor) has a significant effect individually on the dependent variable, assuming other independent variables are considered constant. According to Ghozali (2021), the partial t-test is used to test the significance of the individual effect of the independent variable on the dependent variable in the multiple linear regression model. This test is done by comparing the calculated t value with the t table or by looking at the p-value (Sig.) compared to the significance level (usually α = 0.05). If the p-value < α, then the independent variable has a significant effect.

Table 9. Results of t-test (partial)

Coefficients[a]		
Model	t	Sig
(Constant)	1.992	.048
TOTALX1	-.208	.835
TOTALX2	3.493	.001
TOTALX3	13.711	.000

Test t (Partial regression coefficient):

- H1: The significance value of X1 is 0.835 (> 0.05) and t count -0.208 (< 1.976), then H1 is rejected → X1 has no effect on Y. The results of this study indicate that the Love of money variable has no significant effect on Personal financial planning in Generation

Z in Medan City. This shows that orientation towards money does not necessarily translate into planned financial behavior. This finding is in line with a study conducted by oleh (Khoirunnisa & Purnamasari, 2024) which found that in the K-pop fan community, Love of money has no significant effect on financial management behavior. This is attributed to the dominance of consumptive values and the pressure of popular culture, which encourages individuals to spend money for social status rather than for long-term financial goals. In the context of Generation Z, money is often seen as a symbol of lifestyle and social achievement, rather than a tool for rational financial planning. As explained by (Przybylski, Murayama, DeHaan, & Gladwell, 2020) Love of money may strengthen extrinsic motivation, but it is not necessarily aligned with healthy financial planning habits. Therefore, even though someone has a high love for money, it does not guarantee good financial planning behavior, because this orientation may be driven more by the need for self-actualization or the influence of the social environment rather than mature financial considerations.

- H2: The significance value of X2 is 0.001 (<0.05) and t count 3.493 (> 1.976), then H2 is accepted → X2 has a significant effect on Y.
- H3: The significance value of X3 is 0.000 (<0.05) and t count 13.711 (> 1.976), then H3 is accepted → X3 has a significant effect on Y.

The simultaneous test is a method used to assess whether all independent variables in a regression model have a significant impact collectively on the dependent variable. The F-test functions to evaluate the overall significance of the regression model, specifically to determine whether the independent variables collectively have a significant effect on the dependent variable. In the context of multiple linear regression, this test helps assess the feasibility of the regression model for forecasting purposes. Additionally, the F-test is also applied in analysis of variance (ANOVA) to identify differences in means among three or more groups, as well as in testing the homogeneity of variances to evaluate whether two or more populations have comparable variances. The decision is based on the significance value (p-value), where a p-value ≤ 0.05 indicates that the test result is considered significant.

Table 10. F test results (simultaneous)

Model	F	Sig
Total	83.055	000

Based on Table 7, it is known that the significant value for the simultaneous influence of x1, x1, and x3 on Y is 0.000 <0.05, and the calculated F value is 83.055> F table 2.67, so it can be concluded that H4 is accepted, which means that there is a simultaneous influence of X1, X2 and X3 on Y.

The Coefficient of Determination (R^2) is a statistical measure used in regression analysis to describe the proportion of variation in the dependent variable (Y) that can be explained by the independent variable (X) in a regression model. The Coefficient of Determination (R^2) plays a role in assessing how much of the variation in the dependent variable can be explained by the independent variable within a given regression model. The R^2 value ranges from 0 to 1, where a value closer to 1 indicates that the model can explain most of the data variation, while a value closer to 0 indicates that the model has very limited ability to explain the dependent variable. Therefore, R^2 provides information on how well the regression model explains the data. However, R^2 cannot determine whether the relationship between variables is causal or statistically significant, thus requiring support from t-tests and F-tests."

Table 11. Coefficient of determination (R2)

Model	R	R Square	Adjusted R Square	Std. Error of the Estimate
1	.794[a]	.631	623	3.69350

Based on the Model Summary output in Table 8, the coefficient of determination (R Square) is 0.631, indicating that 63.1% of the variation in Personal financial planning can be explained by the variables Love of money (X1), Fear of missing out (X2), and Self-Control (X3) simultaneously, while the remaining 36.9% is influenced by other factors outside this research model. The Adjusted R Square value of 0.623 shows that the model remains stable even after being adjusted for the number of predictor variables, and the correlation coefficient (R) of 0.794 indicates a strong relationship between independent and dependent variables. Thus, this regression model has good predictive power in explaining Personal financial planning behavior among Generation Z.

Based on the multiple linear regression analysis, it appears that not all independent variables in this study have a significant impact on Personal financial planning among Generation Z in Medan City. Of the three variables tested individually, two showed a significant impact, while one did not demonstrate a meaningful effect.
First, the Love of money variable does not show a significant influence on Personal financial planning. This is evidenced by the significance value of 0.835, which is far above the 0.05 threshold, and a t-value of -0.208, which is lower than the t-table value of 1.976. This means that an individual's orientation toward money, even if high, does not necessarily lead to systematic financial planning habits. This may be due to the tendency of Generation Z to focus more on fulfilling lifestyle desires and instant gratification rather than long-term wealth accumulation. This finding is in line with Khoirunnisa et al. (2024), who stated that Love of money does not significantly influence financial behavior among K-pop fan communities within Generation Z, as their consumption is more strongly driven by popular culture trends than by intrinsic financial motivation.

Second, the Fear of missing out variable shows a positive and significant influence on Personal financial planning. With a significance value of 0.001 and a t-value of 3.493 (> t-table), this result confirms that FoMO, although often associated with impulsive spending behavior, can actually drive some individuals to become more aware of the importance of managing their finances. The Fear of missing out on social trends or viral lifestyles on social media pushes some respondents to create financial plans in order to keep up socially without compromising their overall financial condition. This suggests that social pressure in the form of FoMO can have an adaptive effect if responded to wisely.

Third, the Self-Control variable has the strongest influence on Personal financial planning. A significance value of 0.000 and a t-value of 13.711 confirm that the higher a person's level of self-control, the better their behavior in planning personal finances. Individuals who can resist impulsive spending, are disciplined in managing expenses, and make rational financial decisions tend to have a more structured financial plan. This finding reinforces the view that self-control is a crucial foundation in forming healthy financial habits, especially among the younger generation living in a highly consumptive environment.

Simultaneously, the results of the F-test indicate that the three independent variables — Love of money, Fear of missing out, and Self-Control — collectively have a significant effect on Personal financial planning. A significance value of 0.000 and an F-value of 83.055, which is higher than the F-table value (2.67), indicate that the model used in this study is valid and can explain the relationship between these variables.
Furthermore, the coefficient of determination (R^2) of 0.631 indicates that 63.1% of the variation in Personal financial planning behavior among Generation Z can be explained by the three independent variables. The remaining 36.9% is influenced by other factors outside the scope of this study, such as financial literacy, family influence, socio-economic status, or access to digital financial products. Thus, the findings of this study highlight the importance of psychological and social aspects in shaping financial behavior among Generation Z. Self-control proves to be the most dominant factor, while Love of money is not a primary determinant in the formation of Personal financial planning among this generation.

4. Conclusion

Based on the research findings and discussion, it can be concluded that Personal financial planning behavior among Generation Z in Medan is influenced by psychological factors such as Fear of missing out and Self-Control, while Love of money does not have a significant effect. Partially, Fear of missing out (FoMO) shows a positive and significant influence on Personal financial planning. This finding indicates that the drive to not fall behind on social trends or peer lifestyles can serve as a motivation for some members of Generation Z to become more aware of the need to plan their finances. Although FoMO is often perceived negatively due to its association with impulsive consumption, in the context of this study, FoMO actually encourages individuals to take more deliberate financial steps in order to remain socially relevant.

Meanwhile, Self-Control proves to be an important factor that positively and significantly affects Personal financial planning. Generation Z individuals who are capable of resisting impulsive urges and making rational financial decisions tend to be more disciplined in budgeting, saving, and preparing for their financial future. On the other hand, Love of money, or an excessive attachment to money, does not significantly influence financial planning behavior. This indicates that even if someone has a strong orientation toward money, it does not necessarily translate into planned or rational financial actions. This may be because a money-oriented mindset is more related to symbolic values rather than practical attitudes toward daily financial management. Simultaneously, the three independent variables in this study are proven to have a significant combined influence on Personal financial planning among Generation Z. This reinforces the understanding that young people's financial behavior is not solely determined by cognitive abilities or financial literacy, but also by complex psychological and social factors. Therefore, efforts to improve the financial behavior of this generation require approaches that not only provide technical education but also strengthen self-control and raise social awareness regarding the influence of digital environments and consumer culture.

Abstract

This study aims to examine the influence of TikTok live streaming and the Preloved trend on purchasing decisions among young consumers, specifically students at College X. The increasing use of TikTok as a shopping platform and the rising popularity of preloved items viewed as cost-effective and environmentally friendly serve as the main background for this research. Preloved products, though second-hand, are still suitable for use and are considered appealing by the younger generation due to their economic value, sustainability, and environmental benefits. A descriptive quantitative approach was utilized, with data gathered through the distribution of questionnaires to 170 respondents using accidental sampling. Multiple linear regression analysis was performed using SPSS to examine both the simultaneous and individual effects of the independent variables on the dependent variable. The results show that both TikTok live streaming (X1) and the Preloved trend (X2) have a positive and significant effect—both partially and simultaneously—on purchasing decisions (Y). The coefficient of determination (R^2) value of 0.583 indicates that 58.3% of the variation in purchasing decisions can be explained by the two independent variables. The findings highlight the significant role of digital platforms and sustainability trends in shaping consumer behavior. Live streaming provides interactive experiences and builds trust, while the Preloved trend attracts consumers with its affordability and environmental consciousness. This study offers valuable insights for entrepreneurs and academics in understanding consumer behavior in the digital era.
Keywords: TikTok live streaming; Preloved trend; Purchase decision.

1. Introduction

Live streaming**,** or real-time broadcasting, is essentially a form of media convergence derived from traditional broadcasting platforms such as television, but accessible via mobile devices, aligning with the lifestyle of today's internet users. The convenience offered by live streaming has made it a popular medium for storytelling. Unlike pre-recorded videos or photos, which often undergo an editing process, live streaming involves no such process (Patricia et al., 2024). In the current digital era, consumer shopping behavior, particularly among younger generations, has undergone significant changes, driven in part by the emergence of platforms like TikTok that feature live streaming and support the preloved (second-hand) product trend. This phenomenon raises questions regarding the impact of such elements on the shopping choices of young consumers.

Online shopping transactions in Indonesia are projected to reach IDR 487 trillion this year, up from IDR 453 trillion in 2023. Live streaming has emerged as a key feature in boosting sales. According to the Ministry of Trade, the number of online shopping platform users is expected to rise by 11.9%, from 58.63 million in 2023 to 65.65 million in 2024. Based on data from Statistics Indonesia (BPS), 37.79% of micro, small and medium enterprises (MSMEs) in the country are engaged in online commerce (Yoga et al., 2025).
One of the platforms frequently used by the public for shopping, in addition to Shopee and Lazada, is Tokopedia. Tokopedia has established a partnership with TikTok. In recent times,

TikTok has become one of the most popular platforms, particularly among younger generations. According to a report by We Are Social and Meltwater, the number of TikTok users worldwide reached 1.58 billion in 2024, with the majority of users falling within the 18 - 34 age range. The latest data from DataReportal also shows that Indonesia has the largest number of TikTok users in the world, reaching 157.6 million, surpassing the United States with 120.5 million users (Setyowati, 2024). The widespread use of mobile phones drives the high number of TikTok users in Indonesia. TikTok also offers a live streaming feature that has gained popularity among users and business actors. Through live streaming, sellers can interact directly with their audience, showcase products, and answer questions in real time. This interaction creates a more personalized and engaging shopping experience, which can enhance consumer engagement and strengthen purchase decisions. Additionally, TikTok is frequently used to sell secondhand or "preloved" items.

Preloved items refer to products that have been purchased and used only briefly, sometimes never used at all, or received as gifts but never worn pakai (Fernandi, 2024). The trend of purchasing preloved or high-quality secondhand goods has significantly increased. The term "preloved" is often used by young people to replace the word "secondhand" in order to make it sound more appealing and trendier. Although preloved goods are technically secondhand, if they are branded and refurbished to look like new, they can be resold at a highly profitable price (Robot et al., 2024).

TikTok live streaming and the Preloved trend present distinct opportunities for businesses to promote their products. In this context, there is a growing need to understand how live streaming influences consumer perceptions of preloved products. Live streaming represents a significant advancement in media by facilitating real-time interaction (Robot et al., 2024).
The importance of this research lies in the increasing use of digital platforms for shopping activities and the limited understanding of the impact of TikTok live streaming and the Preloved trend on consumer purchasing decisions, particularly among students at College X. This makes College X an ideal site to examine the interaction between social media and consumer behavior. The novelty of this study lies in its specific focus on the influence of TikTok live streaming and the Preloved trend in a context that remains underexplored. While customers may be more inclined to purchase products through live interactions, there is a gap in the literature on how these factors influence buying behavior in local contexts. Therefore, this study seeks to provide deeper insight and offer practical recommendations for sellers not yet using TikTok—particularly live streaming—as a sales strategy.

Several previous studies are relevant to this research. For example, a study titled The Influence of Live Streaming and Lifestyle on the Purchase Intention of Secondhand Clothing at Story Manado found that, based on simultaneous testing, both live streaming and lifestyle had a positive and significant influence on purchase intention. Partial testing showed that both variables individually had a positive and significant impact as well (Robot et al., 2024). Another study *titled* The Influence of Live Streaming, Price, and TikTok Shop Promotions on the Purchase Intention of Preloved Products Among Generation Z in Bengkulu found that the promotion variable (X3) had a t-value of 3.700 > t-table of 1.672 and a significance value of 0.000 < 0.05, leading to the acceptance of Ha and rejection of H0. This indicates that promotion has a positive and significant influence on the purchase intention of Generation Z consumers in Bengkulu (Habibullah et al., 2025).

In addition, a journal study titled *The Impact of TikTok live streaming on Purchasing Decisions* showed that TikTok live streaming, both directly and through the mediating variable of purchase intention, has a significant and beneficial effect on consumer purchasing decisions. This study also confirms the strategic role of live streaming as an effective digital marketing tool to increase customer engagement. However, aside from real-time interaction, other factors also influence the relationship between live streaming and purchasing decisions,

including product quality, trust in the host, and the responsiveness of the host to customer inquiries (Yoga et al., 2025).

TikTok's live streaming feature enables direct interaction between sellers and buyers, creating a more immersive and engaging shopping experience. On the other hand, the trend of secondhand goods, which emphasizes sustainability and economic value, also attracts younger consumers. These individuals not only seek affordable products but also aim to contribute to waste reduction and reduce overconsumption. Although there is still limited research on the impact of secondhand product trends on purchasing decisions, the growing popularity of the preloved market indicates a shift in consumer preferences toward greater environmental awareness. The combination of live streaming and the secondhand trend represents a new transformation in the shopping behavior of younger generations. This knowledge can help businesses design more effective marketing strategies that align with the values held by today's youth. Based on the discussion above, the author is interested in conducting a study titled "The Influence of TikTok live streaming and the Preloved trend on Purchasing Decisions Among Young Consumers."

2. Methodology

This research was conducted at College X, located in the city of Medan. The study employed a quantitative research approach. "Quantitative research methodology is essentially a scientific way of thinking used to acquire knowledge" (Suryadi et al., 2019). The population of this study consisted of students from the 2021 and 2022 cohorts. The 2021 cohort included 111 students, while the 2022 cohort included 183 students, resulting in a total population of 294 students.

The sampling technique used in this study was non-probability sampling, in which not all individuals or elements in the population have an equal chance of being selected as a sample. Specifically, the method applied was accidental sampling**,** which involves selecting respondents who happen to be encountered or are conveniently available at the time of data collection.

$$n = \frac{N}{N \,.\, e\text{^}2+1} \quad (1)$$

Explanation:

n = Number of samples to be determined
N = Population size
e = Margin of error (error tolerance)

The sample size consisted of 170 respondents; the questionnaires were distributed to 170 students from College X Medan, comprising the 2021 and 2022 cohorts. In this study, the data collection technique employed was the questionnaire. A questionnaire is a method of gathering information by providing a list of questions to research respondents. The data obtained in this study were collected directly through the completion of questionnaires by the respondents. Questionnaires were distributed to 170 respondents using an accidental sampling technique. Data analysis was carried out using multiple linear regression with the SPSS software to examine both the simultaneous and partial effects of the independent variables on the dependent variable. The results of the multiple linear regression analysis indicated that the variables of TikTok live streaming (X1) and the Preloved trend (X2) have a positive and significant influence, both partially and simultaneously, on purchasing decisions (Y).

3. Results and Discussion

Respondent characteristics refer to the identity of the respondents who constitute the research sample. The research sample consisted of 170 students who completed the questionnaire.

The respondents' characteristics are presented by age, gender, and highest level of education. The data on respondent characteristics are provided as follows.

Table 1. Respondent characteristics based on gender

No	Gender	Frequency
1	Male	30
2	Female	140
Total		170

From the table above, it is evident that the number of female respondents exceeds that of male respondents. This is because the 2021 and 2022 student cohorts at College X consist of a higher proportion of female students compared to male students.

Table 2. Respondent characteristics based on age

No	Age Group	Frequency
1	16 – 20 years	23
2	21 – 25 years	147
Total		170

From the table above, it can be seen that the number of student respondents aged 16–20 years is greater than the number of respondents aged 21–25 years. This is because the majority of students from the 2021 and 2022 cohorts fall within the 16–20 age range.

Table 3. Respondent characteristics based on the highest education level

No	Age	Frequency
1	MA	10
2	SMA	119
3	SMK	41
Total		170

From the table above, it can be observed that the majority of student respondents have a High School (SMA) education background, compared to those with a Madrasah Aliyah (MA) or Vocational High School (SMK) education. This is also influenced by the fact that most students from the 2021 and 2022 cohorts at College X graduated from SMA rather than MA or SMK.

This study was conducted to analyze the influence of TikTok live streaming and the Preloved trend on the purchasing decisions of students at College X. Data were collected through the distribution of questionnaires to 170 respondents. Data analysis was performed using multiple linear regression tests, including partial tests (t-test), simultaneous tests (F-test), and the coefficient of determination test (R^2).

The validity test is used to assess the accuracy of the instruments employed in the research. An instrument is considered valid if the calculated r-value is greater than the critical r-value. The validity results of each research instrument are as follows:

Table 4. Instrument validity of the TikTok live streaming variable (X1)

Instrument	Validity Value		Description
	Calculated r	r table value	
TikTok live streaming1	0,708		Valid
TikTok live streaming2	0,77		Valid
TikTok live streaming3	0,41		Valid
TikTok live streaming4	0,676		Valid
TikTok live streaming5	0,721		Valid
TikTok live streaming6	0,696		Valid
TikTok live streaming7	0,729		Valid
TikTok live streaming8	0,748	0,1506	Valid
TikTok live streaming9	0,782		Valid

TikTok live streaming10	0,739		Valid
TikTok live streaming11	0,755		Valid
TikTok live streaming12	0,789		Valid
TikTok live streaming13	0,666		Valid
TikTok live streaming14	0,766		Valid
TikTok live streaming15	0,642		Valid

Based on the table above, the test results for each item of the TikTok live streaming variable (X1) show a calculated r-value of 0.1506. Therefore, it can be concluded that, overall, the statement items used for the live streaming variable are valid.

Table 5. Instrument validity of the preloved variable (X2)

Instrument	Validity Value		Description
	Calculated r	r table value	
TikTok live streaming1	0,708		Valid
TikTok live streaming2	0,77		Valid
TikTok live streaming3	0,41		Valid
TikTok live streaming4	0,676		Valid
TikTok live streaming5	0,721		Valid
TikTok live streaming6	0,696		Valid
TikTok live streaming7	0,729		Valid
TikTok live streaming8	0,748	0,1506	Valid
TikTok live streaming9	0,782		Valid
TikTok live streaming10	0,739		Valid
TikTok live streaming11	0,755		Valid
TikTok live streaming12	0,789		Valid
TikTok live streaming13	0,666		Valid
TikTok live streaming14	0,766		Valid
TikTok live streaming15	0,642		Valid

Based on the table above, the test results for each item of the Preloved trend variable (X2) show a calculated r-value of 0.1506. Therefore, it can be concluded that, overall, the statement items used for the Preloved trend variable are valid.

Table 6. Instrument validity of the purchase decision variable (Y)

Instrument	Validity Value		Description
	Calculated r	r table value	
TikTok live streaming1	0,708		Valid
TikTok live streaming2	0,77		Valid
TikTok live streaming3	0,41		Valid
TikTok live streaming4	0,676		Valid
TikTok live streaming5	0,721		Valid
TikTok live streaming6	0,696		Valid
TikTok live streaming7	0,729		Valid
TikTok live streaming8	0,748	0,1506	Valid
TikTok live streaming9	0,782		Valid
TikTok live streaming10	0,739		Valid
TikTok live streaming11	0,755		Valid
TikTok live streaming12	0,789		Valid
TikTok live streaming13	0,666		Valid
TikTok live streaming14	0,766		Valid
TikTok live streaming15	0,642		Valid

Based on the table above, the test results for each item of purchase decision variable (Y) show a calculated r-value of 0.1506. Therefore, it can be concluded that, overall, the statement items used for the purchase decision variable are valid. The validity test is used to ensure that the instruments applied are reliable, consistent, and stable when used repeatedly over time. An instrument is considered reliable if the Cronbach's alpha value is greater than the accepted reliability threshold (0.6). The results of the reliability test are presented as follows:

Table 7. Reliability results of the research instrument

No	Variable	Cronbach's Alpha	Description
1	TikTok live streaming (X1)	0,746	Reliabel
2	Preloved trend *(*X2)	0,801	Reliabel
3	Purchase Decision (Y)	0,792	Reliabel

The results of the reliability test show that the Cronbach's Alpha values for all variables are greater than 0.6. Therefore, it can be concluded that the research questionnaire is a reliable instrument. This test was conducted to examine the influence of live streaming and the Preloved trend on purchasing decisions among young consumers at College X in Medan. The following table presents the results of the multiple linear regression analysis for each variable:

Table 8. Results of the multiple linear regression analysis

Model		Unstandardized Coefficients		Standardized Coefficients	t	Sig.	Collinearity Statistics	
		B	Std. Error	Beta			Tolerance	VIF
1	(Constant)	17,021	2,134		7,976	0		
	Live Streaming (X1)	0,33	0,046	0,48	7,213	0	0,563	1,777
	Preloved trend (X2)	0,214	0,04	0,355	5,337	0	0,563	1,777

a. Dependent Variable: Purchase Decision (Y)

Based on the results of the analysis above, the multiple linear regression equation is obtained as follows:

$$Y = 17{,}021 + 0{,}330\ X_1 + 0{,}214X_2 \quad (2)$$

In the multiple linear regression model, the constant value for employee productivity was estimated to be 17.021. This means that when the independent variables (X1 and X2) have a value of zero, the dependent variable (Y) is 17.021. The regression coefficients for each independent variable are positive, indicating that the purchase decisions at College X can be influenced by live streaming and the Preloved trend.

The coefficient of determination aims to measure the extent to which the independent variables explain the variation in the dependent variable. The value of the coefficient of determination is illustrated in the following table.

Table 9. Results of the coefficient of determination test (R^2)

Model Summary				
Model	R	R Square	Adjusted R Square	Std. Error of the Estimate
1	,764[a]	0,583	0,578	3,60919

The coefficient value obtained was 0.583 or 58.3%, indicating that the variables of live streaming and the Preloved trend are able to explain 58.3% of the variation in purchase decisions at College X, while the remaining 41.7% is explained by variables not examined in

this study.

The simultaneous test (F-test) was conducted to examine the simultaneous effect of TikTok live streaming and the Preloved trend on purchase decisions. The test was performed at a 95% confidence level or a significance level of α = 0.05 (5%), with the following criteria:

If the calculated F-value (F_h) ≤ the critical F-value (F_t), then H_0 is accepted and H_1 is rejected, indicating that the variables have no effect on the study simultaneously. Suppose the calculated F-value (F_h) is greater than the critical F-value (F_t). In that case, H_0 is rejected and H_1 is accepted, indicating that the variables have a significant effect on the study simultaneously.

Table 10. Results of the simultaneous test (F-test)

Model		Sum of Squares	df	Mean Square	F	Sig.
1	Regression	3043,198	2	1521,599	116,81	,000[b]
	Residual	2175,39	167	13,026		
	Total	5218,588	169			

Based on the table, it can be observed that the calculated F-value of 116.810 is greater than the critical F-value of 3.05, and the significance value of 0.000 is less than the alpha level of 0.05. Therefore, the decision is to reject H_0 and accept H_1. This indicates that the independent variables, consisting of TikTok live streaming (X_1) and the Preloved trend (X_2), are able to explain the variation in the dependent variable, Purchase Decision (Y). Thus, the variables TikTok live streaming and the Preloved trend simultaneously have a positive and significant effect on purchase decisions at College X. The partial test (t-test) aims to examine the effect of live streaming and the Preloved trend on purchasing decisions, with the following criteria:

If the calculated t-value (t_h) is less than or equal to the t-table value (t_t), then H_0 is accepted and H_1 is rejected, indicating that the variable does not have a partial effect in this study.
If the calculated t-value (t_h) is greater than the critical t-table value (t_t), then H_0 is rejected and H_1 is accepted, indicating that the variable has a significant partial effect in this study.

Table 11. Results of Partial Test (t-test)

Model		Unstandardized Coefficients		Standardized Coefficients	t	Sig.	Collinearity Statistics	
		B	Std. Error	Beta			Tolerance	VIF
1	(Constant)	17,021	2,134		7,976	0		
	Live Streaming (X1)	0,33	0,046	0,48	7,213	0	0,563	1,777
	Preloved trend (X2)	0,214	0,04	0,355	5,337	0	0,563	1,777

Based on the table, the following can be observed:
1. The calculated t-value for the live streaming variable is 7.213, which is greater than the critical t-value of 3.05, and the significance value is 0.000, which is less than the alpha level of 0.05. Therefore, the null hypothesis (H0) is rejected, and the alternative hypothesis (H1) is accepted. This indicates that, partially, the live streaming variable has a positive and significant effect on purchasing decisions.
2. The calculated t-value for the Preloved trend variable is 5.337, which is greater than the critical t-value of 3.05, and the significance value is 0.000, which is less than the alpha level of 0.05. Therefore, the null hypothesis (H0) is rejected, and the alternative hypothesis

(H1) is accepted. Thus, partially, the Preloved trend variable has a positive and significant effect on purchasing decisions.

4. Conclusion

Based on the results and discussions in the previous chapter, the following conclusions can be drawn:

1. TikTok live streaming has a positive and significant influence on purchasing decisions among young students at College X, both simultaneously and partially. This influence indicates that the more active and engaging the TikTok live streaming content is, the greater the likelihood that students will make a purchase decision.
2. The Preloved trend also has a positive and significant effect on purchasing decisions, both partially and simultaneously. This suggests that interest in trending pre-loved items can increase students' desire to purchase certain products.
3. Collectively, TikTok live streaming and the Preloved trend significantly affects purchasing decisions, indicating that these two factors together play an important role in influencing the buying behavior of young consumers.

Managerial Recommendations

1. Optimize TikTok live streaming Strategy: Marketing owners should allocate resources to improve the quality of live streaming content, particularly in terms of audio, visuals, and interaction. Hosts or streamers should be trained to deliver product information in an engaging, honest, and communicative manner.
2. Develop Branding for Preloved Products: Product owners can leverage the Preloved trend by incorporating storytelling or emotional narratives behind the products to attract young customers who value sustainability and uniqueness.
3. Facilitate Easier Transactions: Operations owners should ensure that the purchasing process after live streaming is quick and easy (e.g., instant payments, courier options, and guaranteed timely delivery), so as not to hinder the purchase intention generated during the live session.
4. Regular Trend Analysis and Adaptation: The marketing division should routinely analyze popular Preloved trends and products on TikTok. This enables them to adjust products, promotions, and content in accordance with customers' evolving preferences.

Abstract

This study examines the dynamics of early-stage startups in Indonesia through a systematic literature review (SLR) of global and local research conducted from 2015 to 2025. The objective is to identify the critical success factors, prevailing business models, key challenges, and ecosystem support mechanisms that influence novice entrepreneurs. Guided by the PRISMA methodology, 20 peer-reviewed articles and influential publications were analyzed across themes of founder competencies, digital business models, and entrepreneurial ecosystems. The findings reveal that founder-related capabilities such as prior experience, innovation, and adaptability play a decisive role in startup survival. Externally, incubators, government policies, and access to funding are essential yet remain fragmented in the Indonesian context. Platform-based, subscription, and freemium models dominate the digital startup landscape, offering scalability but also exposing ventures to risks of inadequate product-market fit. Startups in developing nations face greater barriers—including limited capital and weak ecosystem integration—compared to those in advanced economies with robust entrepreneurial infrastructures. This study concludes that startup success depends on aligning internal competencies with external ecosystem support, particularly within Indonesia's evolving digital economy. The research contributes to the development of theory in digital entrepreneurship and provides practical implications for entrepreneurs, policymakers, and ecosystem stakeholders in fostering sustainable startup growth.
Keywords: Digital; Entrepreneurship; Ecosystem.

1. Introduction

Entrepreneurship and startup development have emerged as dominant engines of innovation, job creation, and economic transformation in the digital age. Startups, particularly in their early stages, are viewed as crucial vehicles for translating novel ideas into marketable solutions, driving technological advancement, and creating entirely new industries (Eesley & Roberts, 2012). In an increasingly knowledge-driven economy, the entrepreneurial process has been redefined by rapid technological change, the availability of digital platforms, and the growing interconnectedness of global markets. The rise of digital entrepreneurship is not merely a phenomenon confined to Silicon Valley or other established hubs of innovation but has spread across both developed and developing economies, reshaping how entrepreneurs identify opportunities and mobilize resources (Nambisan, 2017; Giones & Brem, 2017). These dynamics underscore the urgency of understanding how startups emerge, adapt, and survive in volatile and uncertain environments.

Despite their celebrated role in fostering innovation, startups face formidable challenges, particularly during their formative years. Early-stage startups operate under conditions of extreme uncertainty, resource scarcity, and institutional ambiguity, which often result in high failure rates (Aldrich & Fiol, 1994; Shepherd & Gruber, 2020). Founders must not only develop a compelling value proposition but also acquire the skills and resilience required to navigate

rapidly changing market dynamics. The lean startup approach, for example, highlights the necessity of iterative experimentation and entrepreneurial learning as key mechanisms to achieve product-market fit (Blank, 2013; Shepherd & Gruber, 2020). At the same time, digital transformation has lowered barriers to entry in many industries but has also increased competitive intensity, forcing startups to differentiate through innovation and superior execution (Brem & Voigt, 2009). These pressures illustrate that while opportunities for entrepreneurship have expanded in the digital era, the complexity and risks associated with building a successful venture remain significant.

A critical dimension of these challenges lies in the interplay between internal and external factors that influence startup trajectories. On the one hand, founder-level attributes such as entrepreneurial cognition, prior experience, and innovation capabilities strongly shape new venture performance (Eesley & Roberts, 2012; Brem & Voigt, 2009). On the other hand, external factors—such as the presence of supportive incubators, access to venture capital, and conducive institutional frameworks—are equally vital for survival and growth (Clarysse et al., 2014; Mian et al., 2016). Entrepreneurial ecosystems, comprising networks of actors, institutions, and resources, provide legitimacy, knowledge spillovers, and relational support that are often decisive for early-stage ventures (Spigel, 2017; Autio et al., 2018). Yet, research has also highlighted how ecosystems in emerging economies are often fragmented and underdeveloped, lacking the density of resources and institutional support found in advanced economies (Roundy, 2019). This asymmetry raises important questions about how startups in different contexts overcome resource and legitimacy constraints to scale their ventures.

Existing studies provide valuable insights into entrepreneurship, but several research gaps remain. Much of the entrepreneurship literature has historically focused on developed economies, with ecosystems such as Silicon Valley, London, or Berlin serving as dominant case studies (Spigel & Harrison, 2018; Brown & Mason, 2017). Comparatively fewer studies examine how early-stage startups emerge and sustain themselves in less mature ecosystems characterized by institutional voids, limited funding, and cultural barriers toward risk-taking (Zahra & Wright, 2016). Moreover, while theories such as the resource-based view (Barney, 1991), dynamic capabilities (Teece, 2010), and effectuation (Sarasvathy, 2001) offer useful lenses, there remains a need to synthesize these perspectives systematically to understand the interplay of micro-level founder competencies and macro-level ecosystem enablers. This gap is particularly acute in the digital era, where startups rely heavily on platform-based, subscription, and freemium business models that create new forms of scalability but also expose ventures to unique risks (Colombo & Piva, 2020). Thus, a systematic literature review of global evidence can help integrate fragmented insights, address existing gaps, and develop a conceptual framework that is more applicable across contexts.

The purpose of this research is therefore twofold. First, it seeks to systematically review and synthesize the existing literature on early-stage startups, with a specific focus on internal founder-related factors, external ecosystem-related factors, dominant digital business models, and recurring barriers to startup survival. By doing so, the study aims to provide a holistic understanding of what enables or hinders startups in their formative stages. Second, this research endeavors to highlight the differences in entrepreneurial dynamics between advanced and emerging economies, thereby providing nuanced insights into the contextual nature of entrepreneurship. Through this dual focus, the study contributes not only to theory development but also to practical and policy-relevant discussions on how to support startups more effectively in diverse environments.

The significance of this study extends to multiple stakeholders. From an academic perspective, it provides a systematic map of the literature on startup development, integrating theoretical perspectives such as effectuation, dynamic capabilities, and ecosystem theory with empirical findings from global contexts. Practically, the findings offer evidence-based guidance for entrepreneurs and startup teams seeking to understand the key success factors and pitfalls

during the early stages of venture creation. For policymakers, the study provides insights into how to design supportive frameworks and ecosystems—such as incubators, accelerators, and funding mechanisms—that can nurture entrepreneurial activity and enhance survival rates. Collectively, these contributions underscore the importance of aligning individual entrepreneurial capabilities with supportive ecosystem structures to maximize the potential of startups as engines of innovation and economic growth.

Literature evaluations about the evolution of early-stage startups are intrinsically linked to the theoretical framework of entrepreneurship, which provides the scholarly basis for elucidating the emergence, growth, and sustainability of new enterprises within a competitive environment. The Resource-Based View (RBV) is a prominent theory in startup studies that highlights the significance of internal resources as key factors in achieving competitive advantage (Barney, 1991). In the realm of early-stage businesses, the Resource-Based View (RBV) is pertinent as founders frequently face constraints in funding and assets; hence, the capacity to effectively manage limited resources, including knowledge, social networks, and creativity, is crucial for success (Wernerfelt, 1995). Alongside the Resource-Based View, the Dynamic Capabilities hypothesis proposed by (Teece, 2018) holds significant importance in startup research.

Digital economy policy and startups in Indonesia have inadequate product-market fit, exacerbating this. (Teece, 2018) Startups in the digital market require these dynamic capabilities due to the rapid shifts in consumer tastes and technology. Consequently, this hypothesis establishes a crucial basis for elucidating why certain firms can adapt and endure, whereas others succumb to failure. Effectuation Theory, formulated by (Read et al., 2010) is another prominent grand theory that posits novice entrepreneurs typically do not commence with a comprehensive rational plan; instead, they construct their enterprises utilizing available resources, pre-existing networks, and improvisational abilities (Read et al., 2010). This concept is particularly pertinent to nascent firms in Indonesia, where restricted access to capital and formal markets frequently compels founders to employ an ad hoc strategy in business development (Fisher, 2012). Moreover, Institutional Theory is crucial in comprehending the evolution of nascent companies. This theory emphasizes the impact of norms, rules, and culture on organizational behavior (Jakobsen, 2015) In the realm of digital startups, governmental regulatory assistance, the existence of incubators, and fiscal policies can establish legitimacy that enhances business sustainability (Bruton et al., 2010).

Alongside institutional theory, Entrepreneurial Ecosystem Theory has garnered heightened interest in recent literature. This idea emphasizes the significance of an entrepreneurial ecosystem comprising entities such as government, universities, incubators, investors, and communities to facilitate startup expansion (Stam, 2015). Simultaneously, the Business Model Innovation (BMI) theory functions as an essential framework for elucidating how companies might generate new value via business model innovation. This thesis posits that a startup's capacity to innovate its value creation, delivery, and capture mechanisms is crucial for market success (Foss & Saebi, 2017). Early-stage firms frequently utilize business model innovation as a way to address resource limitations and penetrate the market more effectively (Chesbrough, 2010). Moreover, current advancements underscore the significance of Digital Entrepreneurship Theory, which accentuates the pivotal function of digital technology as the foremost catalyst of contemporary entrepreneurship (Nambisan, 2017)This thesis asserts that business opportunities are progressively generated by digital platforms, social media, and data-driven technology. For startup organizations, the capacity to utilize digital technology influences both marketing effectiveness and operational efficiency, as well as access to investors (Autio et al., 2018).

Literature studies suggest that integrating theories can yield a more thorough comprehension. For instance, the Resource-Based View (RBV) elucidates the significance of internal resources, whilst the Entrepreneurial Ecosystem Theory highlights the necessity of external

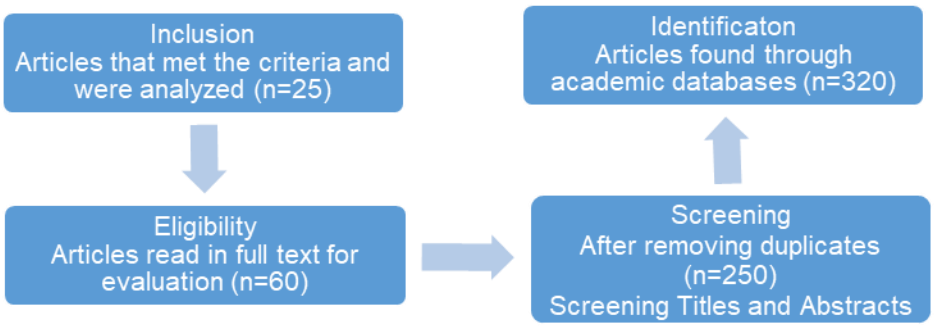
support; when integrated, these frameworks provide a more profound comprehension of how startups can thrive despite constraints (Roundy et al., 2018) The amalgamation of Effectuation Theory and Dynamic Capabilities elucidates how startups engage in short-term improvisation while cultivating long-term adaptive capacity (Read et al., 2010). An examination of contemporary grand theories indicates that the establishment of a startup cannot be elucidated by a singular theory; rather, it necessitates a multi-theoretical framework that incorporates both internal and external elements, along with interactions with digital technology. This review underscores the necessity for systematic research that can cohesively integrate various theories to offer direction for scholars, practitioners, and policymakers. This study seeks to conduct a thorough literature review on startup business growth for novices, emphasizing success factors, difficulties, and suggested techniques. This study will delineate the predominant business models, prevalent challenges, and the influence of the digital ecosystem and external assistance on the success of nascent firms.

2. Methodology

This study employs a Systematic Literature Review (SLR) methodology to examine, locate, and analyze pertinent literature concerning startup business growth for novices. SLR was selected due to its capacity to furnish a thorough review of prior research advancements via a methodical methodology of seeking, choosing, assessing, and synthesizing (Kitchenham, B., & Charters, 2007). This methodology can reduce researcher bias, enhance reliability, and yield findings applicable for both academic and practical usage.

This study adheres to the Preferred Reporting Items for Systematic Reviews and Meta-Analyses (PRISMA) criteria, namely the article selection flowchart, recognized as the international standard for performing systematic literature reviews (SLRs). PRISMA was selected due to its comprehensive framework for each phase of the research, encompassing the formulation of the research question, literature search strategy, criteria for inclusion and exclusion, article selection procedure, and data synthesis stage (Moher et al., 2009). This study is anticipated to exhibit robust methodological transparency by adhering to PRISMA guidelines.

Fig. 1. PRISMA Article selection flowchart



The article selection procedure is depicted in a PRISMA diagram, which details the number of articles identified (see Fig. 1), those excluded at each phase, and the ultimate number of articles examined. The literature search technique involved querying multiple reputable academic databases, specifically Scopus, Web of Science, IEEE Xplore, SpringerLink, and Google Scholar. These databases were chosen due to their extensive array of publications, encompassing esteemed international journals and conference proceedings pertinent to the domain of digital entrepreneurship and startups. The search timeframe was confined to 2015–2025 to guarantee that the literature acquired was contemporary and pertinent to the setting of digital startup growth. The literature search additionally included Indonesian-language publications from SINTA-indexed national journals to enhance the local context. Research

questions (RQs) were developed to direct the literature search and analytical procedure. The inquiries are as follows:

RQ1: What determinants affect the success of nascent startups?
RQ2: Which business models are predominantly employed by early-stage startups?
RQ3: What are the primary obstacles encountered by nascent firms during the foundational phase?
RQ4: Which ecosystem support mechanisms are most successful in promoting the sustainability of early-stage startups?

These research questions facilitate a focused and thematic literature review, ensuring that the findings address pertinent concerns. To guarantee that the acquired literature corresponds with the research objectives, the subsequent inclusion and exclusion criteria were formulated:

Inclusion Criteria: (1) Scientific articles published in peer-reviewed journals; (2) Articles addressing early-stage startups, digital entrepreneurship, or nascent business models; (3) Empirical, conceptual, or literature review studies pertinent to the subject; (4) Articles published from 2015 to 2025; (5) Articles written in English or Indonesian.

Exclusion Criteria: (1) Publications categorized as editorials, comments, or non-scholarly news; (2) Studies concentrating on major firms or well-established startups; (3) Articles exhibiting low methodological rigor (ambiguous data sources or analysis).

Utilizing these criteria, the literature selection process can be streamlined to encompass only pertinent and high-caliber papers.

The article selection procedure was conducted in three phases. Initially, titles and abstracts were screened to exclude items that were evidently irrelevant. Secondly, reviewing the complete content to verify that the articles satisfied the inclusion criteria. Third, quality assessment utilizing a checklist that evaluates the clarity of the approach, the research contribution, and the relevance to the research issue.

This research possesses numerous methodological constraints. Despite the extensive database search, there remains a likelihood that pertinent items were overlooked due to a lack of indexing. The limitation of the publication year to 2015–2025 may omit seminal works that could be pertinent. Third, the emphasis on English and Indonesian literature may neglect significant works in other languages.

Nonetheless, these constraints are expected with a comprehensive search method, explicit inclusion-exclusion criteria, and thorough theme analysis. Thematic synthesis was employed for data analysis, comprising the subsequent steps:

- Preliminary Coding: Recognizing keywords, themes, or significant topics inside each piece.
- Classification: Organizing these themes into overarching categories, including internal variables, external aspects, business models, and ecosystem support.
- Thematic Synthesis: Constructing a narrative that elucidates the interconnections across categories, as well as the similarities and disparities in findings among investigations.

An analysis was performed by juxtaposing research findings from developing nations, such as Indonesia, with those from wealthy nations to discern contextual similarities and contrasts. Consequently, this study offers comprehensive insights while maintaining specificity to the local situation.

The SLR research method can be succinctly delineated as follows: (1) Formulating research inquiries; (2) Crafting a literature search strategy; (3) Executing searches inside databases. (4) Selection based on inclusion and exclusion criteria; (5) Extraction of data from selected publications; (6) Analysis and synthesis of data; Presentation of results in narrative and tabular formats.

The SLR research methodology was created in alignment with worldwide standards, utilizing the PRISMA principles, establishing a robust framework for the literature evaluation on startup development. The research results are anticipated to delineate the principal aspects affecting success, the obstacles encountered, and pertinent solutions for startups through a methodical methodology. This study is anticipated to enhance the development of digital entrepreneurship theory and policy practices in Indonesia.

3. Results and Discussion

The systematic review of twenty peer-reviewed journal articles and influential publications on early-stage entrepreneurship provides a comprehensive picture of the factors shaping startup success and failure. The review first identifies internal factors that directly relate to the competencies and decisions of founders. Across studies, the role of founder characteristics—such as prior entrepreneurial experience, technical knowledge, and managerial skills—emerges as a consistent driver of new venture performance (Eesley & Roberts, 2012). For instance, entrepreneurs with a blend of innate ability and accumulated experience tend to navigate uncertainty more effectively and demonstrate stronger decision-making capacity when evaluating opportunities and managing scarce resources. Lean startup methodologies highlight the importance of entrepreneurial learning and iterative experimentation in this process, positioning experimentation as a mechanism through which founders refine ideas and achieve product-market fit (Blank, 2013; Shepherd & Gruber, 2020). Innovation capabilities are also crucial, as evidenced by Brem and Voigt (2009), who illustrate that balancing technology push with market pull enhances the potential of startups to design scalable solutions that resonate with customers. This internal perspective reinforces that success is not solely a matter of innovative ideas but depends equally on the founder's strategic flexibility, willingness to learn, and capacity to pivot. Taken together, these insights emphasize the centrality of human capital and entrepreneurial cognition in shaping startup trajectories during the formative years.

Beyond the level of individual founders, the review highlights external factors that either enable or constrain entrepreneurial activity. A large body of literature underscores the importance of incubators, accelerators, and entrepreneurial ecosystems as external supports for nascent ventures (Clarysse et al., 2014; Mian et al., 2016). Incubation programs provide mentoring, access to networks, and financial resources that enhance a startup's survival chances, particularly in highly uncertain technological fields. In addition, the development of entrepreneurial ecosystems, characterized by relational networks, cultural attitudes toward risk, and availability of venture capital, plays a pivotal role in shaping entrepreneurial opportunities (Spigel, 2017; Autio et al., 2018). In advanced economies, ecosystems are often digitally enabled and supported by universities, governments, and established firms, facilitating new venture creation through knowledge spillovers and institutional legitimacy. Conversely, emerging economies exhibit fragmented ecosystems, where support is uneven and access to finance remains a structural barrier (Roundy, 2019). These findings align with the argument of Aldrich and Fiol (1994) that new ventures often struggle with legitimacy in institutional contexts that lack established norms for entrepreneurship. The external dimension thus demonstrates how context and ecosystem embeddedness fundamentally shape the resources, legitimacy, and resilience of early-stage startups. Importantly, digital technologies emerge as a transformative external enabler by lowering entry barriers, enabling virtual collaboration, and creating new platform-based business opportunities (von Briel et al., 2018; Giones & Brem, 2017).

An additional finding relates to the predominance of certain business models and recurring barriers to growth. The review shows that platform-based models, subscription models, and freemium approaches dominate the landscape of digital startups (Teece, 2010; Colombo & Piva, 2020). These models offer scalability and revenue predictability, which are attractive in uncertain environments where rapid adoption is crucial. They also fit well with lean startup practices, allowing continuous experimentation and customer feedback loops. However, across contexts, startups face significant barriers such as insufficient capital, lack of managerial expertise, and difficulty in achieving product-market fit (Brown & Mason, 2017; Aldrich & Fiol, 1994). Many founders underestimate the time and resources required to validate their solutions and scale operations, leading to premature scaling or failure. Furthermore, the comparative perspective between developed and developing countries suggests that while startups in advanced ecosystems benefit from dense support networks, those in emerging markets confront persistent institutional voids and regulatory uncertainties. As Zahra and Wright (2016) argue, entrepreneurship is not only an economic act but also a socially embedded phenomenon, meaning that weak institutions, limited investor trust, and cultural attitudes toward failure exacerbate challenges in such contexts. Synthesizing these findings, the analysis suggests that startup outcomes are best understood as the product of interactions between founder-level capabilities, supportive or unsupportive ecosystems, and strategic choices regarding business models. The implication for theory is a call to integrate micro-level insights on entrepreneurial cognition with macro-level perspectives on ecosystems and institutions. For practice, the evidence underscores the need for founders to strategically align their internal strengths with the external resources and constraints of their environment.

The findings of the analysis can be succinctly reported in accordance with the research questions (RQ1–RQ4). Initially, concerning the success determinants of nascent startups (RQ1), the predominant factors include founder competencies, creativity in product innovation, and the capacity to manage internal resources, as elucidated by the Resource-Based View (RBV) and the theory of dynamic capabilities (Wernerfelt, 1995)Secondly, about the prevailing business model (RQ2), numerous nascent firms implement platform-based models owing to their substantial scalability, subscription models for consistent revenue, and freemium models as a tactic to entice initial customers (Chesbrough, 2010; Foss & Saebi, 2017)

Third, regarding the primary hurdles (RQ3), the literature reveals that early-stage companies face significant obstacles, including insufficient finance, inadequate managerial experience, and challenges in achieving product-market fit (Hidayat et al., 2022). The aforementioned issues are the principal factors contributing to the elevated failure rate of startups in Indonesia. Fourth, concerning ecosystem support (RQ4), literature suggests that the functions of incubators, governmental rules, and access to investors are essential; yet a disparity persists between policy and practical requirements on the ground (Putri & Nugroho, 2022; Saragih & Nasution, 2021). Consequently, the findings of this study affirm that establishing a startup necessitates not just unique concepts but also a synthesis of robust internal capabilities, suitable business model tactics, and sufficient external assistance. The practical ramifications of these findings need the enhancement of the digital entrepreneurial environment in Indonesia via expanded incubation programs, inclusive funding regulations, and augmented digital literacy for potential founders. The synthesis of literary data indicates that the dynamics of early-stage startup development are intricately connected to digital entrepreneurship theory, which underscores the significance of invention, technological application, and flexibility in unpredictable contexts. Theory of digital entrepreneurship (Nambisan, 2017) posits that digital technology serves not merely as a business support mechanism but also as a conduit for generating new opportunities via online platforms, application ecosystems, and the integration of big data. This corresponds with study findings indicating that platform-based, subscription, and freemium business models prevail in early-stage startup activities due to their inherent flexibility and rapid scalability.

Effectuation theory (Fisher, 2012; Read et al., 2016) posits that in the initial phases, several businesses depend on accessible resources, social networks, and improvisational strategies rather than strict long-term planning. This literature synthesis indicates that Indonesian entrepreneurs typically include both strategies: utilizing digital technology as a basis for company innovation and employing the flexibility of the effectuation strategy to manage market volatility. The resource-based view theory (Wernerfelt, 2020) and dynamic capabilities theory (Teece, 2018) are pertinent, as they indicate that the success of early-stage startups is primarily influenced by the founders' proficiency in managing internal resources (competencies, experience, creativity) and their ability to swiftly adapt to external changes. The integration of digital entrepreneurship theory with these literary findings underscores that the success of startups is contingent not only on innovative ideas but also on the interplay between internal factors (founder competencies, product innovation, business model) and external factors (ecosystem support, regulations, access to funding).

A comparative review of data in developed and developing nations finds substantial disparities in the difficulties and facilitating factors for startup growth. In developed nations like the United States, the United Kingdom, and Germany, literature suggests that the startup ecosystem is comparatively advanced, characterized by robust venture capital support, innovation-conducive regulations, and established digital infrastructure (Roundy et al., 2018; Spigel & Harrison, 2018). Startups in these nations encounter heightened obstacles in global competition, including the identification of value differences and the preservation of competitive advantage in saturated marketplaces. In contrast, developing nations such as Indonesia, India, and Nigeria face primary challenges including insufficient initial capital, a deficiency of managerial expertise among founders, and limited access to supportive ecosystems like incubators or angel investors (Setiawan et al., 2021; Hidayat et al., 2022). Startups in developing nations frequently do not endure beyond the initial three years due to an inadequate product-market fit, exacerbated by stringent or inconsistent regulatory obstacles (Indrawati et al., 2020; Saragih & Nasution, 2021). Nonetheless, startups in underdeveloped nations have significant improvisational ability, wherein effectuation and bricolage methodologies emerge as essential techniques to navigate resource limitations. This distinction highlights the necessity of comprehending digital entrepreneurship theory within the framework of local ecosystems: in developed nations, the theory focuses on the administration of extensive opportunities, whereas in developing nations, it is more pertinent when associated with how founders can leverage constrained resources and communal support to generate new values.

Literature studies and international comparisons indicate that Indonesia must enhance the integration of its startup ecosystem to diminish failure rates and bolster global competitiveness. At present, Indonesia's digital entrepreneurship ecosystem is disjointed, lacking a cohesive structure that integrates support from incubators, universities, the government, and the business sector (Prasetyo & Sutopo, 2018). University incubators typically have restricted outreach and primarily serve as fundamental training environments, lacking substantial access to investors or markets (Putri & Nugroho, 2022). The government has initiated several strategies, including the National Movement for 1,000 Digital Startups; nevertheless, their execution is impeded by regulations that lack inter-ministerial synchronization (Indrawati et al., 2020). This research underscores the necessity of establishing a cohesive entrepreneurial ecosystem that links incubators, universities, investors, large enterprises, and government agencies into a synergistic network. Universities can function as hubs for cultivating entrepreneurial skills and conducting digital business research; incubators and accelerators can offer mentorship and market access; the government can establish favorable regulations and tax incentives; and the private sector can facilitate collaboration and funding opportunities. An integrated ecosystem will enhance the survival prospects of Indonesian startups and enable them to compete in regional and global markets. The integration of the startup ecosystem will substantially enhance the national digital economy, fostering job creation and sustainable innovation.

4. Conclusion

This study develops a conceptual framework for novice entrepreneurs to establish a startup business, grounded in three primary elements: first, internal factors encompassing founder competence, product innovation, and the selection of an appropriate digital business model; second, external factors including ecosystem support from incubators, access to funding, and government policies favorable to startups; and third, the interaction dynamics between these two factors, expressed through adaptability, improvisation, and continuous learning. This conceptual framework emphasizes that establishing a startup goes beyond relying solely on innovative ideas; it requires a synergy between internal competencies and an external ecosystem that mutually reinforce one another, alongside the founder's ability to discern the convergence of market potential and the solutions provided. According to literature, the predominant business models employed by startup companies, especially in the digital domain, are platform-based, subscription, and freemium models, all of which facilitate the establishment of economies of scale through technological advancements and network-driven market expansion. Nonetheless, the data indicate that early-stage companies frequently encounter significant challenges, including insufficient finance, inadequate managerial expertise, and impediments in achieving product-market fit, resulting in many failing within the initial three years. The significance of digital entrepreneurship theory, effectuation theory, and dynamic capabilities is underscored, highlighting the necessity for founders to exhibit the audacity to utilize available resources, establish strategic networks, and develop sustainable adaptive capabilities, enabling startups to prosper despite uncertainty. Although global literature thoroughly addresses these dimensions, a notable research deficiency persists, especially within the Southeast Asian context, including Indonesia, where the majority of studies concentrate on prominent, successful startups (e.g., Gojek, Tokopedia, Grab). Conversely, investigations into early-stage or nascent startups are scarce, particularly regarding internal team dynamics, survival strategies in the face of resource limitations, and the impact of the local ecosystem on business sustainability. This gap highlights the need for more contextualized research, including comprehensive case studies of early-stage startups across diverse regions, comparative analyses among developing nations in Southeast Asia, or empirical evaluations of the effectiveness of incubation and acceleration programs at universities and governmental institutions. Moreover, subsequent studies may focus on incorporating interdisciplinary viewpoints, such as connecting digital entrepreneurship with public policy, financial technology, or societal changes stemming from the expansion of the digital economy. Additional study is advised to establish an evaluation methodology grounded in sustainability indicators, enabling startups to be assessed not solely on economic growth but also on their contributions to job creation, community empowerment, and inclusive innovation. The findings of this research not only summarize the factors influencing the success of early-stage startups but also present a targeted, comprehensive, and pertinent framework for future research that aligns with the requirements of the digital entrepreneurship ecosystem in Indonesia and the broader Southeast Asian region.

PEMBANGUNAN REALITI TERIMBUH SIRIH WARISAN DALAM PEMULIHARAAN WARISAN ADAT DAN BUDAYA MASYARAKAT MELAYU MENGGUNAKAN *WEBAR WORLD CAST*

Ikhwan Hafizzy Rashid*, Ummu Hani Yusof

Kolej Komuniti Selayang, Persiaran Pegawai, KM16 Jalan Ipoh, 68100 Batu Caves, Selangor, Malaysia.

*Alamat e-mel penulis: ihafizzy05@gmail.com

Abstrak

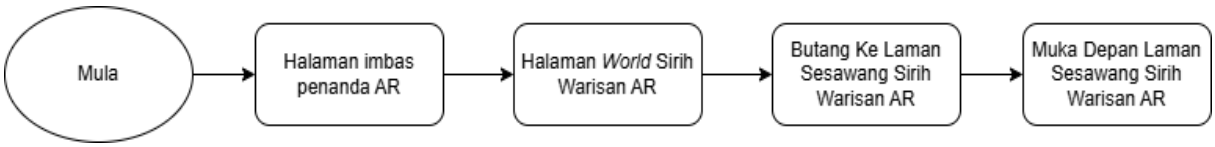
Tepak sirih merupakan simbol penting dalam budaya Melayu yang melambangkan adat, kesopanan dan nilai murni. Namun, penggunaannya kian terpinggir akibat perubahan zaman dan kurangnya kesedaran generasi muda. Kajian ini bertujuan memahami, membangunkan dan menilai keberkesanan teknologi Realiti terimbuh dalam usaha memulihara warisan budaya tepak sirih. Pembangunan projek ini melibatkan model 3D tepak sirih menggunakan perisian 3Ds Max, Substance Painter dan WorldCast. Aset 3D diterbitkan dengan ciri interaktif Realiti terimbuh. Sebanyak 84.4% responden bersetuju aplikasi ini memudahkan pemahaman tentang fungsi dan sejarah tepak sirih, 87.5% menyatakan kandungan maklumat mudah difahami dan tersusun, serta 87.5% bersetuju visual 3D memberi gambaran jelas tentang bentuk sebenar tepak sirih. Penambahbaikan masa hadapan termasuk penambahan elemen Realiti maya bagi memperkukuh pengalaman pengguna dan menarik minat generasi muda terhadap warisan Melayu.
Kata kunci: Tepak sirih; Warisan budaya melayu; Realiti terimbuh.

1. Pengenalan

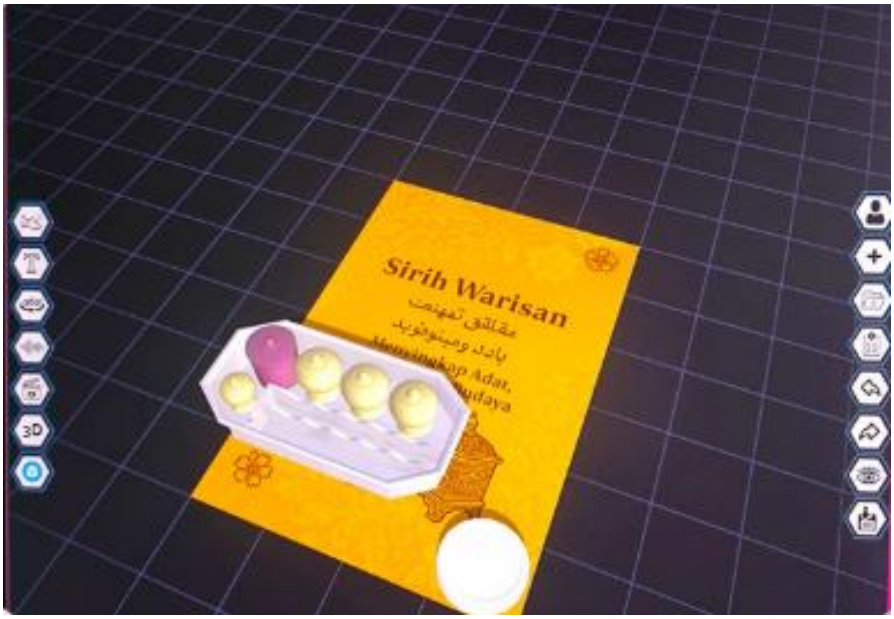
Penggunaan tepak sirih dalam kalangan masyarakat Melayu, khususnya generasi muda, semakin terpinggir dan terbatas kepada majlis rasmi seperti perkahwinan (Norhuda Salleh & Keum Hyunn Rou Kim, 2016). Kemerosotan pemahaman terhadap simbolisme seni ukiran dan fungsi tepak sirih menjadikan warisan ini kian dilupakan. Kajian menunjukkan penggunaannya semakin berkurang, malah di tempat yang masih mengamalkannya seperti di Tanjung Balai, maksud asal tepak sirih tidak lagi difahami (Ade Irma Marpaung, 2018). Kekurangan pelapis muda turut mengancam kelangsungan seni pembuatan tepak sirih (Ayu Nor Azilah Mohamad et al., 2024). Projek ini bertujuan mengenal pasti kaedah penggunaan asal tepak sirih, membangunkan model 3D interaktif, dan menilai keberkesanan aplikasi Sirih Warisan AR dalam meningkatkan pemahaman budaya.

2. Metodologi

Kajian ini menggunakan dua set soal selidik (pra dan pasca penggunaan aplikasi) melibatkan 32 responden berumur 18–25 tahun (87.5%), dengan 71.9% lelaki. Data dikumpul mengenai tahap pengetahuan awal, pengalaman menggunakan aplikasi, dan pandangan tentang keberkesanan AR dalam pembelajaran. Proses pembangunan bermula dengan pengumpulan rujukan visual, lakaran awal, dan pemodelan 3D menggunakan Autodesk 3Ds Max (Rujuk Rajah 1). Tekstur dihasilkan menggunakan Adobe Substance Painter, dan model dimuat naik ke WebAR WorldCast. Sesi *playtest* diadakan untuk menilai visual, kefahaman kandungan, dan tahap interaktiviti.



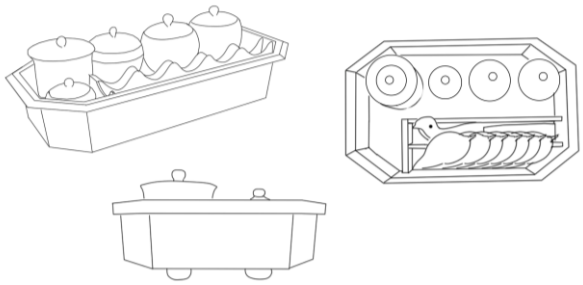
Rajah 1. Carta alir Sirih Warisan AR



Rajah 2. Produk Sirih Warisan AR

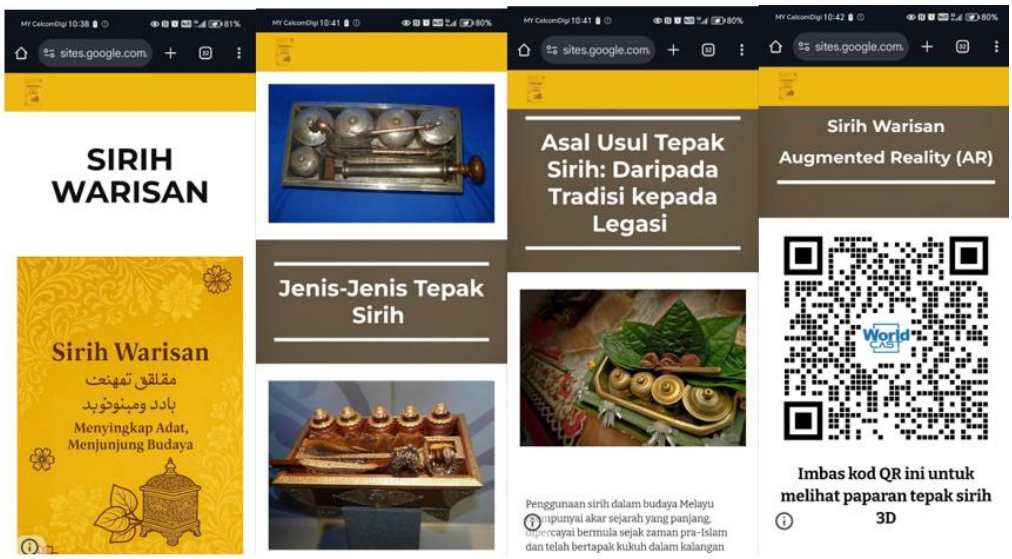
Aplikasi ini dibangunkan menggunakan perisian Autodesk 3Ds Max dan Adobe Substance Painter, dengan bantuan komputer berprestasi tinggi dan pen tablet. Proses pengesahan melibatkan sesi *playtest* bersama pengguna dan semakan oleh pakar. Pembangunan aplikasi ini berpaksikan objektif utama projek, iaitu untuk memahami dan memperkenalkan semula kaedah penggunaan tepak sirih dalam kalangan masyarakat Melayu. Aset visual 3D yang menarik telah diintegrasikan ke dalam platform *WebAR World Cast* bagi meningkatkan minat dan pengetahuan pengguna (Rajah 2). Kaedah

pengumpulan data merangkumi soal selidik, temu bual, dan kajian literatur, manakala keberkesanan aplikasi dinilai melalui sesi *playtest* dan maklum balas pakar.



Rajah 3. Lakaran Model Tepak Sirih

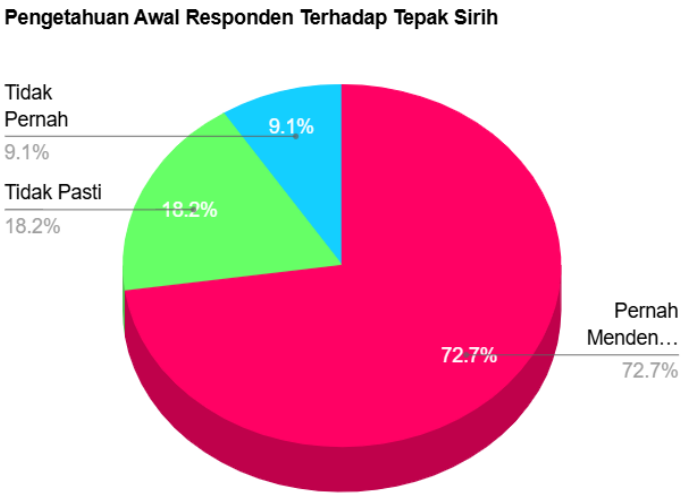
Rajah 3 menunjukkan pandangan atas objek, yang terdiri daripada komponen-komponen utama seperti kacip pinang, cembul, dan bekas sireh. Lakaran 3D tepak sirih ini direka bentuk menggunakan perisian *Adobe Photoshop* bagi menggambarkan bentuk fizikal dari pelbagai sudut pandangan.



Rajah 4. Sumber maklumat tepak sirih warisan
di platform Google Site yang boleh diakses menerusi AR Sirih Warisan

3. Dapatan dan Perbincangan

Kajian ini mendedahkan bahawa tahap pengetahuan awal responden terhadap tepak sirih adalah sederhana dan cenderung kepada pengenalan umum tanpa pemahaman mendalam. Berdasarkan data soal selidik sebelum penggunaan aplikasi Sirih Warisan AR, majoriti responden (72.7%) pernah melihat atau mendengar tentang tepak sirih, manakala 9.1% tidak pernah, dan 18.2% tidak pasti. Walaupun lebih separuh pernah terdedah kepada artifak ini, hanya 45.5% mengetahui fungsinya dalam upacara adat seperti perkahwinan. Sebanyak 27.3% mengetahui bahawa setiap komponen tepak sirih mempunyai maksud simbolik tersendiri, 45.5% tidak mengetahuinya, dan 27.3% hanya pernah mendengar tetapi kurang pasti.



Rajah 5. Dapatan kajian kesedaran masyarakat terhadap tepak sireh

Dapatan ini menunjukkan bahawa walaupun tepak sirih masih wujud dalam kesedaran masyarakat, kefahaman mengenai fungsi dan simbolisme semakin berkurangan. Fenomena ini selari dengan penemuan Norhuda Salleh & Keum Hyunn Rou Kim (2016) yang mendapati penggunaan tepak sirih kini terhad kepada majlis rasmi dan semakin jarang dilihat dalam kehidupan seharian. Ia juga mengesahkan laporan Ade Irma Marpaung (2018) yang menyatakan bahawa masyarakat di Tanjung Balai masih mengamalkan tepak sirih, tetapi maksud asalnya sudah tidak difahami.

Selepas menggunakan aplikasi Sirih Warisan AR, berlaku peningkatan ketara dalam tahap kefahaman responden. Sebanyak 84.4% bersetuju aplikasi ini memudahkan pemahaman tentang fungsi dan sejarah tepak sirih. Sebanyak 87.5% menyatakan kandungan maklumat mudah difahami dan tersusun, manakala 87.5% bersetuju visual 3D memberi gambaran jelas tentang bentuk sebenar tepak sirih. Pengalaman interaktif ini membolehkan pengguna melihat setiap komponen secara lebih terperinci, sekali gus mengatasi keterbatasan media cetak atau gambar statik.

Maklum balas pakar turut mengesahkan bahawa model 3D tepak sirih mempunyai struktur topologi yang baik. Walau bagaimanapun, tekstur kelihatan agak pucat, berkemungkinan disebabkan tetapan eksport atau pencahayaan dalam platform WorldCast. Pakar mencadangkan penambahbaikan pada pencahayaan dan tekstur bagi menghasilkan visual yang lebih realistik. Cadangan ini penting kerana visual berkualiti tinggi mampu meningkatkan minat pengguna untuk meneroka lebih lanjut, seperti disokong oleh kajian Masduki et al. (2021) yang membuktikan bahawa visual yang jelas dan menarik memainkan peranan penting dalam aplikasi AR berasaskan warisan budaya.

Dari sudut keberkesanan pedagogi, dapatan ini membuktikan bahawa penggunaan AR dapat mengatasi isu kekurangan pelapis muda dalam warisan budaya, seperti yang dibangkitkan oleh Ayu Nor Azilah Mohamad et al. (2024). Aplikasi ini bukan sahaja membantu memelihara warisan, malah berpotensi dijadikan medium pendidikan di sekolah atau muzium bagi meningkatkan kesedaran generasi muda. Secara keseluruhannya, Sirih Warisan AR telah memenuhi objektif kajian dengan berkesan, namun ruang untuk penambahbaikan seperti integrasi modul pembelajaran dan sokongan pelbagai bahasa wajar dipertimbangkan untuk kajian seterusnya.

4. Kesimpulan

Kajian ini mencadangkan penambahbaikan aplikasi Sirih Warisan AR seperti penambahan elemen interaktif Virtual Realiti (VR), modul pembelajaran, penglibatan pakar budaya, serta peluasan ke pelbagai platform dan bahasa. Penilaian dan kemaskini berterusan juga disarankan agar aplikasi kekal relevan. Kajian ini terhad oleh saiz sampel kecil yang memfokuskan kepada golongan muda, ciri interaktiviti dan grafik yang terhad, serta keperluan peranti AR. Tempoh kajian yang singkat turut menyukarkan penilaian jangka panjang. Ini menunjukkan keperluan untuk kajian pada masa akan datang yang lebih menyeluruh. Dapat disimpulkan bahawa penggunaan tepak sirih berkurang terutamanya dalam kalangan generasi muda akibat dari kurangnya pemahaman terhadap fungsinya. Pembangunan aset 3D berasaskan teknologi AR telah menawarkan pendekatan interaktif untuk memelihara warisan ini dan wajar diteruskan ke perkakasan atau adat Melayu yang lain. Walaupun berdepan cabaran seperti kekurangan rujukan dan keperluan pengalaman AR yang lancar, teknologi ini berpotensi besar dalam pendidikan dan pemuliharaan budaya, serta memperkenalkan adat Melayu secara moden kepada masyarakat.

Abstrak

Dalam era digital yang pesat berkembang, AI dilihat dapat membantu dalam pembelajaran. Namun sejauh mana sejauh mana pelajar mengambil peluang menggunakan AI dalam aktiviti pembelajaran mereka. Justeru itu, kajian ini dijalankan untuk mengenal pasti kekerapan penggunaan kecerdasan buatan (AI) dan sejauh mana responden bersetuju AI membantu mereka dalam pembelajaran. Sampel yang digunakan dalam kajian ini ialah pelajar Kolej Komuniti Hulu Langat (KKHL). Kajian ini menggunakan pendekatan kuantitatif dalam bentuk tinjauan. Instrumen kajian yang digunakan adalah soal selidik 5-skala likert. Item kajian dibina sendiri berdasarkan peranan AI yang dibincangkan dalam banyak literatur. Data yang diperoleh dianalisis secara deskriptif untuk menentukan tahap persetujuan responden mengenai peranan aplikasi dalam meningkatkan pengalaman pembelajaran. Secara ringkasnya hasil kajian menunjukkan bahawa ramai pelajar menggunakan AI dalam pembelajaran mereka. Di samping itu ramai pelajar bersetuju AI membantu mereka dalam aktiviti pembelajaran. Kajian ini penting untuk memahami bagaimana teknologi AI dapat menyokong aktiviti pembelajaran dan memberikan panduan kepada pendidik dan institusi untuk membantu pelajar menggunakan AI dengan betul dan beretika.
Keywords: Aplikasi AI; Pembelajaran; Pelajar KKHL.

1. Pengenalan

Terdapat banyak kajian yang membincangkan tentang Peranan Aplikasi AI dalam Pembelajaran. Ini menunjukkan bahawa terdapat potensi besar teknologi ini dalam meningkatkan kualiti pendidikan. Kajian-kajian seperti oleh Arifen et al. (2024) menunjukkan bahawa AI mampu mempercepatkan proses pembelajaran dan memudahkan pemahaman konsep yang kompleks. Saroh et al. (2024) menekankan peranan AI dalam mewujudkan pengalaman pembelajaran yang lebih interaktif dan menarik, manakala Nordin et al. (2024) menggariskan kelebihan AI dalam menyediakan akses kepada bahan pembelajaran yang bersesuaian. Selain itu, Qiu et al. (2022) mendapati bahawa AI berkesan dalam membantu pelajar memahami topik yang sukar. Tambahan pula, kajian oleh Alimunir (2023) pula menyatakan bahawa AI membantu pelajar mengurus masa dengan lebih baik melalui penyediaan sumber yang tepat. Abulibdeh et al. (2024) menyimpulkan bahawa AI dapat meningkatkan efisiensi pembelajaran dengan menyelesaikan masalah pembelajaran dengan lebih cepat. Dapatan-dapatan ini memperlihatkan bahawa aplikasi AI menjadi alat penting dalam menyokong dan memperkasa proses pembelajaran moden.

Dalam era digital ini, kecerdasan buatan (AI) semakin diterima dalam pembelajaran. Walaubagaimanapun terdapat kajian membincangkan kesan negatif penggunaan AI kepada pelajar. Salah satu isu utama yang timbul berkaitan penggunaan AI ialah kecenderungan pelajar untuk bergantung kepada teknologi ini. Ini berpotensi untuk mengurangkan kemahiran kognitif asas pelajar. Sebagai contoh, apabila pelajar kerap menggunakan AI untuk menyiapkan tugasan, terdapat risiko bahawa mereka akan menjadi kurang mahir dalam pemikiran kritis dan penyelesaian masalah, yang merupakan kemahiran penting dalam

pendidikan (Maola et al., 2024; Apriliani, 2024). Tambahan pula, penggunaan AI akan menyebabkan interaksi sosial akan berkurangan dalam kalangan pelajar. Ini kerana AI kadangkala menggantikan interaksi bersemuka dalam proses sosial dan pembelajaran. Oleh itu, AI berpotensi membawa kepada peningkatan pengasingan sosial dan menjejaskan keupayaan pelajar untuk bekerjasama dan berkomunikasi secara berkesan dengan rakan sebaya mereka (Tampubolon et al., 2024). Sebagai contoh, satu kajian menunjukkan bahawa pelajar yang kerap menggunakan aplikasi pembelajaran berasaskan AI cenderung mengalami penurunan interaksi sosial berbanding mereka yang belajar secara konvensional; ini menggambarkan kesan negatif teknologi yang jelas dalam konteks sosial (Thamrin et al., 2024). Selain itu, timbul isu berkaitan privasi dan etika. Penggunaan AI dalam pembelajaran biasanya melibatkan pengumpulan data peribadi pelajar, di mana boleh menimbulkan kebimbangan tentang keselamatan maklumat dan potensi penyalahgunaan data (Cahyono et al., 2023; Sahara et al., 2023).

Di samping itu, terdapat juga isu ketidaksamaan dalam akses kepada teknologi AI. Tidak semua pelajar mempunyai akses yang sama kepada teknologi AI, justeru boleh mewujudkan jurang pembelajaran antara mereka yang menggunakan AI dan tanpa AI. Apabila AI digunakan dalam proses pembelajaran, ketidaksamaan dalam keupayaan pembelajaran boleh memburukkan lagi keadaan, di mana pelajar dari latar belakang yang lebih miskin ketinggalan dari segi pengetahuan dan kemahiran teknologi (Tampubolon et al., 2024; Sukatin & Saputra, 2023). Oleh yang demikian. Berdasarkan kepada situasi ini, timbul persoalan Sejauh mana tahap kekerapan penggunaan AI dalam kalangan pelajar? Sejauh mana peranan AI dalam aktiviti pembelajaran pelajar? Justeru itu untuk menjawab persoalan ini, kajian perlu dijalankan untuk mengenal pasti kekerapan penggunaan AI dalam kalangan pelajar dan bagaimana peranan AI dalam meningkatkan pengalaman pembelajaran mereka. Kajian ini penting kerana dengan mengetahui kekerapan penggunaan AI dan peranannya, kajian ini boleh menjadi asas bagi pengurusan kolej dan pensyarah untuk merancang strategi yang lebih berkesan dalam menggunakan AI ke dalam kurikulum bagi meningkatkan hasil pembelajaran.Objektif kajian ini dijalankan untuk:

i. Mengenal pasti kekerapan penggunaan AI dalam kalangan pelajar Kolej Komuniti Hulu Langat
ii. Mengenal pasti peranan Kecerdasan Buatan (AI) dalam Pembelajaran Bagi Pelajar Kolej Komuniti Hulu Langat

Banyak kajian dijalankan menunjukkan bagaimana kecerdasan buatan (AI) memainkan peranan penting dalam pelbagai aspek pembelajaran. Fitri et al. (2024) dan Susanto, E. (2023) mendapati AI digunakan secara meluas oleh pelajar untuk mencari bahan pembelajaran yang relevan. Selain itu, menurut Mizan et al. (2024), AI juga membantu pelajar dalam menyelesaikan tugasan akademik dengan lebih efisien. Noorul et al. (2024) pula menyatakan bahawa AI berperanan dalam memudahkan pemahaman topik-topik yang sukar difahami. Samsudin et al. (2024) menekankan kepentingan AI dalam memberikan cadangan pembelajaran yang bersesuaian dengan keperluan pelajar. Menurut Jalil et al. (2024), penggunaan AI secara harian untuk tujuan pembelajaran semakin menjadi amalan biasa dalam kalangan pelajar, menunjukkan keberkesanan teknologi ini dalam meningkatkan pengalaman pendidikan.
Menurut Arifen et al. (2024), AI dapat mempercepatkan proses pembelajaran dan membantu dalam pemahaman konsep. Saroh et al. (2024) pula menyatakan bahawa AI meningkatkan pengalaman pembelajaran yang lebih interaktif dan menarik. Nordin et al. (2024) menegaskan bahawa AI menyediakan akses yang lebih banyak kepada bahan pembelajaran yang relevan dan diperibadikan. Dalam membantu pelajar memahami topik yang sukar, Qiu et al. (2022) mendapati AI berperanan penting dalam memperbaiki pemahaman pelajar. Selain itu, Alimunir (2023) menyatakan AI membantu mengurus masa dengan lebih baik dengan menyediakan sumber dan bahan yang tepat. Abulibdeh et al. (2024) pula menunjukkan AI

mampu meningkatkan efisiensi pembelajaran dan mempercepatkan penyelesaian masalah pelajar.

2. Metodologi

Kajian ini dijalankan dengan menggunakan pendekatan kuantitatif. Sampel terdiri daripada 100 orang pelajar dari Kolej Komuniti Hulu Langat. Instrumen kajian yang digunakan adalah soal selidik dengan 5 skala Likert, yang dibina sendiri berdasarkan tinjauan literatur seperti yang dibincangkan dalam sorotan kajian. Item kajian telah melalui proses semakan daripada pensyarah yang masih dalam penulisan dan juga telah disahkan oleh Unit Penyelidikan, Inovasi Dan Komersialan (UPIK) di Kolej Komuniti Hulu Langat. Teknik pensampelan yang digunakan adalah secara rawak yang diedarkan secara dalam talian. Dari segi kebolehpercayaan item, nilai cronbach alpha yang diperoleh adalah 0.906. Ini menunjukkan item yang dibina adalah sah dan sesuai untuk digunakan dalam penyelidikan. Teknik analisis yang digunakan adalah analisis deskriptif untuk menentukan tahap berdasarkan nilai min. Nilai skor min akan diterjemahkan kepada tahap seperti yang dicadangkan oleh Ngadiman et al. (2019), iaitu: 1.00–1.99 (Lemah), 2.00–2.99 (Rendah), 3.00–3.99 (Sederhana), dan 4.00–5.00 (Tinggi).

3. Dapatan dan Perbincangan

Responden kajian terdiri daripada 100 orang pelajar daripada 3 program di KKHL yang menjawab soal selidik. Majoriti responden adalah lelaki (65.0%) manakala selebihnya adalah perempuan (35.0%). Dari segi semester, majoriti pelajar berada pada semester pertama (53.0%), diikuti oleh semester kedua (27.0%), dan semester ketiga (20.0%).

Jadual 1. Latar belakang responden

Item	n	%
Jantina	Lelaki	65
	Perempuan	35
Semester	1	53
	2	27
	3	20
Program	Sijil Pengoperasian Perniagaan (SPP)	8
	Sijil Penyejukan dan Penyamanan Udara (SPU)	32
	Sijil Teknologi Maklumat (STM)	60
HPNM	2.00-2.99	2
	3.00-3.33	7
	3.43-3.67	14
	3.68-4.00	25
	Belum ada HPNM (Sem 1)	52

Majoriti responden terdiri daripada pelajar STM (60.0%), manakala pelajar SPU (32.0%) dan seterusnya SPP (8.0%). Kebanyakan responden adalah pelajar semester 1 yang belum mempunyai HPNM (52.0%), pelajar yang memperoleh HPNM 3.68-4.00 (25.0%), yang mempunyai HPNM 3.43-3.67 (14.0%), HPNM 3.00-3.33 (7.0%) dan HPNM 2.00-2.99 (2.0%).

Jadual 2. Ringkasan analisis menggunakan SPSS

No	Item	S.P	Min	Kekerapan
A1	Saya menggunakan aplikasi AI untuk mencari bahan pembelajaran.	1.035	3.40	Sederhana
A2	Saya kerap menggunakan aplikasi AI untuk menyelesaikan tugas.	1.010	3.01	Rendah
A3	Saya menggunakan aplikasi AI untuk memahami topik yang sukar.	1.009	3.46	Sederhana
A4	Saya sering menggunakan aplikasi AI untuk mendapatkan cadangan pembelajaran.	1.064	3.14	Sederhana
A5	Saya menggunakan aplikasi AI setiap hari dalam pembelajaran.	1.019	2.82	Rendah
	Purata	1.027	3.166	Sederhana

Jadual 2 menunjukkan tahap kekerapan penggunaan AI. Secara puratanya, tahap kekerapan penggunaan AI dalam kalangan pelajar berada pada tahap sederhana secara purata (min 3.166). Berdasarkan Jadual 2, tiga item yang memperoleh nilai min tertinggi. Pertama, pelajar menggunakan aplikasi AI untuk memahami topik yang sukar, dengan nilai min 3.46 yang berada pada tahap sederhana. Selain itu, pelajar turut menggunakan aplikasi AI untuk mencari bahan pembelajaran, juga pada tahap sederhana (min 3.40). Seterusnya, pelajar sering menggunakan aplikasi AI untuk mendapatkan cadangan pembelajaran dengan nilai min (3.14). Namun, dari segi menggunakan aplikasi AI setiap hari dalam pembelajaran, tahapnya adalah rendah, dengan min 2.82. Ini menunjukkan bahawa pelajar lebih suka dan kerap menggunakan AI dalam membantu pembelajaran mereka secara keseluruhan. Secara rumusannya, dapatan ini menunjukkan bahawa pelajar menggunakan aplikasi AI dalam pembelajaran, namun tidak secara konsisten atau menyeluruh. Tahap penggunaan yang sederhana ini mungkin menjelaskan bahawa pelajar masih dalam proses menyesuaikan diri dengan teknologi AI, terutamanya pelajar semester awal yang belum sepenuhnya memahami potensi dan kaedah penggunaan AI secara efektif dalam pembelajaran. Banyak faktor-faktor yang boleh mempengaruhi tahap penggunaan ini, seperti tahap pendedahan, kemahiran digital, sikap terhadap teknologi, serta sokongan daripada pensyarah dan institusi.

Jadual 3. Ringkasan analisis menggunakan SPSS

No	Item	S.P	Min	Tahap
B1	Aplikasi AI dapat membantu mempercepatkan proses pembelajaran dan pemahaman konsep.	0.935	3.79	Sederhana
B2	Penggunaan aplikasi AI dalam pembelajaran meningkatkan pengalaman pembelajaran yang lebih interaktif dan menarik.	1.009	3.55	Sederhana
B3	Aplikasi AI memberi pelajar lebih banyak akses kepada bahan pembelajaran yang relevan dan diperibadikan.	0.880	3.71	Sederhana
B4	Aplikasi AI dapat memperbaiki pemahaman saya terhadap topik yang sukar dipelajari.	0.884	3.81	Sederhana
B5	Aplikasi AI dalam pembelajaran membantu pelajar mengurus masa dengan lebih baik dengan menyediakan sumber dan bahan yang tepat pada masa yang sesuai.	0.916	3.70	Sederhana
B6	Aplikasi AI meningkatkan efisien pembelajaran dengan menyediakan penyelesaian cepat untuk masalah yang sering dihadapi pelajar.	0.899	3.80	Sederhana
	Purata	0.920	3.723	Sederhana

Jadual 3 menunjukkan tahap persetujuan peranan Kecerdasan Buatan (AI) dalam pembelajaran bagi pelajar. Secara puratanya, tahap persetujuan peranan Kecerdasan Buatan (AI) dalam pembelajaran bagi pelajar berada pada tahap sederhana secara purata (min 3.723). Berdasarkan Jadual 3, tiga item yang memperoleh nilai min tertinggi. Pertama, Aplikasi

AI dapat memperbaiki pemahaman pelajar terhadap topik yang sukar dipelajari., dengan nilai min 3.81 yang berada pada tahap sederhana. Selain itu, Aplikasi AI meningkatkan efisien pembelajaran dengan menyediakan penyelesaian cepat untuk masalah yang sering dihadapi pelajar, juga pada tahap sederhana (min 3.80). Namun, Penggunaan aplikasi AI dalam pembelajaran meningkatkan pengalaman pembelajaran yang lebih interaktif dan menarik, mempunyai nilai yang paling rendah iaitu 3.55. Ini menunjukkan bahawa pelajar bersetuju dengan peranan AI dalam membantu pembelajaran mereka secara keseluruhan. Tahap sederhana dalam hasil analisis ini merujuk kepada persepsi pelajar terhadap keberkesanan aplikasi AI dalam pembelajaran yang berada pada tahap positif tetapi belum mencapai tahap yang tinggi atau optimum. Dengan min purata 3.723, dapatan ini menunjukkan bahawa pelajar secara umum bersetuju bahawa AI memberi manfaat seperti mempercepatkan proses pembelajaran, meningkatkan interaktiviti, bahan pembelajaran kendiri, serta membantu pemahaman topik sukar. Namun, tahap sederhana ini juga menunjukkan bahawa masih terdapat ruang untuk penambahbaikan, dari segi pendedahan yang lebih luas, latihan penggunaan AI secara berstruktur, atau penggunaan yang lebih sistematik dalam proses pengajaran dan pembelajaran. Tahap sederhana ini boleh dianggap sebagai satu petunjuk awal bahawa pelajar menyedari potensi AI, namun belum sepenuhnya memanfaatkannya secara maksimum.

4. Kesimpulan

Kajian ini mendapati bahawa majoriti pelajar Kolej Komuniti Hulu Langat (KKHL) menggunakan kecerdasan buatan (AI) dalam pembelajaran mereka pada tahap rendah ke sederhana. Bagi penanan AI kepada pelajar, dapatan menunjukkan bahawa tahap persetujuan responden adalah pada tahap sederhana. Secara kesimpulannya dapatan kajian ini menjelaskan bahawa AI memainkan peranan penting dalam meningkatkan pengalaman pembelajaran, termasuk mempercepatkan pemahaman konsep, menjadikan pembelajaran lebih interaktif dan menarik. Selain itu, AI membantu pelajar mengurus masa dengan lebih baik serta meningkatkan kecekapan dalam menyelesaikan tugasan dan memahami topik yang mencabar. Secara rumusannya, dapatan kajian ini menegaskan kepentingan AI dalam pendidikan serta keperluan untuk memanfaatkannya secara lebih strategik. Berdasarkan kepada dapatan kajian ini, kajian ini mencadangkan beberapa strategi boleh dilaksanakan bagi meningkatkan penggunaan AI yang lebih berkesan dalam pembelajaran. Dari sudut amalan pengajaran, pensyarah perlu diberikan latihan profesional untuk mengaplikasikan AI secara efektif dalam aktiviti bilik kuliah, termasuk penggunaan AI untuk pembelajaran adaptif dan penilaian formatif. Dari segi perancangan kurikulum, elemen literasi AI perlu dimasukkan sebagai sebahagian daripada hasil pembelajaran, sama ada melalui kursus khusus atau penggunaan dalam subjek sedia ada. Manakala dari aspek dasar pendidikan, pihak institusi boleh mempertimbangkan untuk membangunkan garis panduan penggunaan AI secara etika dan bertanggungjawab serta menyediakan kemudahan digital yang menyokong pembelajaran berasaskan teknologi. Strategi ini mampu memperkukuh kesediaan pelajar dan pensyarah dalam menghadapi landskap pendidikan yang semakin dipacu oleh kecerdasan buatan.

Abstract

This paper examines the relationship between sustainable practices and technological innovations within the context of Malaysia's environmental policies. The increasing need for advanced technological solutions in addressing environmental issues falls under the purview of policy frameworks at the national level and above, in the age of growing global environmental concern. This study critically examines the evolution of Malaysia's environmental governance mechanisms in adapting to sustainable development guidelines and the emergence of green technologies. The study examines key national policy instruments and stakeholder roles. Results suggest that although sustainability is well-articulated in policy narratives, the translation into practice, particularly through technology-based strategies, is heterogeneous. Several systemic barriers — including fragmented coordination among institutions, regulatory ambiguity, limited resources for innovation, and low public awareness — render policy implementation ineffective. In contrast, opportunities exist for applying digital apps in environmental monitoring, energy-optimized infrastructure systems, and waste elimination technologies. To encourage closer policy alignment between sustainable development goals and technology, the research proposes a framework. An inter-agency collaboration and incentive structures are at the heart of this model for encouraging the uptake of innovative technologies. By doing so, it broadens the debate around environmental policymaking, demanding a calculation of how government, policymakers, and the public can take on an integrated approach to ensure coherence between the ability to deploy cost-effective technologies and environmental protection goals. It provides practical implications for government agencies, industry actors, and academic institutions that utilize innovation-oriented sustainable development to enhance Malaysia's environmental performance.
Keywords: Sustainable development policy; Green technological innovation; Environmental governance.

1. Introduction

Sustainable development in Malaysia has gained heightened attention due to the country's rapid economic growth, necessitating a balance between development and environmental preservation (Khan et al., 2021). The government has initiated various policies to facilitate sustainable practices, particularly in high-impact sectors such as agriculture, manufacturing, and services. The commitment to sustainability is articulated through Malaysia's Vision 2020. It is currently aligned with the Sustainable Development Goals (SDGs) as part of the

framework for a long-term national development strategy. The Malaysian government has laid out a detailed National Environmental Policy to promote the integration of environmental considerations into the national agenda. Recent trends reflect a growing affinity toward adopting green technologies and sustainable practices, aiming to reduce carbon footprints and enhance environmental performance (Idris et al., 2024). For instance, various policies focus on sustainable waste management and green energy initiatives as part of the broader environmental preservation efforts. A notable shift towards sustainable farm practices is evident through programs aimed at enhancing productivity while minimizing ecological impact, in sectors like palm oil and aquaculture (Sani et al., 2024).

Fig. 1. Sustainable Development Goals (SDGs)

The introduction of legislation such as the Environmental Quality Act and the National Policy on Climate Change has further illuminated a path towards greater environmental accountability. Enhanced public awareness and regulatory frameworks have underscored the importance of sustainable approaches in maintaining the ecological balance and fostering economic resilience. However, the transition remains challenging, as sectors grapple with understanding and integrating sustainable practices effectively, often hindered by a knowledge gap, costs, and infrastructural limitations (Masyhur et al., 2024; Tajudeen et al., 2020).

In this context, technological innovation emerges as a pivotal catalyst to drive sustainable practices forward in Malaysia. The role of technology is paramount, as advanced technological solutions have the potential to address environmental challenges comprehensively. Studies emphasize that the integration of innovative technologies can lead to significant advancements in resource efficiency and productivity across various sectors, including agriculture and manufacturing (Lee et al., 2023). For instance, green innovations, such as precision agriculture, leverage data-driven technologies to optimize resource use, significantly impacting crop yields and minimizing the carbon footprint associated with food production. The adoption of such technologies is critical, given Malaysia's dependence on agriculture as a mainstay of its economy (Zainol et al., 2024). Further, linking modern digital technologies with agricultural practices emerges as a viable solution to enhance environmental outcomes while simultaneously improving growers' economic stability (Hamid et al., 2021).

Moreover, research has indicated that the infusion of digital solutions, including Green Information Systems, plays a crucial role in fostering a culture of sustainability within organizations. Proactive management of environmental information through tailored IT

systems helps firms track their sustainability performance efficiently, thereby facilitating better decision-making and compliance with environmental regulations (Gopinathan et al., 2025). This relationship exemplifies the significant impact technology has on promoting a sustainable corporate culture and enhancing organizational performance. Technological innovations also extend to banking practices, with green banking initiatives becoming increasingly prominent in Malaysia's financial sector. This forward-thinking approach not only accentuates the importance of funding for green initiatives but also drives the business case for sustainability within the financial framework. Comprehensive policies encouraging green investments further signal progress in Malaysia's commitment to fostering sustainable economic practices (Khalid et al., 2024).

As industries transition towards low-carbon economies, the connection between innovation and environmental performance cannot be overstated. Numerous case studies illustrate that organizations adopting green technologies tend to observe improved operational efficiency and reduced environmental impacts (Mubarik et al., 2021). For example, studies in the palm oil sector demonstrate that implementing sustainable practices using innovative technologies not only curtails environmental degradation but also enhances the overall economic viability of businesses involved in palm oil production (Mahbob et al., 2021). Importantly, research shows that public sectors remain significant players in advancing sustainability through innovation. Government policies that stimulate research and development in sustainable technologies have demonstrated positive outcomes for the environment, especially regarding pollution reduction and resource conservation (Ong et al., 2022). Therefore, the importance of governmental support for innovation in sustainable practices is clear, as it sets the foundation upon which the private sector can build successful sustainable business models. Technological advancements, therefore, work hand-in-hand with environmental policies to support a comprehensive approach to sustainability in Malaysia. The interplay between innovation, environmental performance, and sustainable practices illustrates a holistic pathway toward achieving long-term ecological goals that align with economic growth (Yadegaridehkordi et al., 2020). As such, fostering a culture of innovation across sectors is imperative to fully leverage the potential benefits technological advancements can offer in meeting sustainability targets effectively and efficiently.

Current literature suggests a pressing need for further investments into research and development to support the evolution of new technologies that promote sustainable practices, especially within the Malaysian context. Only through continued effort and collaboration among stakeholders—including government, industry players, and civil society—can Malaysia hope to achieve its sustainability objectives while driving economic progress into the future.

Malaysia's commitment to addressing environmental sustainability is demonstrated through various regulations and initiatives established over the years. The government has made strides in integrating environmental considerations into national policies, guided by a framework promoting sustainable development. A pivotal catalyst for these efforts is the National Policy on the Environment, launched in 2002, which provides a comprehensive approach to managing environmental issues, including pollution control, biodiversity conservation, and sustainable resource management (Jalil et al., 2025). In recent years, additional initiatives such as the Environmental Quality Act (1974) have been pivotal in regulating pollution, enforcing standards on wastewater treatment, and addressing hazardous waste (Khan et al., 2021). Concurrently, the adoption of environmental impact assessments (EIAs) as a prerequisite for major development projects signifies a forward-looking approach, ensuring that environmental aspects are systematically evaluated before project implementation.

Parallel to these frameworks, public awareness and engagement in environmental issues play a critical role in the success of environmental policies. Initiatives aimed at promoting environmental education and awareness, including campaigns by governmental and non-

governmental organizations, are essential to foster community involvement. Programs that engage local communities in sustainability initiatives, such as tree planting and waste management, have shown promise in raising awareness and promoting responsible practices among citizens (Masyhur et al., 2024). Moreover, economic incentives have formed a crucial part of Malaysia's strategy, where green financing mechanisms are introduced to promote investment in sustainability initiatives. These include tax incentives for businesses adopting environmentally friendly practices and financial support for green technology development (Idris et al., 2024). However, the efficiency of these incentives in translating into practice remains limited, particularly among small and medium enterprises (SMEs).

Despite the progress made in establishing environmental policies, Malaysia faces considerable challenges in implementing sustainable practices. One significant barrier is the lack of awareness and understanding of sustainability principles among the general public and stakeholders (Saad et al., 2024). Research indicates that a large segment of the population lacks adequate knowledge regarding the implications and benefits of adopting green practices, which hampers concerted efforts toward environmental protection. Additionally, limited access to sustainable technologies and financial constraints further impede SMEs from adopting environmentally friendly practices. For instance, SMEs often struggle with the costs associated with implementation, such as acquiring technology that complies with environmental standards (Mubarik et al., 2021). As highlighted by Ojo et al. (2022), despite the presence of policies encouraging green management practices, the actual adoption remains low among SMEs compared to larger corporations, primarily due to resource limitations.

Fig. 2. Green supply chain practices

The existing regulatory framework also presents complexities that create uncertainty for businesses. The multiplicity of regulations can lead to confusion, as companies may be uncertain about compliance requirements, thereby leading to neglect in adhering to environmental standards (Zainol et al., 2024). As a result, firms may adopt a minimal compliance approach rather than proactively engaging in sustainable practices, which can ultimately undermine the effectiveness of environmental initiatives. Public awareness campaigns, although beneficial, often lack depth and reach, further complicating stakeholder engagement in sustainability discourse. Many initiatives focused on education do not sufficiently address the technological aspects necessary for implementing green practices,

leaving gaps in knowledge about how to effectively utilize available technology (Hamzah et al., 2022).

To address the aforementioned challenges, stakeholder engagement plays a critical role in nurturing environmental practices. Engaging local communities and businesses is essential for developing environmentally responsible behaviors and practices. Structured platforms, through which stakeholders can participate in discussions about environmental management, are vital. For instance, local governments could establish regular community forums to deliberate environmental policies and gather input on sustainable practice implementations (Khalid et al., 2024). Additionally, engaging businesses in collaborative initiatives, such as public-private partnerships, serves to leverage resources and knowledge towards common sustainability goals. Successful models from other regions emphasize the potential for enhanced outcomes through such collaborations (Ojo et al., 2022). The involvement of educational institutions in fostering research into sustainable practices further underscores the need for collaborative efforts across sectors to build a comprehensive approach to sustainability.

Academically, studies highlighting the role of green technology adoption demonstrate that SMEs that invest in eco-friendly innovations report improved operational efficiencies and cost savings over time (Mubarik et al., 2021). These findings can encourage local businesses to consider the long-term benefits of adopting green practices, thereby fostering a shift in perspective on sustainability. Overall, the interplay among awareness, economic incentives, and stakeholder collaboration forms the backbone of Malaysia's environmental initiatives. A multi-faceted strategy that layers these components may offer greater resilience and effectiveness in addressing the pressing challenges of sustainable practices. It is essential for Malaysia to continue refining its approach to engaging stakeholders at all levels, ensuring that policies are not only well-crafted but also effectively communicated to all parties involved in environmental stewardship.

An examination of the implementation of green energy initiatives further substantiates this necessity. For example, the uptake of renewable energy technologies has been relatively slow despite favorable policies due to misconceptions regarding feasibility and cost (Tajudeen et al., 2020). Therefore, targeted educational programs highlighting successful case studies of green energy implementations can help demystify the process and encourage broader acceptance among stakeholders. As the nation progresses, future research should focus on longitudinal studies that monitor the effectiveness of current policies and education initiatives over time (Jalil et al., 2025). This understanding will be pivotal in developing responsive and adaptive policies that can promote sustainable practices effectively in the ever-evolving sociopolitical environment of Malaysia.

2. Methodology

The research design plays a critical role in studying sustainability, as it lays the foundation for how data is collected and analyzed. In recent studies, methodologies have utilized both qualitative and quantitative approaches to explore various dimensions of sustainability within Malaysia and have become a conceptual paper. In contrast, quantitative methods are effective in measuring specific variables and establishing relationships through statistical analyses. Surveys, particularly, provide a broad range of data from numerous respondents, allowing researchers to generalize findings across larger populations. For example, a study by Ong et al. (2022) utilized surveys to gauge the attitudes of small and medium enterprises (SMEs) towards sustainability practices. By analyzing data from over 200 firms, the researchers were able to determine factors influencing the adoption of green practices, such as perceived costs and regulatory pressures. Combining both qualitative and quantitative methods in a mixed-methods approach can leverage the strengths of each, providing a comprehensive

understanding of sustainability issues. Researchers may utilize qualitative interviews to gain insights into the motivations behind sustainability practices and then use quantitative surveys to measure the prevalence of these practices across different sectors. This methodological triangulation enhances the validity and reliability of the research findings.

Effective data collection strategies are essential for yielding valuable insights into the state of sustainability in Malaysia. Using a combination of case studies and surveys can significantly enrich the data landscape. For instance, case studies provide contextual richness as they focus on specific instances of sustainability practices within particular organizations. Mahbob et al. (2021) conducted a case study that evaluated energy benchmarking in the Malaysian palm oil industry, helping gain insights into operational practices and the challenges that firms face when attempting to enhance sustainability. Through on-site observations and interviews with key stakeholders, the researchers gathered nuanced data that statistical methods alone may not have revealed. Moreover, employing structured questionnaires in surveys enables researchers to quantify the effectiveness and scope of sustainable practices. As highlighted by Hamzah et al. (2022), surveys were distributed across various SMEs to examine their engagement with sustainable management practices. This included assessing the awareness of environmental issues, adherence to regulatory compliance, and integration of green technologies in operations. The responses gathered were subjected to regression analyses to determine significant predictors of sustainability engagement.

Additionally, leveraging technology in data collection can streamline the process and enhance the accuracy of results. For example, online survey tools can facilitate data gathering from larger populations, particularly in the context of remote work environments, which have become more prevalent due to recent global events. This shift allows for increased flexibility and accessibility, potentially increasing response rates and diversity in sample populations.
Sample Population

Selecting an appropriate sample population is pivotal in sustainability research as it reflects the diversity and scope of the study. In studies focusing on sustainable practices in Malaysia, researchers have predominantly turned their attention to SMEs, which form the backbone of the economy yet often lack the resources to adopt comprehensive sustainability measures. Hamzah et al. (2022) emphasized the necessity for a balanced representation of industries engaged in sustainable practices, including agriculture, manufacturing, and services. By including various sectors, the findings can be generalized across the economic landscape, offering insights relevant to numerous stakeholders. When defining the sample population, researchers should aim for a diversity of company sizes, operational scopes, and geographical locations to capture a comprehensive view of sustainability practices. For instance, studies that incorporate perspectives from both urban and rural SMEs can reveal important differences in challenges and opportunities for sustainable development. As noted by Ramli et al. (2021), socioeconomic factors and localized environmental issues can significantly influence sustainability engagement within different communities.

Furthermore, the rationale behind sample selection should align with the research objectives. If the goal is to explore barriers to sustainable practices, including firms that have unsuccessfully attempted to implement sustainability measures, may offer valuable insights into shortcomings and obstacles. On the other hand, focusing on successful case studies provides data points for best practices that can be modeled by other firms. Researchers, therefore, must carefully consider their criteria for sample selection and ensure that the chosen subjects are representative of the population being studied. Rigorous methods implementing sampling are also pivotal. An example of this practice is through stratified sampling, which may ensure all relevant industry segments are included in the study. By stratifying the sample, researchers can maintain the proportional representation of different sectors, thereby increasing the generalizability of findings. This approach is essential, especially in a country

like Malaysia, which has a multifaceted economic framework and a diverse industrial base involved in various environmental initiatives.

In conclusion, discussions on sample determinants must also consider ethical considerations in research. Transparency in data collection and engagement with participants are fundamental ethical responsibilities that researchers must uphold. Providing a clear outline of how data will be used, ensuring confidentiality, and gaining informed consent from participants enrich the ethical framework of sustainable research (Idris et al., 2024). Ethical clarity strengthens the credibility of research findings and fosters trust between researchers and participants.

3. Results and Discussion

The role of green technology in fostering sustainability has garnered significant attention across various industries in Malaysia. The implementation of green technologies not only reduces environmental impacts but also promotes long-term economic viability. According to Mubarik et al. (2021), green technologies, especially those involving renewable energy sources such as solar and wind power, enhance operational efficiency while reducing greenhouse gas emissions. In the manufacturing sector, for instance, the adoption of green technologies has demonstrated a remarkable reduction in waste production and energy consumption, leading to lower operational costs while contributing to environmental sustainability.

Successful case studies abound that illustrate the positive impacts of green technologies. Mahbob et al. (2021) highlight specific instances in the Malaysian palm oil industry where technologies aimed at improving energy efficiency have been implemented. These changes not only optimized production processes but also aligned with sustainable practices, thereby reducing the overall environmental footprint of the industry. Companies that embraced technological innovations reported enhanced profitability alongside their environmental performance, suggesting a direct correlation between green technology implementation and business benefits.
Furthermore, digital technologies, integrating the Internet of Things (IoT) and data analytics, play a crucial role in advancing sustainable operational practices. These technologies enable real-time monitoring of resource usage, waste management, and energy consumption, thereby empowering organizations to make informed decisions regarding their environmental impact.

Innovations in agricultural practices represent another critical area where technology convergence is forming a new paradigm for sustainability in Malaysia. As the agricultural sector faces increasing pressures due to climate change and resource depletion, advanced technologies pave the way for enhanced productivity and sustainability. Zainol et al. (2024) notes that smart agricultural technologies, including precision farming tools, drone applications for crop monitoring, and advanced irrigation systems, are transforming traditional farming methods. These technologies reduce water use while maximizing crop yields and minimizing environmental degradation. The integration of digital technologies within agricultural practices enables farmers to adopt data-driven strategies. For instance, utilizing algorithms to analyze soil health and crop performance allows for targeted interventions that improve input efficiency (Zainol et al., 2024). As a result, farmers can reduce the amount of fertilizers and pesticides applied, leading to healthier ecosystems and reduced costs associated with unnecessary expenditures.

Moreover, mobile applications assisting in crop management and market access empower local farmers, enhancing their economic conditions while promoting sustainable practices. By fostering communication and innovation among agricultural stakeholders, these technologies help build resilient food systems capable of adapting to changing environmental conditions.

Environmental policies are vital in shaping the adoption of sustainable practices and technological innovations. Ojo et al. (2022) conduct a comprehensive review of existing environmental policies within Malaysia, noting the effectiveness of certain initiatives that encourage innovation among businesses. For instance, regulations that set clear sustainability benchmarks for industries compel organizations to integrate green technologies that meet environmental standards. The authors argue that policies fostering innovation—such as grants for research and development in green technologies or tax incentives for sustainable practices—have proven successful in driving developments within the Malaysian green sector. Khalid et al. (2024) provides a quantitative analysis evaluating the impact of these policies on company performance, revealing a strong correlation between government regulations and the adoption of environmentally sustainable practices. Their research indicates that firms that actively engage with policies promoting environmental sustainability often experience enhanced financial performance, suggesting that a conducive policy environment not only boosts sustainability efforts but also drives economic growth. However, it is essential to recognize the nuances and limitations within the existing frameworks. Policies that lack enforcement or clarity may hinder the intended outcomes. Collaborative approaches that involve various stakeholders, from policymakers to industries and communities, can significantly enhance the effectiveness of these environmental initiatives.

The significance of stakeholder engagement in environmental policymaking cannot be overstated. Masyhur et al. (2024) emphasize that involving communities in decision-making processes fosters a sense of ownership and responsibility toward sustainability initiatives. Engaging stakeholders, including local communities, non-profit organizations, and businesses—ensures a comprehensive understanding of the environmental challenges faced on the ground and encourages better-targeted solutions. Strategies to enhance public participation in sustainability initiatives can vary significantly. For example, educational programs aimed at raising awareness about environmental issues can enlist local communities in collaborative efforts to protect natural resources and promote sustainability. Workshops and outreach campaigns are vital tools to inform stakeholders about sustainability practices, enabling them to contribute actively toward environmental conservation (Masyhur et al., 2024).

Furthermore, leveraging technological platforms for public input in environmental governance empowers communities to share their perspectives and participate in monitoring environmental impacts. Digital engagement channels can facilitate faster communication between governments and communities, ensuring that the voices of all stakeholders are heard in policy formulation. In conclusion, by harnessing the potential of green technologies and nurturing strong stakeholder engagement in policy-making processes, Malaysia can effectively advance its environmental agenda. The interplay between technology, policies, and community initiatives forms a robust framework for achieving sustainability in the face of growing environmental challenges.

In light of the pressing need for enhanced green policies and the adoption of innovative technologies, it is crucial for policymakers to implement robust frameworks that effectively support sustainable practices. To bolster these initiatives, the following recommendations emerge, supported by recent research findings:

1. Development of Comprehensive Green Tax Frameworks: Saad et al. (2024) suggest that the current reliance on tax incentives alone is insufficient. A more dynamic approach that integrates both positive incentives and penalties for unsustainable practices could encourage businesses to adopt greener technologies. An optimal green tax framework should be characterized by elements that encourage compliance while facilitating innovation in environmentally friendly technologies.
2. Empowering SMEs through Financial Support: The positive correlation between environmental performance and financial stability for SMEs has been emphasized in

multiple studies. For example, Lee et al. (2023) highlighted that support from governmental policies has improved the adoption of sustainable practices among firms. Therefore, dedicating financial resources to provide SMEs with grants or low-interest loans can incentivize them to invest in green technologies and training programs that facilitate sustainable practices.

3. Investing in Education and Training Programs: An essential prerequisite for the successful implementation of green policies is educating business owners and employees about sustainability. Masyhur et al. (2024) found that a lack of awareness and understanding often hinders the adoption of green technologies. Thus, integrating sustainability education in the curriculum of vocational training and providing workshops can increase confidence and competence among workforce participants to implement green practices.
4. Enhancing Stakeholder Participation: Engaging various stakeholders, including the community, business owners, and non-governmental organizations, in the environmental policymaking process is critical. Studies like that of Ojo et al. (2022) have shown that participatory approaches lead to policies that are well-received and have a higher implementation success rate. Encouraging public forums and discussions during the policy formulation stage can help tailor solutions to specific community needs and provide feedback mechanisms for future revisions.
5. Promotion of Green Technologies: There exists a need for comprehensive strategies to promote the diffusion of green technologies within industries. Mubarik et al. (2021) outlined various technologies that have successfully reduced environmental footprints. Programs should not just focus on providing subsidies for technology adoption but also on creating awareness campaigns showcasing success stories and the long-term savings and operational benefits associated with green compliance.
6. Regulatory Frameworks to Foster Innovation: Frameworks that stimulate rather than stifle innovation should be developed. The studies emphasize that rigid regulations can lead to innovation stagnation. For instance, Jabir et al. (2022) indicated that flexible regulations allow companies, particularly in the technology sector, to explore novel solutions to meet environmental targets while spurring economic growth. Tailored regulations that reward innovation will ensure that firms remain competitive and environmentally responsible.
7. Long-term Monitoring and Implementation Plans: Effective policies must not only be instituted but continuously monitored for effectiveness. The establishment of metrics to evaluate the impact of policies relating to environmental sustainability enables municipalities and organizations to adapt and cater needed changes proactively (Idris et al., 2024). This alignment of evaluation with policy can ensure that strategies remain relevant and effective over time.

Future investigations are vital to reinforcing the landscape of technology and sustainability in Malaysia. Focused areas for upcoming research, which can significantly contribute to understanding and improving green policies and practices, include the following:

1. Exploring the Role of Emerging Technologies: Research should delve into how emerging technologies, such as artificial intelligence and blockchain, can enhance the sustainability of businesses. Tajudeen et al. (2020) emphasized the growing importance of these technologies in managing supply chains and reducing waste. Investigating the potential applications of such technologies in various contexts can provide foundational knowledge that supports practical applications and policymaking.
2. Impact of Consumer Behavior on Sustainability Initiatives: Analyses related to consumer preferences and their impacts on the adoption of sustainable practices in businesses could yield significant insights. Understanding what drives consumer shifts towards greener products could motivate companies to adjust their practices in alignment with market trends, fostering a win-win situation for both businesses and the environment.
3. Longitudinal Studies on Policy Effectiveness: Long-term studies that track the impacts of sustainability-oriented policies over time are warranted. Such research could provide evidence of the efficacy or shortcomings of certain strategies and guide future

policymaking while providing empirical data that illustrates success stories or necessary adjustments. This area is particularly relevant to communities implementing new policies in diverse sectors (Khalid et al., 2024).

4. Sector-Specific Sustainability Approaches: More comprehensive research is required to understand how different sectors can uniquely adopt and benefit from sustainability practices. For instance, while some sectors might benefit more from technological solutions, others might require a focus on education and community engagement. Specific studies on sectors such as agriculture, manufacturing, and services will ensure policies are tailored to the unique challenges they face. Zainol et al. (2024) indicated that considering sectoral nuances would yield better sustainability outcomes.
5. Barriers to Adoption of Technology: While numerous studies focus on the benefits of adopting new technologies, there is also a clear need to investigate the barriers preventing such adoptions. Understanding these impediments will allow stakeholders to develop targeted strategies that address specific issues, thus enabling smoother transitions to sustainable practices across various sectors (Idris et al., 2024).
6. Interrelation between Policy and Innovation: Research that examines the interplay between policy enforcement and innovation outputs can provide valuable insights into the effectiveness of current regulatory approaches in fostering creativity and technological advancements. This includes analyzing how compliance requirements can both hinder and facilitate innovation trajectories in businesses (Hamzah et al., 2022).

On one hand, environmental policies set the framework and regulations that encourage the adoption of sustainable practices across industries. For instance, the Malaysian government has instituted various sustainability initiatives to improve environmental performance, including the introduction of green financing and tax frameworks to incentivize businesses (Saad et al., 2024). By promoting such initiatives, policymakers can stimulate industries to invest in innovative technologies that support sustainable practices.

On the flip side, the adoption of green technologies provides the necessary tools and methodologies that help firms implement their sustainability strategies effectively. Technological advancements not only enhance operational efficiency but also enable compliance with environmental regulations. For instance, the use of Green Information Systems (Green IS) has been shown to positively influence environmental performance in organizations (Ojo et al., 2022). The fostering of technological innovations sets a foundation for industries to embrace sustainable practices, creating a cyclic pattern of improvement and commitment to sustainability.

Additionally, as industries evolve and incorporate new technologies, they provide feedback to policymakers, which can lead to further refinement and enhancement of environmental policies. As noted by Khalid et al. (2024), the influence of regulatory pressure significantly correlates with the adoption propensity of green innovations. Such interactions underscore the necessity for strategic cooperation between the government, corporations, and stakeholders to realize the full potential of sustainability initiatives in Malaysia.

In light of the evolving dynamics surrounding sustainable practices and technological innovations, it subsequently becomes apparent that further studies are warranted to uncover additional dimensions of this relationship. Future research can delve deeper into the effectiveness of green supply chain practices in the Malaysian context, particularly how they vary across different sectors and how technology can play a role in enhancing these efforts (Mubarik et al., 2021). Research suggests that addressing the complexities and challenges regarding technology adoption could directly correspond to improved environmental outcomes in the long term (Tajudeen et al., 2020).

Moreover, ongoing investigations into stakeholder engagement and community participation in the policymaking process will prove critical for advancing sustainable innovations in

Malaysia. Engaging local communities not only fosters a sense of ownership but also enhances the effectiveness of policies that aim to integrate sustainability into daily practices (Masyhur et al., 2024). Such participatory methods could enrich the feedback loop depicted in Figure 3, creating a more holistic approach to sustainability in the country. In summary, visual representations of sustainable practices and their technological interplay offer vital insights into the patterns and relationships essential for fostering effective sustainability policies in Malaysia. Each figure embodies a facet of the broader narrative that encompasses the interplay of technology, policy, and practices, assisting stakeholders in navigating the complexities of sustainability effectively.

4. Conclusion

In synthesizing the insights from the existing literature, this review underscores the pivotal role of technological innovations in fostering sustainable practices within the framework of Malaysia's environmental policies. The findings indicate a significant relationship between the adoption of green technology and the effectiveness of sustainability initiatives, albeit with notable challenges that need to be addressed, such as public awareness and stakeholder engagement. The emphasis on policy recommendations implores policymakers to create an inclusive environment that encourages innovation and sustainable practices among SMEs and larger corporations. Therefore, the need for longitudinal studies is crucial, as they will provide deeper insights into the long-term impacts of implemented strategies, guiding future efforts in enhancing Malaysia's sustainability agenda.

ANALYSIS OF EQUITY RATIO AND OPERATING EXPENSES RATIO TO NET PROFIT MARGIN IN MSMES RIZKY JUICE FOR THE 2024 PERIOD

Nurul Nusaibah Arub, July Meliza*

Financial Management, Sekolah Tinggi Ilmu Manajemen Sukma, 20219 Medan, North Sumatra, Indonesia

Corresponding author e-mail address: newjuili07@gmail.com

Abstract

This study aims to analyze the financial performance of Rizky Juice MSMEs during 2024 using financial ratios in the form of *Equity Ratio* (ER), *Operating Expenses Ratio* (OER), and *Net Profit Margin* (NPM). The data used are monthly financial statements from January to December 2024 obtained through field observations and direct interviews. The research methodology used in this study is quantitative analysis with a descriptive approach and multiple linear regression. The results of the analysis show that the business has a very strong capital structure, stable operational efficiency, and profitability that increases over time. Multiple linear regression tests showed that ER and OER had a significant influence on NPM, both simultaneously and partially. The R^2 value of 17.4% indicates that the model explains only a small fraction of the NPM variation, so other factors beyond ER and OER need to be explored further. Based on these findings, it is recommended that business owners consider external financing, improve cost control, diversify products, and undergo management training to support sustainable growth.
Keywords: Financial performance; Financial ratios; MSMEs.

1. Introduction

Micro, Small, and Medium Enterprises (MSMEs) have an important role in contributing to employment and income equity in the growth of the real sector. More than 99% of business actors in Indonesia are classified as MSMEs, making them important actors in maintaining economic stability, especially in the midst of global uncertainty. However, MSMEs also have challenges in efforts to optimize finances. Common problems that often occur include weak financial records, a lack of managerial understanding, and low efficiency in controlling operational costs. One of the main obstacles lies in the capital structure that depends on private capital and the difficulty of accessing formal financing. This condition leads to a low *Equity Ratio (ER)* and a high *Operating Expenses Ratio (OER),* which reflects a large operating expense on revenue. This imbalance has the potential to reduce the level of business profitability, especially in generating optimal net profits. Therefore, further analysis of how capital structure and operational cost efficiency affect the profitability of MSMEs is also needed.

In general, profitability is the main indicator in assessing the financial success of a company. This ratio measures a company's ability to profit from various business activities carried out. Profitability also has a strategic role in attracting investors, ensuring business survival, and being the basis for the formulation of short-term and long-term managerial policies. One of the most widely used measures of profitability is *Net Profit Margin* (NPM). NPM is a financial ratio that measures the percentage of net profit to total revenue or sales. In other words, NPM shows how much net profit is generated from each unit of sales.

NPM is an important indicator that reflects the company's effectiveness in managing revenue and reducing overall operating expenses. Even though the company recorded high sales, net profit could still be low if operating costs, interest, or taxes were too large. Therefore,

maintaining a balance between revenue and expense efficiency is key to maintaining optimal NPM. NPMs also have strategic value in decision-making, such as pricing, cost control, and expansion plans. However, in practice, NPM levels vary between companies depending on cost structure, business strategy, and managerial efficiency. This indicates that further analysis of the factors influencing NPM in order to increase profitability on a sustainable basis is needed.

In an effort to understand the factors that affect profitability, ER and OER are two important indicators that are worth analysing. ER reflects the proportion of business funding that comes from its own capital. Theoretically, the higher the ER, the less reliance on debt will decrease, so the interest expense is reduced and the net profit tends to increase. However, in practice, this relationship is not always appropriate. Meanwhile, OER is used to assess business efficiency in managing operational costs to revenue. The lower this ratio, the more efficient the company will be in reducing costs to generate revenue. However, a high OER does not necessarily mean low profitability, especially if the volume of revenue is very large. Therefore, neither ER nor OER necessarily has a linear relationship with profitability, i.e., NPM.

In MSMEs, Rizky Juice shows the importance of this analysis. Despite having good market opportunities, the business experienced profit fluctuations due to an imbalance between capital structure and cost efficiency. In this context, a deeper understanding of the extent to which ER and OER affect NPM is needed so that MSMEs can make more appropriate and sustainable financial decisions. The following is the financial statement data of Rizky Juice's MSMEs, which are analyzed to measure the financial condition of the business during the 2024 period based on financial ratios:

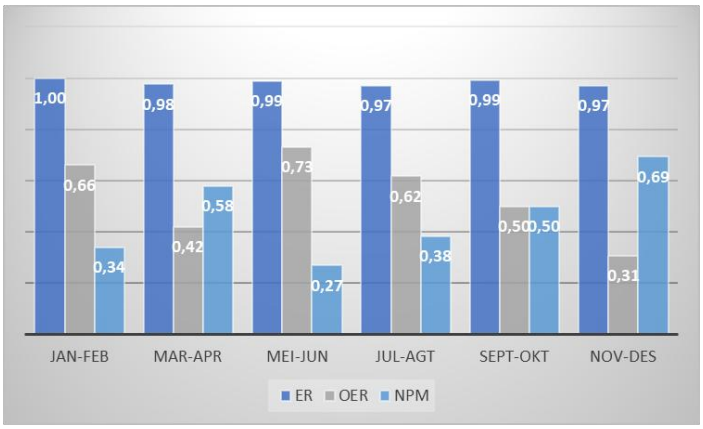

Fig. 1. Analysis Chart of Rizky Juice's MSME Financial Ratio as of 2024

Based on Rizky Juice's MSME financial statement data for 2024, an analysis was carried out on three financial ratios, namely ER, OER, and NPM. The results of the analysis tend to remain at 0.97 to 1.00, indicating that operational efficiency still needs to be improved. Then OER went up and down, with the highest value occurring in May-June (0.73) and the lowest in November-December (0.31). Meanwhile, NPM moved in the opposite direction to OER, which was lowest in May-June (0.27) and highest in November-December (0.69). This shows that the more efficient the operational costs, the greater the profits obtained.

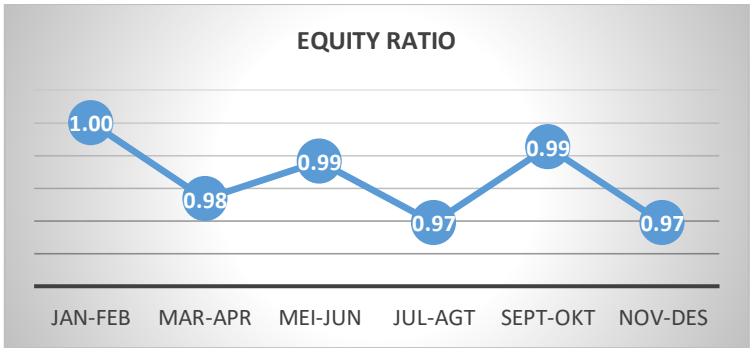

Fig. 2. Equity Ratio Analysis Results

Based on the graph, it can be seen that throughout 2024 the value of the ER shows a pattern in the form of fluctuations with values in the range of 0.97 to 1.00. The highest value was recorded in January–February of 1.00, which indicates that the entire revenue is used to cover operating costs, so the efficiency is very low. Meanwhile, the lowest values were reached in July–August and November–December at 0.97, indicating a slight improvement in efficiency. However, overall, the fluctuations that occurred were very small, indicating that there was no significant change in the company's operational efficiency throughout the year.

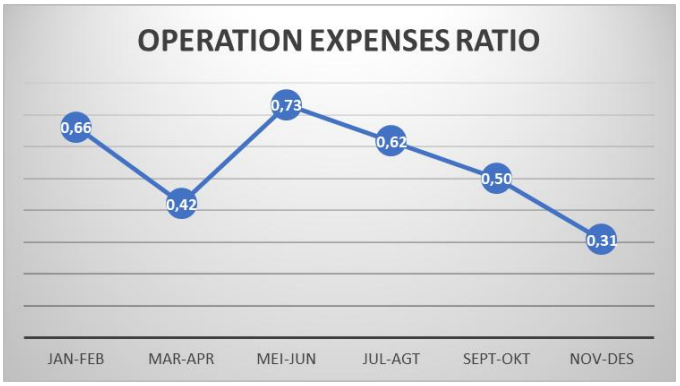

Fig. 3. Operation Expenses Ratio Analysis Results

Furthermore, based on OER analysis, it is evident that the value of the Operating Expense Ratio (OER) exhibits significant fluctuations throughout the year. The highest OER was recorded in the May-June period, at 0.73, indicating a high proportion of operating costs to revenue. In contrast, the lowest OER occurred in November–December at 0.31, indicating more efficient operating expenses. Overall, the month-to-month change in OER reflects differences in effectiveness in controlling operating costs throughout the year.

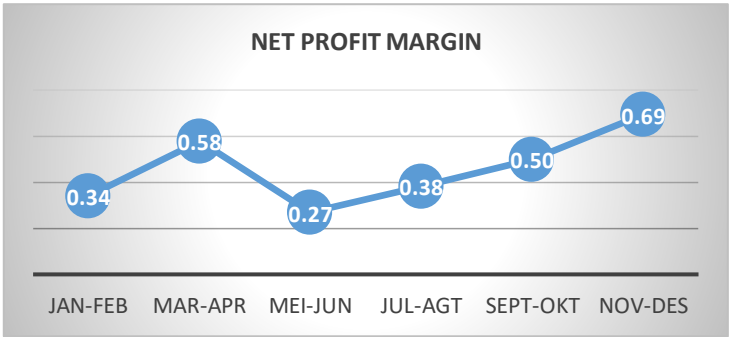

Fig. 4. NPM Analysis Results

Based on the NPM data in the figure, it can be seen that the NPM value fluctuates throughout the year. The lowest NPM occurred in the third period of 0.27, indicating the smallest net profit relative to revenue. Meanwhile, the highest NPM occurred in the last period with a value of

0.69, reflecting the most favorable financial performance. In general, there is an upward trend in NPM towards the end of the year, which indicates an improvement in cost management or an increase in net income. This shows that the company's profitability increases over time.

Through this analysis, it aims to obtain an overview of how much personal capital efficiency (equity) of Risky Juice MSMEs on business assets financed by their own capital compared to the total assets owned, measure how high the level of business operational efficiency is in managing costs on revenue or sales and see an overview of the level of net profit of the business after deducting operational expenses.

2. Methodology

The data in this study are primary and secondary data. Primary Data is direct data obtained by researchers from the first source (Sri Anjarwati et al., 2024). In this study, primary data is in the form of direct interviews with MSME owner Rizky Juice and secondary data through the collection of financial statement documents during 2024, such as cash, equipment, inventory, revenue, and operational costs. The data source used in this study is an internal data source, namely, data obtained from Risky Juice MSME business owners who are the object of direct research. Internal data sources include official company-owned documents that reflect real business activities, such as monthly financial statements, transaction records, and expense recaps (Sri Anjarwati et al., 2024). This internal data is used to calculate financial ratios such as ER, OER, and NPM, which are the main focus of this study's analysis. The population is the whole object in collecting the necessary research data (Sugiyono, 2021). The population in the study is all the financial statements of Rizky Juice MSMEs during 2024. The data includes financial information from January to December.

Samples are a part of the number and characteristics possessed by the population, which are used as a data source in the study (Sugiyono, 2021). In this study, because the population only consists of twelve financial statements of Rizky Juice MSMEs during 2024 (January-December), all population data is used in the analysis. Therefore, the total sampling method is used, which is a technique in which all elements of the population are used as research samples. The use of total sampling was carried out because the amount of data was not too large and was entirely relevant to the purpose of the research.

The data retrieval technique used in this study is a field research method (*Field Research*), which is a data collection technique that is carried out by going directly to the location of the research object to obtain real information (Sugiyono, 2021). This study uses physical observation methods and unstructured interviews to explore financial data from Rizky Juice MSMEs during the 2024 period. The field research method is a data collection technique by conducting a direct review of the field that is the object of the research, in order to obtain data that is in accordance with the research objectives (Kalengkoangan et al., 2021) Unstructured interviews were chosen so that the researcher had flexibility in digging up information, especially regarding financial statements and business operational activities, based on the answers and situations that developed during the interview process.

This research was conducted on one of the MSMEs in the field of healthy beverages, namely Rizky Juice, which aims to analyze the financial performance of the business in the 2024 period. This study uses two independent variables, namely Equity Ratio (ER) as X1 and Operating Expenses Ratio (OER) as X2, as well as one dependent variable, namely Net Profit Margin (NPM) as Y.

1. Equity Ratio (ER)

Equity Ratio is a ratio that describes how much of the company's total assets are financed using its own capital (Ali, Hasan, & Machmud, 2022). This ratio describes the level of

independence of a company in its capital structure and its ability to run operations without a high dependence on external loans. The higher the ER value, the more stable the company's financial condition is because it relies more on internal funds.
This ratio is used to measure solvency, which is the ability of a company to bear all its obligations with its own capital. The formula for calculating ER in this study (Fauziah, 2023):

$$\text{Equity Ratio} = \text{Equity} / \text{Total Assets} \times 100\% \quad (1)$$

Interpretation:
- < 40%: high dependence on debt.
- 40%–60%: balanced capital structure.
- > 60%: predominance of financing by equity, companies tend to be safer.

Thus, ER is used as an indicator of Rizky Juice's level of financial stability in running his business.

2. Operating Expenses Ratio (OER)

Operating Expenses Ratio measures the proportion of operational costs to sales (Faizal. 2022). The greater the value of OER, the greater the portion of revenue used for operating expenses, which can reduce net profit.
The purpose of using OER is to assess the operational efficiency of a company. The calculation formula is (Sulasmy & Cahyaningtyas, 2021).

$$\text{Operating Expenses Ratio} = \text{Operating Expenses} / \text{Net Sales} \times 100\% \quad (2)$$

Interpretation:

i. > 80%: low efficiency, operational load is too large.
ii. 60%–80%: Efficiency is moderate.
iii. < 60%: high efficiency, controlled operational load.

Therefore, OER is used as a reference to assess Rizky Juice's ability to manage business costs efficiently.

3. Net Profit Margin (NPM)

Net Profit Margin is the ratio used in measuring the percentage of net profit to net sales generated by the company (Nurul et al., 2024). The higher the NPM value, the greater the net profit generated after deducting all operating expenses.
This ratio is used to assess the level of profitability of a company. The NPM calculation formula from Pardosi (2021) is:

$$\text{Net Profit Margin} = 100\% \text{ Net Profit} / \text{Net Sales}$$

Interpretation:

i. < 5%: low profitability, small profit margin.
ii. 5%–15%: the profit rate is quite good.
iii. > 15%: high profitability, the company is very efficient in generating profits.

NPM in this study is used as the main indicator to assess financial performance and the level of net profit obtained by Rizky Juice from its business activities.

This study uses a data analysis method with a quantitative approach, namely a research method that utilizes statistical tools and mathematical calculations to measure and describe the analyzed data (Sugiyono, 2021) Meanwhile, the analysis model used in this study uses multiple regression analysis. Before conducting hypothesis testing, it is necessary to first carry

out a classical assumption test. The purpose of this test is to ascertain whether the resulting parameters are valid and reliable. Therefore, if a violation of basic assumptions is found, it is necessary to carry out further testing and adjustments. Classical assumptions tests in regression analysis include normality, multicollinearity, heteroscedasticity, and autocorrelation tests.

The purpose of the normality test is to assess whether the data in the regression model is normally distributed, which is one of the requirements in classical regression analysis (Ghozali, 2021). Because the number of samples of the variable < 50, the results in the statistical test refer to the results of the value *Shapiro-wilk* Namely a statistical test used to test the normality of data. This test calculates the W statistic, which compares the actual data sequence with the expected data sequence if the data were normal.

To determine whether the data is normally distributed or not, the following decision-making basis is used:

i. If the significance value (sig.) is less than 0.05, then H_0 is rejected, which means the data does not follow the normal distribution.
ii. Conversely, if the significance value (sig.) is more than 0.05, then H_0 is accepted, which indicates that the data is normally distributed.

The heteroscedasticity test was carried out to find out whether in the regression model there is a difference in residual variance between observations. If the residual variance is constant from one observation to another, this condition is called homoscedasticity. However, if the variance is not the same, it is called heteroscedasticity. In this test, the white and scatterplot test methods were used.

To find out whether there is a heteroscedasticity problem or not, the basis for decision-making is as follows:

i. If the chi-squared value is calculated to be smaller than the chi-squared table, then it is concluded that there are no symptoms of heteroscedasticity.
ii. If the chi-squared value is calculated to be greater than the chi-squared table, then it is concluded that a symptom of heteroscedasticity occurs.

The multicollinearity test aims to evaluate whether there is a correlation relationship between independent variables in the regression model. Ideally, a good regression model does not show a correlation between its independent variables. This test also aims to measure the tightness of relationships between independent variables through correlation coefficients. In this study, *the Variance Inflation Factor* (VIF) value was used to detect multicollinearity to measure the variability of independent variables as dependent variables and the regression to other independent variables. In general, the critical value used to declare multicollinearity is that if the VIF value is < 10, then multicollinearity does not occur. Meanwhile, if the VIF value is > 10, then multicollinearity occurs (Ghozali, 2021).

The autocorrelation test was performed to detect whether there was a correlation between the residual in one observation and the residual in the other observations in sequence of time. A regression model is said to be good if it does not contain autocorrelation. In this study, autocorrelation testing was carried out using the Durbin-Watson method (DW test). The guidelines for determining whether or not there is an autocorrelation are based on certain criteria, which are described as follows Ghozali, (2021):

Table 1. Hypothesis Null

Hipotesis Nol	Keputusan	Jika
Tidak ada autokorelasi positif	Tolak	0 < d < dl
Tidak ada autokolerasi positif	No decision	Dl < d <du
Tidak ada korelasi negatif	Tolak	4-dl < d< 4

Tidak ada korelasi negatif	No decision	4-du ≤ d ≤ 4-d
Tidak ada autokorelasi positif dan negatif	Tidak ditolak	Du <d<4,-du

Multiple regression is a statistical technique used to evaluate the relationship between several independent variables and one dependent variable. The purpose of this analysis is to find out how much influence independent variables have on dependent variables, either collectively (simultaneously) or separately (partially) (Zulaikha & Hamni, 2022). Here's a model of this analysis equation:

$$Y=a+b1X1+b2X2+e \quad (3)$$

Where:
Y = bound variable (e.g. NPM or profitability)
a = constant (intercept)
b_1, b_2 = the regression coefficient of each independent variable
X_1, X_2 = independent variables (e.g. ER and OER)
e = error (residual)

1. Coefficient of Determination (R2)

R^2 shows how large the proportion of bound variables can be explained by the independent variables in a model. If the value of R^2 is close to 1, then this indicates that the independent variables (X1 and X2) have a strong influence on the dependent variables (Y).

2. Simultaneous Test (f)

The F test is a statistical tool in multiple regression that is used to evaluate whether all independent variables together have a significant influence on the dependent variable. This test was carried out to assess the simultaneous influence of variable X on variable Y.

The basis for decision-making is as follows:
a. If the value of F is calculated ≤ F of the table, then H_0 is accepted and H_1 is rejected, which means that simultaneously independent variables have no significant effect on the dependent variables.
b. If the value of F is calculated > F of the table, then H_0 is rejected and H_1 is accepted, indicating that simultaneously independent variables have a significant effect on the dependent variables.

3. Partial Test (t)

The use of Partial Test aims to see the effect of variable X on variable Y, with the following criteria:
a. If t calculates ≤ t table, then H0 is accepted and H1 is rejected which means that this research is partially ineffective.
b. If t calculates > t table, then H0 is rejected and H1 is accepted, which means that this research is partially influential.

3. Results and Discussion

Based on the results of the calculation of financial statement data on Rizky Juice MSMEs owned by Amiirul Nasution's brother for the 2024 period, using the ER formula. So, the following results were obtained:

Table 2. ER Analysis Presentation Results

Month	Total Equity	Total Assets	ER
JANUARI	Rp2,466,667	Rp2,466,667	1,00
FEBRUARY	Rp2,933,334	Rp2,933,334	1,00
MARCH	Rp4,200,000	Rp4,300,000	0,98
APRIL	Rp4,125,000	Rp4,225,000	0,98
MAY	Rp4,525,000	Rp4,675,000	0,97
JUNE	Rp4,625,000	Rp4,675,000	0,99
JULY	Rp3,612,000	Rp5,160,000	0,95
AUGUST	Rp4,625,000	Rp7,740,000	0,95
SEPTEMBER	Rp3,612,000	Rp3,648,000	0,99
OCTOBER	Rp6,708,000	Rp6,772,000	0,99
NOVEMBER	Rp5,080,000	Rp5,185,000	0,98
DECEMBER	Rp9,434,285	Rp9,629,285	0,98

Based on financial data from January to December, Rizky Juice's business showed a stable and high equity-to-asset (ER) ratio, ranging from 0.95 to 1.00. Highs of 1.00 were observed in January and February, indicating that all assets are financed by equity. In contrast, lows of 0.95 were recorded in July and August, which still indicate healthy financial conditions. The high ER reflects a strong financial structure and minimal reliance on debt, as most assets are financed by the owner's capital, and profits are retained. The average ER is close to 1, indicating that the business is in a good solvency position.

Based on the results of the calculation of financial statement data on Rizky Juice's MSMEs owned by Amiirul Nasution's brother for the 2024 period, using the OER formula. So, the following results were obtained:

Table 3. Presentation Results of OER Analysis

Month	Total Operational C	Total Income	OER
JANUARI	Rp3,533,333	Rp5,000,000	0,71
FEBRUARY	Rp3,561,666	Rp5,295,000	0,33
MARCH	Rp3,800,000	Rp5,300,000	0,72
APRIL	Rp3,700,000	Rp5,825,000	2,74
MAY	Rp3,675,000	Rp6,150,000	0,60
JUNE	Rp3,580,000	Rp6,450,000	0,56
JULY	Rp3,213,333	Rp7,023,333	0,46
AUGUST	Rp3,660,000	Rp8,500,000	0,43
SEPTEMBER	Rp3,442,000	Rp5,960,000	0,58
OCTOBER	Rp3,400,000	Rp8,108,000	0,42
NOVEMBER	Rp3,215,000	Rp5,945,000	0,46
DECEMBER	Rp3,306,000	Rp10,240,285	0,32

From the January to December monthly financial analysis, it is known that Rizky Juice experienced fluctuations in operating costs and revenue, which had an impact on the value of the operating expense to revenue ratio (OER). The OER value varies between 0.32 and 2.74, depending on the month. The highest OER occurred in April (2.74), indicating spending that far exceeded revenue, a condition that reflects inefficiencies or significant sales declines. In contrast, the lowest OER was recorded in December (0.32), indicating that only a small portion of the revenue was used for operations, which means efficiency was excellent. In general, low OER reflects cost efficiency, and from July to December, there is a downward trend and stabilization of OER below 0.60. This indicates consistent cost management improvements in the second half of the year.

Based on the results of the calculation of financial statement data on Rizky MSMEs *Squirrelly* belonging to Amiirul Nasution's brother for the 2024 period using the NPM formula. So the following results were obtained:

Table 4. NPM Analysis Presentation Results

Month	Net Profit	Net income	NPM
JANUARI	Rp1,466,667	Rp5,000,000	0,29
FEBRUARY	Rp1,733,334	Rp5,295,000	0,33
MARCH	Rp1,500,000	Rp5,300,000	0,28
APRIL	Rp2,125,000	Rp5,825,000	0,36
MAY	Rp2,475,000	Rp6,150,000	0,40
JUNE	Rp2,870,000	Rp6,450,000	0,44
JULY	Rp3,810,000	Rp7,023,333	0,54
AUGUST	Rp4,840,000	Rp8,500,000	0,57
SEPTEMBER	Rp2,518,000	Rp5,960,000	0,42
OCTOBER	Rp4,708,000	Rp8,108,000	0,58
NOVEMBER	Rp2,730,000	Rp5,945,000	0,46
DECEMBER	Rp6,934,285	Rp10,240,285	0,68

During the January to December period, Rizky Juice showed a stable profitability performance, with Net Profit Margin (NPM) in the range of 0.28 to 0.68. NPM measures how much net profit is obtained from each rupiah of income. The highest NPM occurred in December (0.68), reflecting remarkable efficiency in converting revenue into profit. On the other hand, the lowest NPM was recorded in March (0.28), which although lower, is still good for the MSME scale.

Throughout May to December, there was a stable and consistent trend of increasing NPM above 0.40. This shows that businesses are becoming more effective in managing costs and increasing net profits. This increase is most likely the result of a good strategy, such as operational efficiency, increased sales, or price adjustments that match the value of the product. In addition, the low OER ratio also supports the achievement of higher profit margins.

Table 5. Normality Test Results

	Kolmogorov-Smirnova			Shapiro-Wilk		
	Statistics	Df	Sig.	Statistics	Df	Sig.
NPM	.122	12	.200*	.957	12	.735

Based on the results of the normality test that has been carried out, the results of the Shapiro-Wilk test have a significance value of 0.735 > 0.05, and the results of the test show normally distributed data. The heteroscedasticity test aims to find out whether in the regression model there is a difference in residual variance between observations. In other words, this test is performed to ascertain whether or not the variance of the error (residual) is constant from one observation to another. Based on the results of the analysis, the heteroscedasticity test through the White method and scatterplot produced the following findings:

Table 6. White Test Results

Type	R	R Square	Adjusted R Square	Std. Error of the Estimate
1	.314a	.098	-.240	.01578

N * *R Square* = 12 * 0.098 = 1.2
Chi-Square Table 7.81473 (Df = 3)

Based on the results above, it is evident that Chi Square < Chi Squared Table (1.2 < 7.81473). Therefore, it is concluded that there are no symptoms of heterogeneity.

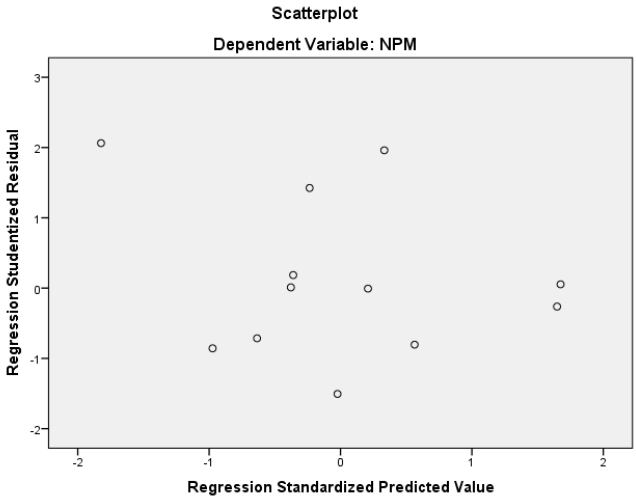

Fig. 5. Scatterplot Test Results

In the scatterplot, the dots are scattered randomly, either above or below the zero line on the vertical axis (Y axis). Therefore, it can be concluded that this regression model does not experience heteroscedasticity problems.

Table 7. Multicollinearity Test Results

Type		Collinearity Statistics	
		Tolerance	VIVID
1	ER	.999	1.001
	OER	.999	1.001

From the table of coefficients obtained, the value of VIF = 1.001. This means that the VIF score is < 10 (1,001 < 10). Thus, it can be concluded that there are no symptoms of multicollinearity among the free variables.

Table 8. Autocorrelation Test Results

Type	R	R Square	Adjusted R Square	Std. Error of the Estimate	Durbin-Watson
1	.511a	.261	.050	.11608	1.778

Based on the Model Summary table, the *Durbin-Watson* value (DW) was obtained as 1.778. By calculating four minus the value of dU (4 - 1.5794), 2.4206 is obtained. Since the DW value is between dU and 4-dU, i.e., 1.5794 < 1.778 < 2.4206, it can be concluded that there are no autocorrelation problems in this model.

Table 9. Multiple Regression Test Results

Type		Unstandardized Coefficients		Standardized Coefficients	t	Sig.	Collinearity Statistics	
		B	Std. Error	Beta			Tolerance	VIVID
1	(Constant)	3.843	2.038		1.885	.092		
	ER	-3.422	2.081	-.451	-1.645	.134	.999	1.001
	OER	-.064	.052	-.333	-1.216	.255	.999	1.001

$$Y= 3.843 - 3.422 X1 - 0.064 X2 \quad (4)$$

i. The constant value of 3.843 indicates that if the variables X1 and X2 are equal to zero, then the predicted value of variable Y is 3.843.
ii. The regression coefficient for the X1 variable of -3.422 means that every one unit increase in X1 will result in a decrease in the Y variable by 3.422.
iii. The regression coefficient for the X2 variable of -0.064 indicates that every one-unit increase in X2 will decrease the value of the Y variable by 0.064, and vice versa.

Table 10. Determination Coefficient Test Results

Type	R	R Square	Adjusted R Square	Std. Error of the Estimate
1	.569a	.324	.174	.11391

The Adjusted R Square value of 0.174 shows that the contribution of independent variables to dependent variables simultaneously is 17%. In other words, about 17% of the variation in dependent variables can be explained by independent variables in this regression model. The Adjusted R Square value of 0.174 means that about 17.4% of the change or variation in variable Y can be explained by the combination of the variables X1 and X2 in this model. In other words, this model is very effective in explaining the relationship between the independent variables (X1 and X2) and the dependent variable (Y). The remaining 82.6% came from factors outside the model, such as other variables that had not been included or errors in the data.

Table 11. Simultaneous Test Results

NEW ERA						
Type		Sum of Squares	Df	Mean Square	F	Sig.
1	Regression	.056	2	.028	12.820	.002b
	Residual	.020	9	.002		
	Total	.076	11			

Sig. of 0.002 (<0.05), it can be concluded that *independent variables* have a significant effect simultaneously on *dependent* variables.

Table 12. Partial Test Results

Type		Unstandardized Coefficients		Standardized Coefficients	t	Sig.
		B	Std. Error	Beta		
1	(Constant)	3.843	.836		4.598	.001
	ER	-3.422	.853	-.682	-4.011	.003
	OER	-.064	.021	-.504	-2.965	.016

a. Dependent Variable: Y1

i. The significance value (Sig.) for the X1 variable is 0.003, which is smaller than 0.05, so it can be concluded that the X1 variable has a significant influence on the Y variable.
ii. The significance value (Sig.) for variable X2 is 0.016, which is also smaller than 0.05, so it can be concluded that variable X2 has a significant effect on variable Y.

4. Conclusion

Based on the analysis of financial statements and statistical tests, it can be concluded that the capital structure of Rizky Juice's MSMEs is relatively strong, with an average Equity Ratio (ER) of approximately 1.00, indicating a low dependence on debt. *The Operating Expenses Ratio* (OER) tends to be efficient when it is below 0.60, despite spikes in costs in certain months. NPM shows a positive trend, with a significant increase at the end of the year. The results of multiple linear regression confirm that ER and OER have a significant influence on NPM, both simultaneously and partially. This research model explains a 17.4% variation in profitability, suggesting that other factors also influence it.

ANALYSIS OF THE EFFECT OF SERVICE QUALITY ON DANA APPLICATION USER SATISFACTION USING THE SERVQUAL DIMENSION

Rizky Irawan*, Mesran

Program Studi Manajemen Informatika, Sekolah Tinggi Ilmu Manajemen Sukma, 20219 Medan, Sumatera Utara, Indonesia

*Corresponding author e-mail address: rizky.i2000@gmail.com

Abstract

This study aims to analyze the effect of service quality on user satisfaction with the DANA digital wallet application, specifically in the city of Medan. Using the SERVQUAL model framework, which includes the dimensions of Tangibles, Reliability, Responsiveness, Assurance, and Empathy, this study measures user perceptions and expectations. Data was collected through a survey of 122 active DANA users in Medan. The results of the multiple linear regression analysis indicate that four SERVQUAL dimensions—Tangibles, Reliability, Responsiveness, and Assurance—have a positive and significant influence on user satisfaction. However, the Empathy dimension does not show a significant influence, indicating that in the context of digital services, functional and technical aspects are prioritized over personal attention. The gap analysis also revealed negative gaps in all dimensions, where users' perceptions of DANA's service performance were still lower than their expectations, with the largest gap in the Reliability dimension. Thus, this study concludes that to improve user satisfaction, DANA needs to prioritize improvements in reliability, responsiveness, security assurance, and application appearance.
Keywords: Service quality; User satisfaction; Digital wallet.

5. Introduction

The development of digital technology has driven transformation in various aspects of life, including in the financial sector. One form of digital innovation that is growing rapidly in Indonesia is the digital wallet (e-wallet), which facilitates fast and practical cashless transactions via mobile devices. According to data from Bank Indonesia (2023), e-wallet transactions have increased by more than 38% in the past year, reflecting the high adoption of app-based financial services among the public.

The rapid development of financial technology (fintech) has changed consumer expectations, demanding not only convenience but also a high-quality service experience. One fintech platform that has gained significant attention in Indonesia is DANA, a digital wallet service that offers various transaction capabilities such as bill payments, transfers, and online shopping. As user adoption increases, especially among young people in urban areas such as Medan, understanding how service quality dimensions affect user satisfaction is becoming increasingly important (Utomo & Yasirandi, 2024).

Service quality plays a central role in determining user satisfaction levels, particularly in the context of digital services. The SERVQUAL model, which encompasses the dimensions of tangibles, reliability, responsiveness, assurance, and empathy, serves as a widely used framework for measuring perceptions of service quality and its impact on customer satisfaction. Recent studies have emphasized the relevance of SERVQUAL in digital environments, including in electronic wallet services such as DANA (Nurcahyo et al., 2023) and within a conceptual framework of user satisfaction based on the gap between perception and expectation (Fainusa et al., 2019).

The significance of this study lies in its focus on the application of DANA in the city of Medan, one of the regions with the fastest growth in digital users in Indonesia. While previous research has examined fintech adoption and user satisfaction at the national level, studies at the regional level remain limited. This research fills this gap by exploring the specific perceptions and expectations of DANA users in Medan, providing insights for the development of locally oriented service design and user experience (Wahyuni et al., 2023).

The novelty of this study lies in its dual approach, combining gap analysis between expectations and perceptions with regression modeling to evaluate the individual influence of each SERVQUAL dimension on user satisfaction. Unlike previous studies that only focused on descriptive or inferential analysis, this study provides a comprehensive picture of how service quality mismatches can manifest as measurable user dissatisfaction (Utomo & Yasirandi, 2024).

Thus, the objectives of this study are: (a) to assess the gap between users' expectations and perceptions of DANA's service quality, and (b) to identify which SERVQUAL dimensions significantly influence user satisfaction. By achieving these objectives, this study aims to provide practical recommendations for improving the quality of digital services on fintech platforms, particularly electronic wallets such as DANA, which face tough challenges in maintaining customer satisfaction and loyalty (Ramadhan et al., 2023).

2. Methodology

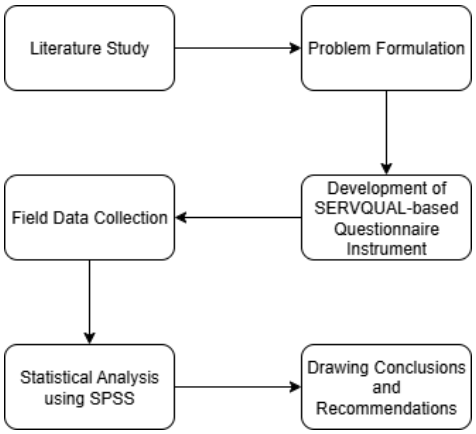

Fig. 1. Research Stages

This research was conducted through several systematic and structured stages to ensure that the process was carried out in accordance with scientific principles. The first stage was a literature study to identify basic concepts related to service quality, customer satisfaction, and the application of the SERVQUAL method to digital and financial services. This study also aimed to identify research gaps in previous literature.

The second stage was the formulation of research problems and objectives based on literature findings and phenomena observed in the field, particularly those related to the user experience of the DANA application in Medan City. From this formulation, hypotheses were established to be tested empirically. The third stage was the development of a questionnaire instrument based on the SERVQUAL dimensions. The indicators in the questionnaire were developed considering the characteristics of digital services, covering two main parts: user expectations and perceptions. The fourth stage is data collection. Data collection was conducted using online and offline survey methods to reach a broader and more representative sample of respondents. The target respondents were active users of the DANA application in Medan City who met specific criteria.

The fifth stage is data analysis. Data is analyzed using SPSS version 22, including validity and reliability testing of the instrument, descriptive analysis, and multiple linear regression to test the influence of the SERVQUAL dimensions on user satisfaction. The final stage is the interpretation of results, drawing conclusions, and formulating practical recommendations that can be used by DANA app managers and other digital wallet industry players. The entire process follows the quantitative framework as suggested by Creswell (Gabel et al., 2014).

User satisfaction is measured as an overall evaluation of the application services used. In the context of digital wallets, satisfaction reflects perceptions of the benefits, convenience, security, and quality of interaction during application use (Setiawan & Trianasari, 2023). DANA is a popular digital wallet in Indonesia, providing services such as payments, top-ups, and transfers. These services are widely used by various groups, making them relevant subjects for studies on user satisfaction and fintech service quality (Wati et al., 2024). SERVQUAL is a service quality measurement model developed by Parasuraman et al. (1988) and covers five main dimensions: tangibles, reliability, responsiveness, assurance, and empathy (Parasuraman et al., 2017). Each dimension is measured through indicators tailored to the digital wallet context.

This study tests five hypotheses, each representing the influence of one dimension of SERVQUAL on user satisfaction:

a) H1: Tangibles have a positive effect on user satisfaction.
b) H2: Reliability has a positive effect on user satisfaction.
c) H3: Responsiveness has a positive effect on user satisfaction.
d) H4: Assurance has a positive effect on user satisfaction.
e) H5: Empathy has a positive effect on user satisfaction.

The questionnaire was divided into two parts: the first part measured expectations and perceptions using a 1–5 Likert scale, and the second part measured user satisfaction. Validity was tested using item-total correlation, and reliability using Cronbach's Alpha. Data analysis was performed using multiple linear regression and gap analysis to measure the difference between expectations and perceptions of service (Hery et al., 2024).

The population in this study includes individuals who are active users of the DANA application residing in Medan City. The population criteria are determined based on users who have actively used the DANA application for more than three months and are over 17 years of age. This population is considered representative for assessing user perceptions of digital wallet services (Setiawan & Trianasari, 2023).

The sampling technique used in this study was convenience sampling, which is a method of selecting samples based on the availability and willingness of respondents to participate in the study. This technique was chosen because it allows researchers to obtain data efficiently from individuals who are easily accessible, especially in the context of financial technology (fintech) studies, where digital users tend to be more responsive and easily accessible through online platforms. The use of this technique is also supported by previous research indicating that convenience sampling is an appropriate approach for recruiting respondents who are users of digital applications, as explained by (Wati et al., 2024). Data collection was conducted through an online survey using Google Forms. The survey link was disseminated through social media and the DANA user community in Medan. This method was chosen because it is efficient and can reach respondents who have direct experience using the application in their daily lives (Sukandar & Febrianta, 2025).

3. Results and Discussion

This study involved 122 respondents who are active users of the DANA app in Medan City. Based on demographic characteristics, the majority of respondents were female (63.1% or 77 people), while males numbered 45 people (36.9%). The majority of respondents were in the 17-25 age group (57.4%), followed by the 26-35 age group (32.8%), and the remainder were over 36 years old (9.8%). The duration of DANA app usage among respondents also varied, with the largest group (42.6%) having used the app for 1 to 2 years. Users with a usage duration of 7-12 months accounted for 27.9%, over 2 years for 23%, and 3-6 months for 6.6%.

Table 1. Characteristics of Respondents

Characteristics	Category	Number	Percentage (%)
Gender	Male	45	36,9%
	Female	77	63,1 %
Age	17 - 25 years	70	57,4 %
	26 - 35 years	40	32,8 %
	> 36 years	12	9,8 %
Duration of Use	3 months – 6 months	8	6,6 %
	7 months – 12 months	34	27,9 %
	1 year – 2 years	52	42,6 %
	> 2 years	28	23 %

Table 2. Validity Test Results

No	Statement Item	Dimensions	Data Types	r-count	r-table	Description
1	The DANA app has an attractive interface and is easy to use.	Tangibles	Perception	0,394	0.1764	Valid
2	The information in the DANA app is presented clearly and is easy to understand.	Tangibles	Perception	0,323	0.1764	Valid
3	The features in the DANA app are comprehensive and easy to use.	Tangibles	Perception	0,456	0.1764	Valid
4	The DANA app rarely experiences disruptions when in use.	Reliability	Perception	0,626	0.1764	Valid
5	Transactions via DANA are carried out according to the promised time.	Reliability	Perception	0,452	0,1764	Valid
6	DANA is reliable for daily transaction needs.	Reliability	Perception	0,471	0,1764	Valid
7	DANA customer service responded quickly to my complaint.	Responsiveness	Perception	0,408	0,1764	Valid
8	The DANA app provides an effective solution when problems arise.	Responsiveness	Perception	0,421	0,1764	Valid
9	The help feature in the DANA app is easy to access.	Responsiveness	Perception	0,479	0,1764	Valid
10	I feel safe using DANA for financial transactions.	Assurance	Perception	0,396	0,1764	Valid
11	I am confident that my personal information is secure when using DANA.	Assurance	Perception	0,399	0,1764	Valid
12	DANA's security system makes me feel confident.	Assurance	Perception	0,477	0,1764	Valid
13	DANA understands my needs as a user.	Empathy	Perception	0,416	0,1764	Valid

No	Statement Item	Dimensions	Data Types	r-count	r-table	Description
14	I felt cared for when I encountered problems using DANA.	Empathy	Perception	0,325	0,1764	Valid
15	DANA shows its concern for user satisfaction.	Empathy	Perception	0,498	0,1764	Valid
16	Digital wallet applications should have an attractive appearance and be easy to use.	Tangibles	Expectations	0,366	0,1764	Valid
17	The information displayed must be clear, concise, and easy to understand.	Tangibles	Expectations	0,528	0,1764	Valid
18	The service features must be comprehensive and easily accessible.	Tangibles	Expectations	0,371	0,1764	Valid
19	Financial transactions must be carried out according to the agreed schedule.	Reliability	Expectations	0,500	0,1764	Valid
20	The application must be reliable for various financial needs.	Reliability	Expectations	0,460	0,1764	Valid
21	The application should rarely experience disruptions during use.	Reliability	Expectations	0,551	0,1764	Valid
22	Customer service must respond quickly to complaints or questions.	Responsiveness	Expectations	0,372	0,1764	Valid
23	Help features should be easily accessible at all times.	Responsiveness	Expectations	0,476	0,1764	Valid
24	The response from the application must be in line with user expectations.	Responsiveness	Expectations	0,517	0,1764	Valid
25	The application must guarantee the security of financial transactions.	Assurance	Expectations	0,493	0,1764	Valid
26	Users' personal and financial information must be kept confidential.	Assurance	Expectations	0,572	0,1764	Valid
27	The application security system must be reliable.	Assurance	Expectations	0,487	0,1764	Valid
28	Applications must understand the specific needs of their users.	Empathy	Expectations	0,399	0,1764	Valid
29	The service should pay attention when users encounter problems.	Empathy	Expectations	0,445	0,1764	Valid
30	The application should demonstrate concern for user comfort.	Empathy	Expectations	0,490	0,1764	Valid
31	I feel cared for as a user by the DANA service.	User Satisfaction	Satisfaction	0,552	0,1764	Valid
32	I am satisfied overall with the DANA app.	User Satisfaction	Satisfaction	0,533	0,1764	Valid
33	I will continue to use the DANA app in the future.	User Satisfaction	Satisfaction	0,332	0,1764	Valid
34	I would recommend DANA to others.	User Satisfaction	Satisfaction	0,471	0,1764	Valid
35	I rarely experience problems when using DANA.	User Satisfaction	Satisfaction	0,442	0,1764	Valid

The validity of the research instrument was tested by correlating each statement item with the total dimension score using an r-table of 0.1764. The validity test results (Table 2) show that all 35 statement items, both for independent and dependent variables, have an r-count value greater than the r-table. This confirms that all questionnaire items are valid and suitable for measurement.

Table 3. Reliability Test Results

Cronbach's Alpha	N of Items
0,742	35

Meanwhile, the reliability of the instrument was measured using Cronbach's Alpha coefficient. Based on Table 3, the Cronbach's Alpha value obtained was 0.742. This value is above the threshold of 0.70, so it can be concluded that the research questionnaire has high internal consistency and is reliable for collecting data.

Table 4. GAP Analysis

No	Dimension	Perception (Mean)	Expectation (Mean)	GAP (P–E)
1	Tangibles	4,33	4,51	-0,17
2	Reliability	4,20	4,49	-0,28
3	Responsiveness	4,24	4,48	-0,24
4	Assurance	4,34	4,50	-0,16
5	Empathy	4,34	4,57	-0,23

GAP analysis (Table 4) was used to measure the difference between user perceptions (P) and their expectations (E) regarding the quality of DANA services. The results show that the GAP values for all SERVQUAL dimensions are negative. This means that users' perceptions of the performance of the DANA application are generally lower than their expectations.
Specifically, the largest gap was found in the Reliability dimension with a GAP value of -0.28. This gap indicates that DANA still faces the greatest challenges in terms of service reliability, such as minimal application disruptions and transaction accuracy, which are least able to meet user expectations. Other significant negative gaps were found in the dimensions of Responsiveness (-0.24), Empathy (-0.23), Tangibles (-0.17), and Assurance (-0.16). Collectively, these findings indicate that there is substantial room for DANA to improve the quality of its services in all dimensions in order to meet and exceed user expectations.

Table 5. Normality Test Results (Kolmogorov-Smirnov)

		Unstandardized Residual
N		122
Normal Parameters[a,b]	Mean	0,0000000
	Std. Deviation	1,24002773
Most Extreme Differences	Absolute	0,079
	Positive	0,035
	Negative	-0,079
Test Statistic		0,079
Asymp. Sig. (2-tailed)		0.058[c]

The Kolmogorov-Smirnov test (Table 5) shows a significance value of Asymp. Sig. (2-tailed) of 0.058. Since this value is greater than 0.05, it can be concluded that the residual data is normally distributed.

Table 6. Multicollinearity Test Results (VIF - Variance Inflation Factor)

Model		Collinearity Statistics	
		Tolerance	VIF
1	Tangibles	0,701	1,427
	Reliability	0,591	1,693
	Responsiveness	0,698	1,432
	Assurance	0,630	1,587
	Empathy	0,698	1,432

Based on Table 6, the Variance Inflation Factor (VIF) values for all independent variables range from 1.427 to 1.693, all of which are below 10. The tolerance values are also above 0.1. These results indicate that there is no high correlation between the independent variables, so the model is free from multicollinearity.

Table 7. Heteroscedasticity Test Results (Gleiser Test)

Model		Unstandardized Coefficients		Standardized Coefficients	t	Sig.
		B	Std. Error	Beta		
1	(Constant)	2,683	1,027		2,613	0,010
	Tangibles	-0,088	0,075	-0,127	-1,181	0,240
	Reliability	0,008	0,060	0,017	0,141	0,888
	Responsiveness	-0,125	0,064	-0,211	-1,957	0,053
	Assurance	0,033	0,075	0,050	0,443	0,659
	Empathy	0,040	0,067	0,063	0,586	0,559

The Glejser test (Table 7) was used to detect heteroscedasticity. The results show that the significance value for each independent variable is above 0.05. Therefore, it can be concluded that there is no heteroscedasticity in the model, which means that the residual variance is constant.

Table 8. Coefficient of Determination (Model Summary)

Model	R	R Square	Adjusted R Square	Std. Error of the Estimate
1	0.653[a]	0,426	0,401	1,266

The regression analysis results (Table 8) show a correlation coefficient (R) value of 0.653 and a coefficient of determination (R2) value of 0.426. These values indicate that 42.6% of user satisfaction variation can be explained by a model consisting of the dimensions of Tangibles, Reliability, Responsiveness, Assurance, and Empathy.

Table 9. F Test Results (Anova)

Model		Sum of Squares	df	Mean Square	F	Sig.
1	Regression	138,040	5	27,608	17,213	.000[b]
	Residual	186,058	116	1,604		
	Total	324,098	121			

The F test (Table 9) tests the significance of the influence of all independent variables simultaneously. With an F value of 17.213 and a significance of 0.000, which is less than 0.05,

the hypothesis stating that SERVQUAL dimensions collectively have a significant effect on user satisfaction is accepted.

Table 10. T Test Results (Coefficientsa)

Model		Unstandardized Coefficients B	Unstandardized Coefficients Std. Error	Standardized Coefficients Beta	t	Sig.
1	(Constant)	6,353	1,807		3,516	0,001
	Tangibles	0,416	0,132	0,266	3,162	0,002
	Reliability	0,230	0,106	0,199	2,172	0,032
	Responsiveness	0,290	0,112	0,217	2,583	0,011
	Assurance	0,281	0,132	0,189	2,133	0,035
	Empathy	-0,034	0,119	-0,024	-0,284	0,777

Hypothesis testing (H1-H5) was conducted partially by examining the significance value (Sig.) of each independent variable (Table 10):

a) H1 (Tangibles): The Tangibles variable has a significance value of 0.002 and a positive regression coefficient (B) of 0.416. Since the significance value is < 0.05, H1 is accepted. This means that the appearance and physical features of the application partially have a positive and significant effect on user satisfaction.
b) H2 (Reliability): The Reliability variable has a significance value of 0.032 and a positive regression coefficient of 0.230. Since the significance value is < 0.05, H2 is accepted. This indicates that the reliability and consistency of the service have a positive and significant influence on user satisfaction.
c) H3 (Responsiveness): The Responsiveness variable has a significance value of 0.011 and a positive regression coefficient of 0.290. Since the significance value is < 0.05, H3 is accepted. This means that the speed and responsiveness of the service have a positive and significant influence on user satisfaction.
d) H4 (Assurance): The Assurance variable has a significance value of 0.035 and a positive regression coefficient of 0.281. Since the significance value is < 0.05, H4 is accepted. It can be concluded that security and trust have a positive and significant influence on user satisfaction.
e) H5 (Empathy): The Empathy variable has a significance value of 0.777 and a negative regression coefficient of -0.034. Since the significance value is > 0.05, H5 is rejected. This result indicates that personal attention and understanding of users' specific needs do not have a significant influence on user satisfaction.

These findings indicate that four out of five SERVQUAL dimensions have a positive and significant influence on user satisfaction, while the Empathy dimension does not show a significant influence in the context of DANA's digital services in Medan City. This provides important insights into the aspects of service that are most valued by users of digital wallet applications.

This discussion section integrates findings from data analysis with theoretical foundations and previous research to provide an in-depth interpretation. The main finding of this study is that most SERVQUAL dimensions significantly influence user satisfaction, despite the gap between expectations and perceptions. The results of the multiple linear regression analysis show that four of the five SERVQUAL dimensions have a positive and significant influence on user satisfaction. The Tangibles, Reliability, Responsiveness, and Assurance dimensions have significance values below 0.05, confirming the acceptance of hypotheses H1 to H4. These findings are consistent with the SERVQUAL model, which places service quality as the main predictor of customer satisfaction. Specifically, the significance of Reliability underscores

the importance of digital service reliability, while the positive influence of Responsiveness and Assurance aligns with research evaluating determining factors in digital payment services.

Although the regression analysis shows a positive and significant influence, the GAP analysis results provide a different perspective. Negative gaps in all dimensions indicate that user expectations have not been fully met. The largest gap in the Reliability dimension (-0.28) is noteworthy, as although this dimension is important in enhancing satisfaction, DANA is still deemed to be suboptimal in meeting user expectations regarding service reliability. This situation implies a risk of dissatisfaction if performance in this area is not improved.

On the other hand, the most notable and distinguishing finding in this study was the rejection of hypothesis H5, in which the Empathy dimension, with a significance value of 0.777, was found to have no significant effect on user satisfaction. This result provides important insights in the context of digital services, where users of digital wallet applications tend to prioritize functional and technical aspects, such as reliability, security, and ease of use, over personal attention, which is the core of the empathy dimension. Although previous studies have emphasized the importance of empathy, in the context of the DANA application, this factor is not the primary driver of satisfaction. This finding reflects the characteristics of technology-based services, where efficiency, security, and speed are the primary focus for users, rather than individual attention or personal interaction. A study by Sroeurn and Kohsuwan (2025) in the digital finance sector in Cambodia also found that the empathy dimension had the least influence compared to other dimensions on user satisfaction (Sroeurn & Kohsuwan, 2025). Similar findings were reported by Tjendana and Pranitasari (2024), who stated that empathy and assurance were not significant in influencing customer satisfaction in the digital transportation sector in Indonesia (Yandi Tjendana & Diah Pranitasari, 2024).

Overall, this study successfully achieved its objectives, namely assessing the gap between expectations and perceptions and identifying the SERVQUAL dimensions that significantly influence user satisfaction. The analysis results provide practical recommendations for DANA app managers to prioritize improvements in the Tangibles, Reliability, Responsiveness, and Assurance dimensions to enhance user satisfaction, while noting that the Empathy aspect plays a less significant role in this digital service context.

4. Conclusion

Based on the data analysis and discussion, this study concludes several key points regarding the influence of DANA service quality on user satisfaction:

a) Service Quality Gap: GAP analysis shows that there is a negative gap between user expectations and perceptions across all SERVQUAL dimensions. This indicates that the quality of DANA's service as perceived by users has not yet fully met their expectations. The largest gap was found in the Reliability and Empathy dimensions.
b) Significant Influence: The results of the multiple linear regression test show that four out of five SERVQUAL dimensions have a positive and significant influence on DANA user satisfaction. These dimensions are Tangibles (application appearance and features), Reliability (service reliability and consistency), Responsiveness (service speed and readiness), and Assurance (security guarantees). This indicates that improvements in these aspects will directly contribute to increased user satisfaction.
c) Not Significant: The Empathy dimension (personal attention and understanding of user needs) does not have a significant influence on user satisfaction. This finding suggests that in the context of digital wallet services, which prioritize functional and technical interactions, personal and empathetic aspects are not the primary determinants of satisfaction.

In summary, to improve user satisfaction, DANA application managers need to prioritize improvements in reliability, responsiveness, security assurance, and application appearance.

Existing gaps, especially in the Reliability dimension, should be the focus of improvement to ensure that services not only meet but also exceed user expectations in a highly competitive market.

THE EFFECT OF REVENUE GROWTH AND NET INCOME GROWTH ON FIRM VALUE AT TUTORING INSTITUTIONS AT PT XYZ

Sharon Rafuli Hutahaean, Nurhayati*

Financial Management, Sekolah Tinggi Ilmu Manajemen Sukma, 20219 Medan, North Sumatra, Indonesia

Corresponding author e-mail address: nurhayati@stimsukmamedan.ac.id

Abstract

This study examines the effect of revenue growth and net income growth on firm value at tutoring institutions under PT XYZ from the first quarter of 2023 to the fourth quarter of 2024. Using a quantitative approach, this study analyses secondary data from the company's quarterly financial statements. Multiple linear regression analysis, classical assumption test, and hypothesis testing wee used as analysis methods. The mode fe.sibility test confirmed that the regression model was appropriate, and the classical assumption test results showed that all variables met the required assumptions. Hypothesis testing reveals that revenue growth and net income growth have a positive and statistically significant impact on firm value. This study concludes that these financial growth indicators simultaneously contribute to an increase in firm value. Based on these findings, PT XYZ is encouraged to implement strategies that promote revenue and profit growth to increase firm value.
Keywords: Revenue; Net Income; Value.

1. Introduction

In the era of more dynamic business competition, corporate value is an important indicator in assessing the success and sustainability of a company. Not only is attention to corporate values applicable to the large industrial sector, but it has also begun to be applied to non-formal educational institutions, such as tutoring. PT XYZ is one of the tutoring institutions that has experienced rapid growth in recent years. This growth raises questions about how internal financial performance, particularly revenue growth and net income growth, contributes to firm value in the context of educational service institutions.

Revenue growth indicates the company's ability to increase, revenue over time and reflects the effectiveness of sales strategies and competitiveness in the education services market (Majka, 2024). Revenue growth as one of the growth ratios is a ratio that shows an increase in revenue that can be achieved by a business entity (Sari et al, 2020). Based on Prihartanty & Rusmanto (2020), profit growth is a measure of the performance of a company to calculate future profits using profits in the previous period. On the other hand, net income growth reflects operational efficiency and overall resource management (Morningstar, 2023). Although these two indicators are commonly used in financial performance analysis, studies linking them to firm value in the non-formal education sector are limited.

Previous research provides mixed results. Suryani et al. (2023) in their research on the food and beverage sector on the Indonesia Stock Exchange showed that profitability has a significant effect on firm value, while sales growth does not have a significant effect. Widyaningsih & Sari (2024) who examined the energy sector concluded that company growth and governance affect firm value, but profit growth has no significant effect. In contrast, Timothy and Setyawan (2020) in a study of manufacturing companies found that earnings growth has a positive and significant effect on firm value.

The differences in the results of these studies indicate that further studies are still needed in sectors that have different operational characteristics, such as non-formal education institutions. PT XYZ was chosen as the object of research due to the availability of adequate and relevant financial data to be analyzed. This study specifically aims to determine the effect of revenue growth and net income growth on firm value, both partially and simultaneously.

The firm value in this study is measured by two financial indicators, namely Return on Assets (ROA) and Net Profit Margin (NPM). ROA measures how efficiently the company generates profit from its total assets (Ekuid, 2025), while NPM shows the percentage of net profit to sales as a measure of operational efficiency (Syaikhoni, 2024). These two indicators are considered appropriate for describing firm value in the context of sustainability-oriented institutions and long-term financial performance. As a result, this study is expected to contribute to enriching academic and practical understanding of the effect of financial growth on firm value in non-formal educational institutions, as well as a reference in making more strategic decisions in similar organizations.

2. Methodology

This research was conducted at PT XYZ, a tutoring institution located at Jalan Jenderal Besar A. H. Nasution No. 10, Medan. This location was chosen because PT XYZ is an institution that actively organizes non-formal education services and has a complete and structured internal financial report, making it suitable to be the object of an in-depth case study.

This research uses a quantitative approach with a case study design. The sampling technique was carried out by non-probability sampling with a purposive sampling method. The sample used is the quarterly income statement of PT XYZ during 2023 and 2024. The sample selection was based on the availability and completeness of financial data relevant to the research variables. Because this research focuses on one institution without comparison between units, the population and sample are identical in the form of historical financial data from one object of study.

This research involves three main variables: two independent variables and one dependent variable. The independent variables consist of revenue growth and net income growth. The dependent variable is firm value. Each of the variables has the following indicators:

Revenue growth is measured using the percentage change in revenue between periods with the formula:

$$Revenue\ Growth = \left(\frac{Revenue\ This\ Year - Revenue\ Last\ Year}{Revenue\ Last\ Year}\right) \times 100\% \quad (1)$$

Net income growth is measured by the percentage change in net income between periods with the formula:

$$Net\ Income\ Growth = \left(\frac{Net\ Income\ This\ Year - Net\ Income\ Last\ Year}{Net\ Income\ Last\ Year}\right) \times 100\% \quad (2)$$

Firm value is measured using two financial indicators, namely Return on Assets (ROA) and Net Profit Margin (NPM), each calculated using the formula:

$$ROA = \frac{Net\ Income}{Total\ Assets} \quad NPM = \frac{Net\ Income}{Sales} \times 100\% \quad (3)$$

Data was collected through two main methods. First, documentation from internal companies in the form of quarterly profit and loss statements of PT XYZ was collected directly from the company's finance department. This data has gone through an internal audit process and is considered valid. Second, a literature study was conducted to support the theoretical basis and strengthen the analysis by referring to journals, textbooks, accounting standards, and

previous research relevant to the variables studied. The data analysis technique used in this research is multiple linear regression analysis to test the effect of revenue growth and net income growth on firm value. The regression model used in this research is:

$$Y = \alpha + \beta 1X1 + \beta 2X2 + \varepsilon \quad (4)$$

Dimana: Y = Firm Value
$X1$ = *Revenue Growth*
$X2$ = *Net Income Growth*
α = Constant
$\beta 1, \beta 2$ = Regression Coefficient
ε = Error

Before performing regression, the model is tested with a series of classical assumption tests which include normality test, multicollinearity test, and heteroscedasticity test. The normality test was carried out with Shapiro-Wilk because the number of samples < 50. Multicollinearity test is seen from the Tolerance Value and Variance Inflation Factor (VIF), while the heteroscedasticity test is carried out using the Glejser method.

The hypothesis in this research is tested through two main statistical techniques, namely the F test for simultaneous influence and the t test for the partial influence of each independent variable on firm value. The dedecision-making criteria refer to the significance value (Sig.) <0.05 to state a significant influence. In addition, the coefficient of determination (R^2) is used to see the extent to which a combination of independent variables can explain variations in firm value.

The entire data processing process was carried out using the latest version of SPSS software. SPSS was used to run regression analysis, classical assumption test, hypothesis testing, and calculating the coefficient of determination and significance of each variable.
Through a systematic method and measurable analysis, this research is expected to be able to provide a clear picture of the relationship between revenue growth and net profit on firm value in non-formal education institutions, especially in the PT XYZ environment.

3. Results and Discussion

This test was conducted to investigate the impact of revenue growth and net income growth on firm value at PT XYZ, a tutoring institution. The following is a table of multiple linear regression tests, such as:

Table 1. Multiple linear regression test

Model	Unstandardized Coefficients		Standardized Coefficients	t	Sig.	Collinearity Statistics	
	B	Std. Error	Beta			Tolerance	VIF
Revenue Growth	-6.639	.000	-.183	-4.751	.005	.693	1.442
Net Income Growth	1.442	.000	1.087	28.198	.000	.693	1.442

Based on the test results from the two tables above, the multiple linear regression equation is obtained as follows:

$$Y = 0{,}382 - 6{,}639XI + 1{,}442X2 \quad (5)$$

The constant value of 0,382 indicates the value of the company when revenue growth and net income growth are zero. The revenue growth coefficient is negative (-6,639), which means that an increase in revenue growth reduces firm value. Conversely, net income growth has a positive coefficient (1,442), indicating that an increase in this metric will also increase firm

value. Therefore, net income growth has a positive effect, while revenue growth has a negative effect on firm value. The normality test is carried out to ensure that the revenue growth (X_1), net income growth (X_2), and firm value (Y) data are normally distributed. The regression model is considered good if the data follows the diagonal line pattern on the plot, which shows a distribution close to normal. The following is a normality test, which are:

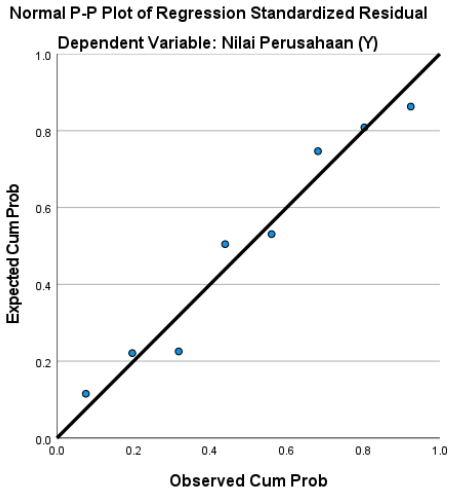

Fig. 1. Normality test

Based on Figure 1, the points (plots) follow the direction of the diagonal line, which means that the regression model is normally distributed. The multicollinearity test is carried out to determine whether there is a correlation between the independent variables. If the tolerance value > 0,10 and VIF < 10, then there is no multicollinearity (Ghozali, 2021). The following is a multicollinearity test:

Table 2. Multicollinearity test

Model	Unstandardized Coefficients		Standardized Coefficients	t	Sig.	Collinearity Statistics	
	B	Std. Error	Beta			Tolerance	VIF
(Constant)	.382	.114		3.35	.020		
Revenue Growth	-6.639	.000	-.183	-4.75	.005	.693	1.442
Net Income Growth	1.442	.000	1.087	28.19	.000	.693	1.442

From Table 2 above, the VIF value for revenue growth and net income growth is 1,442, and the tolerance value is 0,693. Because all VIF values < 10 and tolerance > 0,1, it can be concluded that there is no multicollinearity in the regression model. The heteroscedasticity test aims to test whether the residuals have the same variance between observations. The model is considered good if there is no specific pattern and the points spread randomly above and below the Y axis (Ghozali, 2021). The following is a heteroscedasticity test based on the firm value indicator:

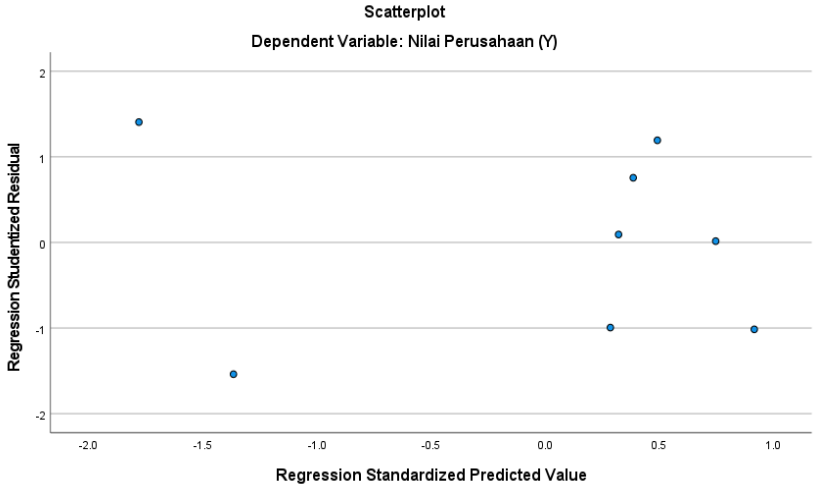

Fig. 2. Heteroscedasticity test

From Fig. 2, the dots do not form a clear pattern, and the dots spread above and below the number 0 of the Y axis, so it can be concluded that there is no heteroscedasticity in the regression model.

The F test is used to test the simultaneous effect of revenue growth and net income growth on firm value. Significant results are shown if the significance value is < 0,05, which means H_0 is rejected and H_a is accepted. The following are the results of simultaneous hypothesis testing:

Table 3. F-test

Model		Sum of Squares	df	Mean Square	F	Sig.
1	Regression	7.554	2	3.777	482.632	.000[b]
	Residual	.039	5	.008		
	Total	7.593	7			

From table 3 above, the F test results show an F_{count} of 482,632 with a significance of 0,000. Because the significance value < 0,05, H_0 is rejected and H_a is accepted. This means that simultaneously, revenue growth and net income growth have a significant effect on firm value at PT XYZ. The t-test is used to test the partial effect of revenue growth (X_1) and net income growth (X_2) on firm value (Y). If the significance < 0,05, then H_0 is rejected, indicating a significant effect. If > 0,05, then H_0 is accepted. The following are the results of simultaneous hypothesis testing:

Table 4. The t-test

Model		Unstandardized Coefficients		Standardized Coefficients	t	Sig.	Collinearity Statistics	
		B	Std. Error	Beta			Tolerance	VIF
1	(Constant)	.382	.114		3.352	.020		
	Revenue Growth	-6.639	.000	-.183	-4.751	.005	.693	1.442
	Net Income Growth	1.442	.000	1.087	28.198	.000	.693	1.442

The t-test results produce a regression equation Y = 0,382 - 6,639X_1 + 1,442X_2. The revenue growth variable (X_1) has a t_{count} of -4,751 with a significance of 0,005, and net income growth (X_2) has a t_{count} of 28,198 with a significance of 0,000. Since both are < 0,05, H_0 is rejected. This means that both revenue growth and net income growth have a significant effect on firm value at PT XYZ. Determination analysis in multiple linear regression is used to determine the percentage of variance in the dependent variable that is simultaneously explained by the independent variables. The following is the result of the coefficient of determination:

Table 5. Results of the coefficient of determination

Model	R	R Square	Adjusted R Square	Std. Error of the Estimate
1	.997[a]	.995	.993	.088465106727164

Table 5 shows the coefficient of determination (R^2) of 0,995, meaning that 99,5% of the variation in firm value can be explained by revenue growth and net income growth, while 0,5% is influenced by other variables outside the model. When compared with previous research, the results of this study show some similarities and differences. Felix Liong et al. (2023) found that income growth has no significant effect on firm value, in contrast to this study which actually shows a significant, albeit negative, effect on firm value.

The results of this research are also in line with those of Mia Agustina Haryono and Indawati (2024), which indicate that earnings growth has a significant positive effect, similar to the net income growth observed in this study. The results of Mutia Rizky Nurul Mutifa and Januar Eko Prasetio (2024) which state that sales growth has no significant effect are different from the results of this study, although both of them use the firm value variable as the output. The other similarity is seen in the research of Putu Sarah Meilany Benggu and Ni Nyoman Ayu Diantini (2024), which shows that profitability has a positive effect on firm value, in line with the significant effect of net income growth in this study.

Meanwhile, Saladin Ahmad et al. (2024) stated that sales growth has a positive effect, in contrast to the results of this study where revenue growth has a negative effect. This shows the importance of considering the industry context, where the non-formal education sector has different financial and operational characteristics. Overall, the results of this study confirm that net income growth is the dominant factor in influencing firm value, while revenue growth requires a more contextual approach in its implementation.

4. Conclusion

Based on the results of the discussion, it can be concluded that revenue growth and net income growth have a significant effect on firm value. So the results of this research suggest that PT XYZ should evaluate its revenue growth strategy because the results show a negative effect on firm value. The company also needs to improve operational efficiency to encourage net income growth. In addition, it is recommended to build a financial monitoring system that contains indicators of revenue growth, net income growth, return on assets, and net profit margin to support more responsive and data-based decision-making.
